BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., JANUARY, 1911.

No. 1.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	-	-	-	\$1.00 per year
Foreign countries,	-	-	-	1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.	-	-	MONTREAL, QUE., CAN.
378 ST. PAUL STREET,	-	-	LONDON, ENG.
19 AND 20 GREAT PULTENEY STREET, W.,	-	-	SYDNEY, N. S. W., AUSTRALIA.
125 YORK STREET,	-	-	

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY.

RENTAL OF \$110,000 A YEAR!

In the November BULLETIN we commented on the minimum rental of \$30,000 a year which the new Riker & Hegeman combination had contracted to pay for one of its new stores at the corner of Broadway and Dey Street in New York. Some years ago, during the life of the late W. H. Burke, it was said that the Central Drug Co., of which he was president, was paying a rental of \$40,000 a year for its Chicago store at the corner of State and Washington Streets. Now another great jump upward has been taken by the United Drug Co. of Boston, which has agreed to pay the enormous

annual rental of \$110,000 for the first floor of the new Greeley Square Hotel in New York City at the corner of 6th Avenue and 34th Street. The lease is to run for 21 years, and Mr. Liggett, president of the United Co., says that he considers this the most prominent corner in the United States, that under the circumstances the rental is cheap, and that already he has been offered an advance of 10 per cent by others. The store will have a floor space of 5500 square feet, so that the rental will amount to \$20 a square foot a year.

It may be said that the United Drug Co. is also renting other stands in New York and Boston, and its attitude is one of significance. It means that the company, dissatisfied with the extent to which the Riker people are pushing the Rexall goods, will establish retail depots of its own in the two Riker cities. The Riker agency for the Rexall products has been a matter of litigation in the courts for over a year, and until the two suits now pending have been settled it seems quite probable that the United Drug Co. can do nothing. Evidently, however, it is getting ready to open stores as soon as the litigation has been disposed of, and this means business competition in the retail drug trade on a pretty big scale. At one time it looked as though the Liggett or United group of 30 or more stores would be absorbed in the Riker & Hegeman combination, but, this failing, it is now clear that strong competition is to take the place of friendly amalgamation.

* * *

RIKER AND LIGGETT LITIGATION.

In the meantime the litigation between the Riker concern and the United Drug Co. is slowly developing. The United Co. recently filed an answer to the complaint of Riker in the injunction suit brought by the latter, and the interesting feature of the reply is found in a statement denying that the United Drug Co. is a coöperative concern. It is declared that the company is not now, and never has

been, a coöperative organization, that the articles manufactured and sold by it have never been distributed exclusively to its own stockholders at uniform prices, and that the number of stockholders has not necessarily been limited to one in each city or town.

The fight between these two big interests is an exceedingly engrossing one and the outcome will be awaited with a good deal of anticipation by the trade generally. Meanwhile the United Drug Co. announces that it is soon to begin the erection in Kansas City, Mo., of a plant for the manufacture of drugs and candies for the western stockholders. The reason for this is declared to be the enormous bills for freight between Boston and Chicago and still more westerly points.

While speaking of these combination movements in the drug trade it may not be uninteresting to report that the A. Spiegel Co. has opened the third of its chain of drug stores in Milwaukee at 126 Wisconsin Street. This is said to be one of the handsomest and best appointed pharmacies in the city.

* * *

**PRESIDENT TAFT
FAVORS A
PARCELS POST.**

In case our readers did not happen to see that portion of President Taft's annual message to Congress touching upon the parcels post, we are reproducing it verbatim:

With respect to the parcels post I respectfully recommend its adoption on all rural delivery routes, and that 11 pounds—the international limit—be made the limit of carriage in such post, and this with a view to its general extension when the income of the post-office will permit it and the postal savings banks shall have been fully established. The same argument is made against the parcels post that was made against the postal savings bank—that it is introducing the government into a business which ought to be conducted by private persons, and is paternalism.

The post-office department has a great plant and a great organization, reaching into the most remote hamlet of the United States, and with its machinery it is able to do a great many things economically that if a new organization were necessary it would be impossible to do without extravagant expenditure. That is the reason why the postal savings bank can be carried on at a small additional cost, and why it is possible to incorporate at a very inconsiderable expense a parcels post in the rural delivery system. A general parcels post will involve a much greater outlay.

It would seem that the N. A. R. D., in its efforts to prevent Congress from establishing any sort of a parcels post, must now reckon with strong opposi-

tion from the White House. Both the president and the Post-office Department are in favor of a parcels post on the rural delivery routes.

* * *

**THE PRESIDENT
ON THE
HEALTH BUREAU.**

We may quote also what the president had to say concerning the much-discussed proposition to establish a bureau of health in Washington:

In my message of last year I recommended the creation of a bureau of health, in which should be embraced all those government agencies outside of the war and navy departments which are now directed toward the preservation of public health or exercise functions germane to that subject. I renew this recommendation. I greatly regret that the agitation in favor of this bureau has aroused a counter-agitation against its creation, on the ground that the establishment of such a bureau is to be in the interest of a particular school of medicine. It seems to me that this assumption is wholly unwarranted, and that those responsible for the government can be trusted to secure in the personnel of the bureau the appointment of representatives of all recognized schools of medicine, and in the management of the bureau entire freedom from narrow prejudice in this regard.

It seems quite probable that in the present short session of Congress little attention will be paid to this matter, but that ultimately a bureau or department of health will be established can scarcely be doubted. The thing for pharmacists to do, as was made clear at the Pittsburg meeting of the N. A. R. D. last September, is not to fight the movement as a whole, but to see that the interests of pharmacy are safeguarded in the proposed bureau.

* * *

**PHARMACOPOEIAL
PUBLICITY.**

An address which Dr. H. W. Wiley delivered at a recent meeting of the Washington City Branch of the A. Ph. A. has attracted a good deal of attention. It was devoted to the subject of pharmacopœial revision, and we were especially interested in what the Doctor had to say on the subject of publicity:

In my opinion the work of revision of the Pharmacopœia will be greatly aided by a frank practice of publicity. Unless it be a matter wholly personal, as for instance a discussion of the capability and industry of those engaged in the active work of revision, there is practically no reason why all the acts of the Executive Committee of Revision and of the board of trustees should not be given wide publicity through medical and pharmaceutical journals and by means of public addresses and discussions. It seems certain that by such means many criticisms and suggestions of great practical utility would be secured. The pulse of each profession would be felt in this way and a closer and more cordial coöperation

of all interested parties secured. No kind of comment, favorable or unfavorable, need be feared, and many faults, of omission and commission, would be avoided. It is far better to have criticisms before the final publication of the text of the book than to wait until it is too late to profit by them. In so far as is compatible with the duties of the office, I shall use my best endeavors to secure judicious publicity relating to this great work.

As president of the pharmacopœial convention for the next ten years, and therefore in a position of authority, Dr. Wiley's utterance on the subject of publicity is of particular significance. There is no doubt in our minds that his position is eminently sound.

* * *

A PRESCRIPTION NO DEFENSE.

On several occasions during the last year we have pointed out in the BULLETIN that a prescription is of itself no defense in the sale of liquor or narcotics. The prescription must be written in good faith by the physician, and it must be dispensed in good faith by the druggist. Several cases where both physicians and druggists have been successfully prosecuted for writing and dispensing prescriptions illegitimately have been reported in our columns. Another case has now come to our attention.

In Washington county, Pa., a druggist and a physician were indicted for conspiring to evade the liquor law by conforming nominally to the requirement that liquor must be sold only on prescription. Judge McIlwaine of the county court charged the jury that it must distinguish between a prescription honestly given by the physician and a prescription written for a fee with the knowledge that the liquor was to be used as an out-and-out beverage. In the one case, said the Judge, the prescription was really such; in the other case it was a mere order such as anybody might write. Furthermore, the druggist, filling such an order, knowing that it was not a legitimate prescription, and was not written by a physician who had the patient under his professional charge, was equally guilty with the physician.

There is little doubt that this is good law, and it is very important just at this time when the tendency is more and more to restrict the sale of narcotics, and also of liquors in dry sections, to physicians' prescriptions. In Michigan, however, the courts seem to have taken the opposite view and to have held that a physician cannot be touched even if he does a frank business in the promiscuous distribution of liquor prescriptions at 25 cents apiece—a

vicious condition of things indeed! Hence the movement of the Michigan Retail Druggists' Association, a new society in the western part of the State, to so amend the law that in dry counties an affidavit sworn to by the purchaser shall be substituted for the physician's prescription now demanded.

* * *

AT LAST!

The California State Board of Health is the first to place syphilis and gonorrhea on the list of reportable diseases. This action was taken in a regulation recently issued, which reads as follows:

Be it resolved, That the California State Board of Health declares that, beginning Jan. 1, 1911, syphilis and gonococcus infections shall be reportable and shall be placed on the list of communicable diseases which local boards of health and health officers are required to report to the secretary, it being provided, however, that until further action by this board, physicians may report the facts concerning these diseases by office numbers instead of names of patients.

Be it further resolved, That this board officially calls the attention of the citizens of California to the contagious and infectious nature of these diseases and requests their co-operation in combating them by every available means—educational, sanitary, medical, social, and moral.

The importance of this step can scarcely be overestimated. It is now known that these diseases are far more wide-spread, and much more disastrous in their consequences, than others which have been the subject of health board supervision for many years. The initial step has been taken by the California Board of Health, and doubtless other State boards will fall in line from time to time. This means much for the future health of the community.

* * *

NEW A. PH. A. OFFICERS.

The election of officers for the American Pharmaceutical Association, carried on as usual through the mails, was finished some time ago and resulted in the following selections for the year 1911-12:

President—John G. Godding, of Boston, Mass.

First Vice-President—Wilhelm Bodemann, of Chicago, Ill.

Second Vice-President—Chas. M. Ford, of Denver, Colo.

Third Vice-President—Ernest Berger, of Tampa, Fla.

Members of the Council—E. G. Eberle, of Dallas, Tex.; Jas. M. Good, of St. Louis, Mo.; Geo. F. Payne, of Atlanta, Ga.

The total number of votes cast was 1238, of

which however 225 were rejected in accordance with a resolution adopted at the last annual meeting that only the votes of those who had paid their annual dues for the year should be counted; 11 of the votes cast were unsigned and could therefore not be admitted.

These officers will be installed at the Boston meeting in August and will serve during the convention year of 1911-12.

* * *

VACCINE— KEEP IT COOL!

During the last few weeks, since the winter season approached, there have been smallpox scares here and there throughout the country with the result that very large quantities of vaccine virus have been employed. In many instances, as usual, complaints have been numerous that some of the commercial vaccines on the market have proved ineffective. Typical "takes" have frequently failed to result. The manufacturers of biological products, several of whom have conducted exhaustive investigations on this point from time to time, have more than once declared and proved, however, that in the great majority of instances the reason why vaccine virus is ineffective is because it has been improperly stored and kept by the druggist. The virus will not stand being overheated, and when kept in a warm place in the pharmacy very rapidly loses its virtue. It should be put in a refrigerator or at least in a cool basement. And it should be ordered in small quantities and often, so as to give assurance of being reasonably fresh. Of course it must be understood that in a considerable number of instances vaccine fails to produce vaccinia because the individual is already immune. Under such circumstances it is the height of injustice to blame the vaccine—the man himself is too healthy!

* * *

TIT FOR TAT.

The physicians are now retaliating. The anti-medical-dispensing crusade of the N. A. R. D. has brought a return fire in at least one section. It is reported in the newspapers that the physicians in the northern part of Hudson county in New Jersey have started a movement to stop counter-prescribing. We find a long editorial on the subject in one of the New York papers in which it is said among other things that "beyond all question the apothecary has always encroached very far upon

the professional field of the physician," and that the movement of the New Jersey physicians "ought to attract wide interest, for the evil that it seeks to uproot exists to a greater or less extent in every county in the United States." It seems that in the State of New Jersey there is a law making counter-prescribing punishable by a fine of \$100 or an imprisonment of six months, with double penalties for succeeding violations. The pharmacists, on the other hand, are fortified by no such laws with respect to medical dispensing, and it would seem as if the physicians had the best of it in any tit-for-tat encounter.

* * *

AFTER LARKIN ET AL.

And now the State pharmacy board in Iowa proposes to bring under the itinerant vender law all concerns like the Larkin Soap Co. which sell drugs and medicines on what is called the "club" plan. The Larkin people declare that they have a right under the interstate commerce law to distribute their wares without being considered venders, and we shall see what we shall see. In the meantime the Iowa board says it will stand by its guns and insist on the payment of the customary \$100 annual license fee.

* * *

Dr. Wiley, in his capacity as president of the pharmacopœial convention, has expressed his opinion that the ninth revision of the Pharmacopœia may be brought out in May of next year. But Dr. Wiley is new to pharmacopœial work, and he may be reckoning without his host. Then, too, the announcement of the Doctor's forthcoming marriage has just been made.

* * *

Despite the fact that the prices of certain medicated plasters have advanced, owing to the increased cost of rubber, some druggists are still maintaining the old retail prices, and are thus really sacrificing their profits. The Philadelphia association is striving to correct this condition of things in its own city.

* * *

Well! well! A druggist down in Ohio, who is incidentally vice-president of a bank, and who was for several years affiliated with a university, is now being prosecuted for selling liquor illegally to some of the students of the university.

EDITORIAL.

THE BULLETIN FOR 1911.

It has been customary for us to have a heart-to-heart talk with our readers at the beginning of every year—to tell them something of our plans for the ensuing twelve months and to invite their coöperation. The time for this chat has rolled around again, and we should like to say something to our subscribers about what we propose to do and also to tell them what, if they feel willing, we should like to have them do. The BULLETIN has always had a great satisfaction in the friendly relations existing between itself and its readers, and most of the success and popularity of the journal we are frank enough to attribute to their assistance.

The BULLETIN has invariably been looked upon as something "different" from the other journals. It is the one periodical in the drug trade which is opened every month with the feeling that it will

PLANS FOR THE YEAR.

contain something novel—something unexpected—something fresh and timely—something that will not be found elsewhere. In a word, it piques interest. Striving to live up to this reputation, we fully expect that during 1911 the BULLETIN will be a livelier, more readable, more helpful, more indispensable publication than ever. It will contain new illustrated features of great interest. It will shortly carry on a new prize contest of a helpful character. It will develop two or three new departments of an exceedingly practical nature. We are now busily engaged in making plans for the new year; we are sending out over 200 letters in search of the most interesting and useful material that we can find; and we give the assurance that during 1911 the BULLETIN will strike a new clip. Watch us!

In the meantime we shall continue and amplify most of the things which have made the journal so popular—the original articles on business subjects, the papers on dispensing pharmacy by practical men, the Dollar Ideas, illustrated window displays, answers to board-of-pharmacy questions, "Best Advertising Schemes," "Exciting Experiences," full-page cartoons of leaders in the trade, descriptions of successful stores, portraits and sketches of prominent men, drug-store fiction and poetry, a snappy digest of news of the month, and interesting and practical material of a hundred and one kinds.

These, we repeat, are some of the things we expect to do—just a few of our plans. Now we

CRITICIZE US!

should like to hear from our readers about the BULLETIN. We don't mean that we want them to write complimentary letters: we get hundreds of these during the course of the year, and we are always proud and happy to receive them. But what we are asking for now are letters of criticism instead of praise. We should like to have you write us frank answers to the following list of questions:

1. What features or department of the BULLETIN do you like best?

2. What things in the BULLETIN do you like the least, and what, if anything, would you be willing to have us throw overboard?

3. What would you like to have us print in the journal that we do not already have—what new things would you suggest?

If our readers will be kind enough to express themselves along these lines we shall be better able to hit off their tastes—to know what they really want—to turn out the kind of a journal they most like. And of course this is exactly the kind of a journal we are anxious to make—we are publishing it to suit our readers, not ourselves, and our greatest desire is to make a touchdown behind this goal.

Another thing: We have already confessed frankly that the class of material which has largely helped to make the journal so popular is that which comes to us from our subscribers themselves.

WHAT WE WANT.

We are proud of the coöperation which we have had from them, and we earnestly solicit its continuance. During the last year or so, however, we have received so much material of certain kinds that we have been compelled to return all new contributions, and we have been afraid that our readers would assume that we were changing our policy and that we no longer cared to hear from them. We have had, for instance, so many illiterate customers' orders, so many dollar ideas, and until recently so many window displays, that we could accept nothing further for the time being in these three directions. This congestion has *not* been true with respect to certain other classes of material, and we now invite contributions along the following lines:

1. Specimen advertisements for reproduction and comment in the department of "Business Hints."

2. Practical and timely communications for our department of "Letters." For this purpose sales ideas, new formulas, and current comment are especially invited. The department of "Letters" last month, for instance, well illustrated the possibilities, and it suggested our ideal for this department—a place where "our readers may exchange opinions and practical suggestions with one another for their mutual interest."

3. In this issue we are using up all of our material for the department of "Best Advertising Schemes," and we invite further contributions. Accepted articles are paid for at the uniform rate of \$2.50 each.

4. We should like to receive portraits and short personal sketches of the officers of drug-clerk associations, with some information as to what these societies are endeavoring to accomplish.

5. We announce herewith a new prize department to be known as "Best Soda Formulas." We solicit original and successful recipes for competition, and we shall pay \$10 for the best formula and \$5 each

**A NEW
PRIZE OFFER.**

for the two next best. A committee of three soda experts will pass on all contributions. The awards will be announced probably in March and the prize-winning formulas will be published either in March or in April. Let us hear from all the soda enthusiasts—the more the merrier.

We have a good many other things that we should like to say—much more that we should like to talk over with our readers at the beginning of this New Year, but we do not want to weary you with shop talk. Perhaps we shall return to the subject a month or two hence. In the meantime we want to assure you again that our great purpose is to turn out such a journal as *you* want—to solicit your constant coöperation—and to cement still further the friendly relations which have always existed between you and ourselves. In the meantime we thank you most heartily for your attitude in the past, and we wish every one of you a happy and a prosperous year throughout 1911!

"606" FOR DOCTORS ONLY.

The discovery of Ehrlich's new remedy for syphilis had hardly been announced when the medical charlatans in New York City began advertising "Treatment with 606." Of all the brazen-faced quackery, this was the worst. "Salvarsan" was

not yet on the market. Aside from a meager supply of the drug furnished by the Rockefeller Institute for experimental purposes only, the product was not available. In fact, it was announced months ago that Ehrlich's "606" would not be sold to the trade until January 1, 1911.

But why concern ourselves with these fake healers, these venereal pseudo-specialists? Because the administration of Ehrlich's remedy calls for a good order of medical intelligence. Only a skilled physician should be permitted to give it. So involved is the technique that there is already talk of establishing specialists who have mastered the process just as we now have men known to be expert in certain genito-urinary operations. In the hands of an amateur the treatment is fraught with danger.

Ehrlich has already announced that the drug must not be given to patients suffering from any diseases of the eye, heart, or kidney. After the injection, he advises that the patient remain in bed, where he can be carefully watched for possible untoward results. For he gives it as his opinion that no agent will ever be found which is powerful enough to destroy the syphilis spirilla without involving at least a chance of hurting the tissues. Swelling at the point of injection, systemic disturbances such as malaise and fever, are some of the things that commonly follow an injection of "606." Apparently the drug is no play-thing.

Furthermore, if the doctor in a desire to be on the safe side gives too small a dose, the results are again serious. That nullifies the whole treatment. The syphilis organisms are then exposed to just enough arsenic to develop their tolerance for the drug without effecting their destruction. Just as the Alpine arsenic eaters by repeated doses of the poison are able to withstand quantities that would kill an ordinary individual, so the syphilis spirilla by contact with weak arsenical solutions come to endure as much of the metal as the tissues themselves. An interesting situation!

One must therefore give the spirochætæ a knock-out dose at the start. This calls for the service of a trained medical man. It is no place for quackery. Already we hear of some relapses in the Ehrlich treatment due, for aught we know, to an insufficient dosage. It is very evident that the use of Ehrlich's remedy must be restricted to trained practitioners.

In all likelihood the "treatment with 606" adver-

tised by the medical quack was nothing more or less than the regular mercurial régime. When the blemishes disappeared, the victims whose bodies had been supposedly sterilized by "606" were free to resume their former habits. Lulled into a false sense of security by a disappearance of the symptoms, but with the germs still lurking in their systems, they might go forth to infect no one knows how many more with the loathsome disease! Meanwhile the charlatan had his dollars. Such cupidity it would be hard to find outside the realm of medical quackery.

TO OUTWIT THE MAIL-ORDER HOUSES.

A big manufacturer of revolvers has worked out a plan to get the best of the mail-order catalogue houses. We refer to the Iver Johnson's Arms & Cycle Works of Fitchburg, Mass. These people say that the manufacturers in the several lines of trade have it in their power to pull the fangs of the mail-order concerns, and this is how they propose to apply the remedy:

In a word, the goods of the house will not be sold direct to such companies, and a scheme has been devised to prevent the companies from getting the goods indirectly. The jobber is placed on a rebate basis very similar to that evolved some years ago by the manufacturers of Cascarets. He pays the long retail price for the goods and he only gets his commission or discount some weeks or months later when he is able to prove that he has furnished no supplies to the mail-order concerns. The retail dealer is likewise prohibited from giving aid and comfort to the enemy or from cutting prices. Both the jobber and the retailer are made licensed agents for the manufacturers, and their contract holds good only so long as the terms of the license are faithfully observed.

More than this, however, the manufacturers propose going direct to the public and explaining the situation in a systematic series of advertisements in the popular journals. The people will be told that the Iver Johnson revolvers will only be sold by licensed dealers; that mail-order houses will not be given licenses; that this system has been found necessary in order "to prevent the substitution of obsolete models, insure the proper treatment of customers, and confine the sale of our revolvers to proper persons." By this plan in all its details the

manufacturers hope to accomplish two things: They expect, in the first place, to earn the support of the rank and file of retailers, because they eliminate both price-cutting and the competition of mail-order houses. In the second place they expect to retain and increase the public demand for their goods by fair treatment and by well-planned advertising campaigns carried on in the popular magazines and papers.

BEATING CONFECTIONERS AT THEIR OWN GAME!

The several articles contributed to the October BULLETIN on the subject of candy, and written for us by successful druggists, were abstracted and commented upon in a recent issue of *The Confectioner and Baker*. Incidentally the journal expressed itself regarding the symposium in a manner which will prove of general interest to our readers:

In reading a symposium on the sale of confections as a side-line by druggists, published in the October number of the BULLETIN OF PHARMACY, of Detroit, much of our wonder ceases as to why some confectionery stores do not thrive in some cities and towns. *They are outdistanced by the finer confections kept in stock and the scrupulously neater arrangement observed by the druggists.* Confectioners naturally lose business whenever they get careless and fail to keep an attractive and up-to-date store, while the druggist, looking at any special side-line as a good winner, seeks to present the freshest and neatest looking line of package goods he can get. There is no excuse for the great difference in the looks and the quality of goods in the two places. But perhaps a reason may be found where one is a careful reader of his trade paper and the other never reads any paper devoted to his interests. The confectioner who keeps abreast of the times is invariably a reader of his trade paper.

Two things will be apparent after reading the foregoing comment: First, it will be seen why some druggists have outdistanced the confectioners themselves in the sale of fine candies, and secondly it will be realized by druggists what they must do if they want to keep ahead in the race.

THE CITY OR THE COUNTRY: WHICH AFFORDS THE BEST OPPORTUNITIES?

J. P. R., of Chicago, writes us the following letter: "Would you kindly inform me through the BULLETIN OF PHARMACY which do you think is the better-paying drug store, the city or country one?"

Give reasons for selecting one or the other, and also the advantages and disadvantages of both. What would be the value of a store doing an average of about \$18 or \$20 per day business, in city and country, and what population would you suggest the country town to have?"

A general letter of this kind is a pretty hard thing to answer without knowing anything of the man himself, his tastes, his abilities, or his capital. In general it might be said that the city affords the best opportunity for the man of brains and ambition, and particularly if he have sufficient capital. Of course it needs a good deal more money to equip a city store properly than would be necessary in a country town. More than this, the profits are smaller and a larger volume of business has to be done. On the other hand, we venture the assertion that the average country druggist is better off financially than his city brother. He hasn't so much money tied up in his store; he doesn't have cut prices to contend with; his expenses are much less; he makes better profits; and his hours of labor are shorter. On a given basis of \$18 or \$20 a day, such as our correspondent mentions, the country town would certainly yield a better profit than the city, and if the proposition is limited to a store of this character, we should be inclined to say that the country is a better place for our friend to start in business.

Do our readers agree with us?

A store of this kind in the country ought to be purchased, we should say, for two or three thousand dollars. In the city it would doubtless cost a little more.

REFILLING NARCOTIC PRESCRIPTIONS.

At the Pittsburg convention of the N. A. R. D. it was suggested by E. F. Heffner, secretary of the Pennsylvania State Association, that a resolution be adopted calling upon the members of the N. A. R. D. to refrain from refilling prescriptions calling for narcotics. Mr. Heffner declared that some time ago the Associated Press had sent broadcast to the newspapers all over the country certain statements regarding a paper of his read before the Pennsylvania Association and discussing the subject of curing the drug habit; that this had caused a number of habitués to write to him for relief; and that many of them in telling how they came to be addicted to the use of narcotics attributed the habit to the fact that

they had had prescriptions frequently refilled which were originally ordered for them by their family physicians.

Mr. Heffner's resolution, however, had hard sledding at Pittsburg. It was discussed quite animatedly one evening at the open meeting of the Committee on Resolutions, but two or three speakers declared that the mere adoption of such a resolution would be tantamount to a confession that it was the custom of the druggist to refill such prescriptions. Rather inconsistently, though, the same men argued that the evil should be corrected by the physicians themselves—that they had power to prevent the refilling of prescriptions by giving directions to this effect to the druggist. The Heffner resolution was finally defeated for this nominal reason—that it was up to the physician to forbid the refilling of prescriptions whenever he deemed such action necessary.

We must confess that we were rather disappointed at the outcome. We know that many druggists already refuse absolutely to repeat narcotic prescriptions, and we believe that humanity would be greatly bettered if this practice were universal among the drug trade. If the N. A. R. D. were to take a definite stand of this kind it would be of great moral value.

SOAP AND THE DRUGGIST.

A convincing illustration of the valuable co-operation which the BULLETIN gets from its readers is seen in the symposium on Soap elsewhere in the present issue. It would be difficult to imagine more helpful and interesting material than this—from the standpoint of the druggist who wants to make a business success and is looking for all the light he can get. Five men have written of their experience behind the soap counter, and they do it with a frankness which suggests a number of congenial druggists sitting down together and exchanging opinions and ideas with one another for their mutual advantage. We should be glad to hear from others who may have additional notions to advance about soaps. "About soaps," did we say? Well, write us about any side-line or feature of your business that you have been particularly successful in exploiting. It is from the man behind the counter, from the man who has himself turned the trick, that we always like to hear.

THE HALL OF FAME.

DRUGGISTS IN POLITICS.

Last month we had considerable pleasure in printing eighteen portraits of druggists here and there throughout the country who had been chosen to fill public office of one kind and another at the November elections. On another page in this issue of the BULLETIN we are showing nine other men in the drug trade who were similarly successful in gaining the public trust. Two additional likenesses of political pharmacists are reproduced in this place. The first portrait is that of Chas. N. Clarke, of Hood River, Oregon, who was elected County Judge on the republican ticket. To have some one other than a lawyer chosen to fill a judicial position is indeed a compliment to the man selected.

The second portrait is that of Frank H. Caldwell—another Oregonian. Mr. Caldwell hails from Newberg, is a democrat, and was elected a member of the State Senate to serve his third consecutive

CHAS. N. CLARKE.

FRANK H. CALDWELL.

term in that position. He was originally made a member of the House of Representatives back in 1904, was elevated to the Senate in 1906, and re-elected to the latter position in 1908 and 1910. Incidentally Mr. Caldwell is also a member of the

Oregon Board of Pharmacy. It must be very gratifying to the druggists of Oregon to have a man of this type in the State legislature to see that their interests are properly conserved and promoted.

THE LATE LOUIS DOHME.

Louis Dohme, president of Sharp & Dohme, manufacturing chemists of Baltimore, died on December 12 from neuritis, following an illness of several months. Mr. Dohme was born in Germany in 1837 and was brought to this country when 15 years old by his parents. Entering the retail drug store of A. P. Sharp as an employee, the firm of Sharp & Dohme was established a few years later, and thereupon, chiefly through the aggressiveness

LOUIS DOHME.

of Mr. Dohme, the manufacture of pharmaceuticals was begun on a small scale. Charles E. Dohme, a brother, was taken into partnership in 1866, and from that period on the enterprise grew rapidly until finally the present large establishment was the result. Mr. Dohme was graduated in 1856 from the Maryland College of Pharmacy and was president of this institution for a considerable number of years. A bachelor, he lived with his brother, Charles E. Dohme, at the latter's handsome residence in Baltimore, and he was a prominent member of organizations like the Germania Club and the Baltimore Country Club. Of late years he had withdrawn more or less from active business, had taken frequent trips abroad, and had gratified his love of art and music.

A HIGH-SALARIED MAN.

At the last annual meeting of the United Drug Co. in Boston, some reference to which was made in the BULLETIN at the time, President Louis K. Liggett explained to his stockholders all the ins and outs of the Riker-Liggett litigation during the past year, and went also into the history of the Riker-Hegeman combination which was originally expected to involve the thirty or more stores owned by the Louis K. Liggett Co. Desiring to have the members of the United Drug Co. know the facts about everything which had transpired since the last meeting, Mr. Liggett expressed his willingness to answer questions that might be put to him and incidentally declared that only a few days previous

LOUIS K. LIGGETT.

a stockholder had written and asked him what his salary was as president of the company.

He thereupon explained that his present salary was \$10,000, at which a stockholder on the floor called out, "That is not enough"—a statement which caused everybody to burst into laughter and applause. Mr. Liggett said that when the company was first organized the salary of the president was \$4000, afterwards it was raised to \$6000, and finally it was increased to \$10,000 as the business developed.

It is well known that Mr. Liggett is either the president or leading spirit of a number of auxiliary corporations, and in just how many of these he receives additional salaries we are not in a position to state. Neither do we know what his earnings are from the Louis K. Liggett group of stores. That he is, however, an able man, and that he is worth all he gets, is evidently believed by the stock-

holders of those companies which he has organized and conducted successfully. These are certainly large days in the drug trade if the opportunities are grasped.

TWO RETIRING MEMBERS OF THE EXECUTIVE COMMITTEE OF THE N. A. R. D.

For two or three years prior to the Pittsburg convention of the N. A. R. D., and possibly for a

W. S. ELKIN, JR.

period even longer than that, W. S. Elkin, Jr., and Edward Williams were members of the National Executive Committee. They were both excellent

EDWARD WILLIAMS.

men in that position—sane, conservative, and absolutely loyal to the interests of the organization. At the Pittsburg convention, however, both men announced that it would be utterly impossible for them

to go back on the committee, Mr. Elkin because of increased business cares, and Mr. Williams because he had been made secretary of the Wisconsin Board of Pharmacy and had certain other irons in the fire which consumed much of his time and energy. There was a disposition at Pittsburg not to let these two good men go, but their wishes were finally respected. Chairman Charles F. Mann, of Detroit, also felt that he had done his whole duty after six or seven years of steady work in official harness, but the Nominating Committee and the convention refused to let him off.

A SUCCESSFUL MISSOURIAN.

We are incorporating in this paragraph the portrait of W. C. Bender of St. Joseph, Mo., who is president this year of the Missouri Pharmaceutical Association. Mr. Bender is also president of the Retail Druggists' Association of St. Joseph, his home town, and in the third place he is a member of the State Board of Pharmacy. Evidently the druggists of Missouri think well of Mr. Bender! He was born in St. Joseph in 1872 and has been in business for himself fourteen years. He conducts

W. C. BENDER.

an ethical pharmacy, and we have before us as we write a public announcement in which he prints the statement that he neither makes nor recommends any patent medicine, but advises his patrons to consult a regular physician. Mr. Bender's particular desire is to build up a successful prescription business and he has evidently made good at it. Incidentally it may be said that he is a member both of the A. Ph. A. and the N. A. R. D.

THE NEW PRESIDENT OF THE JOBBERS.

The election of Dr. William Jay Schieffelin as president of the National Wholesale Druggists' Association, at the Dallas meeting in November, was a worthy tribute to one of the finest characters in the American drug trade. A product of both American and foreign universities, Dr. Schieffelin is a man of broad educational attainments, and he is not only a conspicuous figure in the drug trade

WM. JAY SCHIEFFELIN.

and in chemical circles, but has taken an active and leading part in various civic, philanthropic and religious movements. He is a citizen in a broad sense of the term. A man of polish, culture, wealth, social standing and practical ability, he will preside over the N. W. D. A. during the coming year with a good deal of force and dignity. It will be recalled that he was elected a member of the U. S. P. Board of Trustees at the pharmacopoeial convention in Washington last May.

Two of the largest department stores in Philadelphia have announced that they will give patrons the privilege of calling them on the telephone without cost. This means, when the slot 'phone of the druggist is used, that the charge is made by the telephone company to the department store instead of the customer making the call, and the druggist therefore loses his commission on the business. Fearing that this free movement may spread, the P. A. R. D. is striving hard to put a prompt check to it.

Carl W. Brenner, Stillwater, Minn., elected mayor of the city.

Lawrence J. Dugan, Webster, Mass., representative in the State Legislature.

Stanley J. Kuslewski, Chicago, Democrat, one of the commissioners of Cook County.

V. C. Armes, mayor of Gowanda, N. Y.

John E. Andrus, Yonkers, N. Y., re-elected to the National House of Representatives.

Dr. H. A. Weymouth, Saco, Maine, representative in the State Legislature.

Thomas W. White, Newton Upper Falls, Mass., representative in the State Legislature.

E. H. Dort, Auburn, Neb., Republican member of the State Legislature.

Wm. Forrester Town, member of the City Council of Mansfield, La.

Druggists Elected to Public Office.

The Atlas of Pharmacy—Dr. Henry H. Rusby, of New York City.

THE PHARMACY AND THERAPEUTICS OF "606."

Ehrlich's New Remedy for Syphilis—How to Dispense It—Precautions to be Observed—The Marvelous Curative Properties of the Drug—By a Pharmacist Who Has Repeatedly Prepared the Mixtures for Physicians.

By H. A. B. DUNNING.

As is generally known the title "606" was given to the substance under discussion because it was the six-hundred-and-sixth preparation experimented with by Ehrlich and his associates in their attempt to discover a specific for certain parasitic organisms, which would be relatively non-toxic to the human system.

This particular substance was prepared by Bertheim in conformity with the theories of Ehrlich. It was first used by Hata, Ehrlich's associate, in his

early reports entirely confirmed the conclusion drawn from Hata's experiments on animals.

GATHERING CLINICAL DATA.

For the purpose of obtaining data of the most comprehensive character and to guard against the misuse of the substance, Ehrlich formulated a plan of investigative experimentation such as has never been known. A limited supply of the material was furnished many medical institutions and in some instances individual expert investigators, throughout the world, the only stipulation being that the experiments should be carried out along the lines suggested by Ehrlich and that typical cases should be selected for treatment. No charge was made for the drug, but it was stipulated that the results should be reported to Ehrlich.

Thousands of doses have been furnished without charge and some eight thousand have been reported upon by medical men from all parts of the world, naturally the larger number coming from Germany. As a specific for syphilis, the status of the new discovery is still in doubt. Early reports told of marvelous cures of nearly all types of syphilis, without any untoward results. These were followed with somewhat conflicting stories until at the present time the most that can be stated is that after an injection of "606" with suitable dosage and under proper conditions, in the large majority of cases, the organism disappears from the serum of lesions within 24 to 48 hours. The Wassermann reaction for the presence of syphilitic toxins in the blood becomes at least temporarily negative. Lesions are in nearly all cases greatly improved in a few days and are entirely eradicated within a few weeks.

Fatal results have been few and in most cases seem not to have been due to "606" directly. The most important question as regards the efficacy of "606" as a permanent cure for syphilis is the matter of recurrence. Although spirochætæ disappear,

H. A. B. DUNNING.

experiments on animals infected with the spirillum of recurring fever, while others tried it upon the organism of syphilis. These experiments tended to show that a single dose of "606" destroyed within the body of the rabbit all spirochætæ, the parasite of syphilis, within one or two days and promoted the rapid healing and final disappearance of open sores within a few weeks.

At Ehrlich's request a number of eminent medical investigators made tests of the new remedy on human subjects and reported the results. These

lesions heal, and the Wassermann test becomes negative, some of the best men report recurrence within a few weeks or months.

Whether recurrence will be so limited that the general value of the remedy will not be greatly lessened, or there will be some new method of use discovered which will prevent it, only the future can determine. There seems to be a general consensus of opinion that the remedy will be of tremendous value in the cure of syphilis either in all types or at least in some, particularly in conjunction with the use of mercury.

SOME PERSONAL OBSERVATIONS.

Personally I have seen eight cases treated with this remedy, having prepared the material for injection. In only one case was there any local disturbance of any importance at the seat of injection. And none of the patients showed alarming symptoms. In each case organisms disappeared within a few days, lesions either entirely healed or cleared up greatly within ten days to two weeks, the Wassermann reaction becoming negative.

In a few words the effects produced by injecting these eight doses of "606," by the suspension method, which I will describe further on, have been marvelous. The cases will of course be reported in full by the several medical men for whom I prepared the material for injection.

THE CHEMISTRY OF THE DRUG.

In regard to the chemistry of "606," it is an organic arsenic compound containing about 40 per cent of arsenic. Its full chemical name is *1 arseno, 3 diamino, 4 dihydroxy benzene*. The more common chemical title is dioxydiaminoarsenobenzol. Written graphically the chemical formula is:

Or it may be written:

As will be noted the compound contains two phenol groups which impart to it a weak acid character, while the arseno-amino groups give to it weak basic properties. It may act either as a base, combining with acids to form salts, or as an acid, combining with alkali to form salts.

Inasmuch as dioxydiaminoarsenobenzol is an un-

stable compound, the preparation is marketed as the "bichloride,"

in sealed glass tubes. This salt, however, is not suitable for injection on account of the fact that in contact with water it quickly hydrolyzes, thereby liberating hydrochloric acid, which would cause the injection to be exceedingly painful. Because of this fact either the sodium salt,

is injected or the base, the formula given above.

It might be noted here that the injection of the sodium salt is also painful, for like the "bichloride" the combination is so weak that hydrolyzation occurs in presence of water and NaOH is liberated.

The quantitative reactions involved in preparation of "606" for injection as base are:

438 Gm. "606" require 160 Gm. NaOH to form bisodium salt.
0.1 (one decigram) requires 0.0368 NaOH to form bisodium salt.

0.6 (average dose) requires 0.2208 NaOH to form bisodium salt.

0.6 ("606") yields 0.156 NaCl when bisodium salt is formed.

0.6 ("606") requires only .108 NaOH to neutralize HCl and liberate base.

0.108 NaOH is equivalent of 2.8 N/1 NaOH or .7 4/N NaOH.

0.1 "606" forms .093 bisodium salt.

0.6 "606" requires of glacial acetic acid .162 to liberate base from bisodium salt.

0.222 sodium acetate.

0.7404 sodium acetate will be administered if .6 "606" be dissolved in 3 Cc. 15 p. c. NaOH solution (this is amount suggested by Ehrlich).

One of the most confusing circumstances regarding "606" has been the numerous methods and change of methods for preparing the material for injection. According to many of those who have experimented with "606," particularly in America, among the most important considerations is the careful technique required. Here is where the pharmacists come in, and is the *raison d'être* for this article. From an article by Henry S. Elsner, M.D., Professor of Medicine, Syracuse University, in Dec. 10, 1910, *American Medical Journal*, the following passages are quoted:

"One would naturally suppose that it is easy to prepare the remedy for either intramuscular or intravenous injection. I myself shared this opinion with others who had never seen it used. Before Ehrlich sent me the remedy, after I wrote him I was soon to leave Germany, he wisely suggested that because of the great difficulties of preparation, those who were to use it might with profit visit some one of the leading centers of Germany where there was a large amount of clinical material for the purpose of learning the method of its mixture, and the injection technique."

Also a column further on in the same article:

"I must repeat the warning of Ehrlich, unless the method of preparation of the remedy is to be materially simplified in the future no one should undertake its introduction into the body without first seeing the experienced mix and use it. I have seen Wechselmann's assistant work almost an hour before his mixture was neutral."

It is not necessary to discuss the great variety of methods suggested and used by various investigators, for although not wishing to be overcritical, some of them are without doubt startlingly crude.

As was previously stated the substance may not be injected as the "bichloride" in watery solutions or mixtures.

PREPARING THE INJECTION.

At the present time there are three distinct methods and many variations of these for preparing the material for injection.

The essential features of the Alt method or alkaline solution method is as follows: The "bichloride" is partly dissolved in five or ten Cc. of water and N/1 NaOH solution is added until the precipitate first formed is just or not quite brought into solution; this is then diluted to 15 or 20 Cc.

The intravenous method is given in Elsner's article as follows:

"Into a graduate holding 250 Cc. drop 10-20 Cc. of sterilized water. Add the required dose of "606" and mix thoroughly until there is a clear solution; add sterile water, or better, normal salt solution, to the 100 Cc. mark; then add pro 0.1 of "606" 0.7 of normal sodium hydroxide and mix thoroughly until the precipitate is thoroughly redissolved. If after thorough mixture the solution is not clear add a few drops of the sodium hydroxide solution to produce this, and then add sufficient normal salt solution to make 200-250 Cc. The fluids used are all to be warmed. The alkaline mixture is then ready for injection."

The neutral suspension method consists in dissolving the "606" in a strong solution of sodium hydroxide, reprecipitated with glacial acetic acid, rubbing precipitate until finely divided, diluting with water, and finally neutralizing with weak acid or alkali, whichever is required. It is this method which I will describe in full further on.

The alkaline solution method is only less painful than injection of aqueous solution of the "bichloride." While the neutral suspension method is the most satisfactory in regard to any by-effects, there are frequently, usually on account of bad technique, I believe, serious local disturbances.

While the intravenous method seems to be the most rational on account of the intention of overwhelming all the spirochætae immediately, and that, with proper technique, there are no local disturbances, the by-effects are more serious.

In regard to the best method of the three noted, I will but state that I leave that entirely to the judgment of the individual physician.

PREPARING THE NEUTRAL SUSPENSION.

The following method for preparing the neutral suspension is a modification of that suggested by Ehrlich and is given in the most minute detail, which I feel certain will call forth appreciation from the pharmacist who is required to prepare a dose of "606," although he may consider the directions somewhat long and tiresome:

Select a one-ounce porcelain evaporating dish with sloping sides, and also the bottom of a one-ounce tin ointment box in which the dish will rest to prevent tipping.

Prepare a glass pestle $2\frac{1}{2}$ inches long and $\frac{1}{2}$ inch in diameter by marking with a file a glass rod and breaking off a piece of the dimensions cited; roughen the rounded end of rod by means of file. Fill four glass stop-cock burettes with the following solutions: four normal sodium hydroxide, glacial acetic acid, decinormal solution sodium hydroxide, decinormal solution acetic acid; the latter two solutions and the burettes should be sterilized. A dozen or more pieces of blue litmus should be sensitized by passing gaseous ammonia through bottle or test tube containing them.

The same quantity of red litmus prepared by holding opened bottle of concentrated hydrochloric acid near mouth of tube containing the litmus paper.

A four-ounce Erlenmeyer flask is filled with distilled water, stoppered with cotton and sterilized.

The porcelain dish, tin bottom, glass pestle, litmus paper, eye dropper or pipettes are wrapped in gauze

and placed in an Arnold sterilizer and sterilized for an hour or more.

It has been my practice to take the sterile material and apparatus and prepare the dose at the time when and place where injected, otherwise a half or one-ounce glass-stoppered bottle must be included in the apparatus sterilized.

When ready to prepare the dose, the sealed tube containing "606" is marked with file with intention of making as large an opening as is wise, inasmuch as the powder is of such character that it is not readily shaken out of tube when the opening is small. The use of a sterilized platinum wire is very helpful.

The yellow soap-like powder is emptied into the sterilized porcelain dish containing the pestle, and the dish supported in the tin bottom is gently tapped to get all the powder down to the bottom.

I neglected to state that it is advisable to sterilize the hands by immersion in bichloride solution previous to handling the sterilized dish or pestle.

For each one decigram of powder 0.33 Cc. of four normal sodium hydroxide is let into dish from the burette. This mixture is stirred with a pestle until a perfect solution results. This operation should be accomplished without distributing the solution over any greater surface than is necessary.

To the solution is added for each one decigram of powder 0.05 Cc. (five hundredths Cc.) of glacial acetic acid.

NEUTRALIZING.

It is most important that the resulting mixture should be triturated until every particle is finely subdivided; it should require at least one-half hour to accomplish this; then enough sterile water is added to bring the bulk of mixture to 10 Cc., or 15 if desired. The mixture is now tested with the sterilized litmus by wetting (using pestle) a very small spot on a strip of the litmus paper with as little of the mixture as possible and examining the opposite side for color.

If the mixture is not neutral, it will be very near neutral. Then add enough of one or the other decinormal solutions to make the reaction neutral. While there is no statement to that effect in any of the literature concerning "606" which I have seen, the freshly precipitated base in aqueous mixture is without doubt amphoteric, and it is very important to remember this and observe particularly whether the finished mixture colors blue litmus faintly red rather than the action on red litmus. It is best that the mixture be slightly alkaline to red litmus and be

certain that it is not at all acid to blue. If the mixture is to be transferred to sterilized bottle then some of the sterile water used to dilute concentrated mixture should be reserved to wash the residue from porcelain dish into the bottle.

The mixture is now ready for injection. It will I believe be interesting and I hope instructive to note some of my experiments for the purpose of bringing the neutral base into solution.

A portion of a carefully neutralized suspension was collected on the filter, washed well and quickly by means of a filter pump, and then removed and rapidly dried on porous plate; the material was not soluble to any extent in petroleum oil, or olive oil, somewhat soluble in castor oil, more soluble in castor oil, alcohol and olive oil. The neutral base could not be shaken out with carbon tetrachloride, ether or chloroform. The intention to prepare a satisfactory oily solution was given up as impracticable. Some of the base collected and dried on porous plate made good suspension with paraffin oil. Fifty per cent glycerin suspension showed little sign of oxidation when kept in hermetically sealed tubes.

The bichloride is readily soluble in glycerin. The base precipitated from glycerin solution is in a very fine state of subdivision; only sufficient four normal sodium hydroxide being added to neutralize the hydrochloric acid of the "bichloride."

PREPARING THE ALKALINE SOLUTION.

The alkaline solution to be injected intramuscularly or subcutaneously is best prepared in this way: The following apparatus is carefully sterilized: several pieces of gauze of the size of a handkerchief and folded, absorbent cotton size of an orange, two glass rods, two 2-ounce beakers, one 4-ounce porcelain dish, one 1-ounce glass funnel, 25-Cc. glass stop-cock burette, preferably with upper half taken off for convenience in sterilizing. Also sterilized water, N/10 acetic or N/10 hydrochloric acid.

One of the beakers is wiped dry with sterile gauze. No part of the hands should touch the inside of the beaker even if they have previously been treated with "bichloride." Salvarsan, "606," is emptied into it, the beaker being gently tapped for the purpose of collecting powder in the bottom and on one side of beaker; 1.4 Cc. of 4/N NaOH is added and the mixture stirred. Avoid spreading, until perfect solution results; the beaker should be held over a sterilized porcelain dish while effecting solution. This solution is now diluted with 15 Cc.

sterile water and then enough sterile N/10 acid is added to produce slight opalescence. In my opinion, and this is my procedure, this solution should be filtered several times through a tight pledget of sterile cotton placed in a sterile funnel, until all specks and fibers are removed. The cotton is then washed with sterile water drop by drop to remove all solution of salvarsan. An extra beaker is among the apparatus sterilized for the purpose of receiving the filtrate. The solution after stirring is now ready for injection.

PREPARING SOLUTION FOR INTRAVENOUS INJECTION.

The preparation of the solution for the intravenous injection is somewhat similar to the method suggested for the alkaline solution. The sterile apparatus required is a one-pint florence flask, two 2-ounce beakers, a 4-ounce porcelain dish, a 1-ounce funnel, cotton, two glass rods, two burettes of 25-Cc., each provided with a glass stop-cock, sterilized N/10 HCl, N/10 NaOH, and physiological normal salt solution 400 Cc. repeatedly filtered; 0.6 salvarsan is emptied into a beaker, held over a porcelain dish; the powder is collected in the bottom of the beaker as in the alkaline solution method. 1.4 Cc. 4/N NaOH are now added and solution is effected as stated above; 30 Cc. of sterile filtered normal salt solution are added and the resulting solution is then filtered through a pledget of sterile cotton as before into the extra

beaker, the same care being used to remove extraneous matter and to wash the cotton. This perfectly clear solution is poured into sterile flask and the beaker well washed, the washings being poured into the flask. Enough sterile filtered normal salt is now added to make the volume measure 250 to 300 Cc. After mixing, sufficient N/10 HCl, sterilized, is added to produce incipient opalescence and then a drop or two of sterilized N/10 NaOH to clear away the opalescence.

The solution is now ready for injection, and in the best condition. 1.4 Cc. of 4/N NaOH are now added and the solution is effected as stated in the foregoing; 30 Cc. sterile normal salt are added and the solution is then filtered through a pledget of cotton as before, into a sterilized pint florence flask. It is then filtered back into beaker and again into flask until perfectly clear and free from extraneous matter.

At the present time the dose of "606" for adults ranges from 5 to 8 decigrams, while the toxic dose is more than 5 grammes.

The substance may be purchased from Victor Koechl & Co., of New York, about the first of the year, according to a letter received by me from that firm.

"606" will be marketed as Salvarsan. The price will be: 0.6-gramme tubes, \$2 net for wholesale and \$2.50 for retail druggists; and \$3.50 to physicians.

THE DRUGGIST AND THE FOOTPAD.

"Hist," cried the stealthy footpad, as he knocked the druggist down;

"Deliver up your wad at once, before I crack your crown!
You need not say you have no mon—I've watched an hour or more,

And fifty people passed within, and then came out your door!"

"Alas! sir," wailed the druggist, as he rose with features pale,

"I pray you, Mister Footpad, kindly listen to my tale:
Full well I know that people do go in and out my place,
But some come in for postage-stamps, and some come in to face

The mirror and adjust their hats, or borrow pen and ink,
And some come in to ask the time and some come in to think.
And some come in to meet their friends, and some their friends to bring

To ask me for an almanac, or else a piece of string.
And some come in to question where a certain car to catch,
While more come in to telephone or ask me for a match;
And some to look up something in the street directo-ree,

And some have nerve enough to try to borrow dough of me.
And some come in to sit an hour and hand out sage advice
On how to run a drug store and treat the people nice.

And some come in to rip me up and some to rip me down
Because I closed at twelve one night when they stayed late
in town.

And some come in to tell a joke that I have heard before,
And then because I don't 'ha-ha' they go away dead sore.
And some come in to change a bill and then go out again,
While some come in to warm themselves or get out of the rain.

And some——"

"Enough! Enough!" the robber said. "Yours is an awful calling,

My life of crime has never met a story so appalling.
Forgive that lump upon your head made by my club descending,

And take my purse—I feel condemned to think I came near ending

The life of one whose only work is every one befriending."

—*Rawlin's Drug News.*

FIVE DRUGGISTS DISCUSS SOAPS.

They Tell How They Buy Them, What They Carry, What Profit They Make, Which Goods Sell the Best, and How They Advertise and Push the Line.

Soaps of all kinds, toilet, medicinal and otherwise, comprise one of the most important side-lines in the drug store, and for several months we have desired to print some live, practical material on the subject in the BULLETIN. We finally addressed a list of questions to four pharmacists whom we knew had been unusually successful in developing this feature of their business, and their responses are full of "meat." Good buying and selling ideas stick out in nearly every paragraph. If other druggists feel prompted to give their experience with the soap line we should be glad to hear from them; this is a subject on which practically nothing has been printed in the drug journals, and we feel sure we have opened a helpful lead.—THE EDITORS.

By **HENRY D. HUGGAN**,
Boston, Mass.

I buy soaps in large quantities from the manufacturers when they make the price an object; and I

HENRY D. HUGGAN.

take especial interest in pushing brands that are of good quality, price-protected, and give a fair profit.

I carry in stock now several hundred dollars' worth of soaps, and average about 25 per cent profit on them. I think this is one of the best lines of goods in a drug store, for there is little, if any, loss from shrinkage or handling.

It is not always easy to distinguish between medicated and toilet soaps, for the pure and simple

Castile soap, for instance, is considered by many a highly medicated and beneficial skin soap. This soap is in large demand by our trade and earnestly recommended by our staff of assistants, therefore we carry a good line of imported and mottled Castile soaps. Perfumed toilet soaps, of course, are in greater demand than any other, while the strictly medicinal soaps are called for much in the same proportion as cough remedies and throat lozenges. Toilet soaps are used practically by every one, while medicated soaps are called for only when a physician prescribes them, or when necessity requires them.

BRANDS CARRIED.

The Colgate line of toilet soaps we take especial interest in, for its manufacturers are always alert to see that a square deal is given to the retailer. The Hudnut house is also favored by us, for they put out fine goods and regulate the prices as well. The Roger & Gallet line is also a good seller and gives satisfaction to the average purchaser. The above three lead in sales, but in addition we have quite a demand for Williams' Toilet Soap, Pears', 4711, Societe Hygienique, Piver's, Violette, Robinson's, Armour's and several others. Among the medicated soaps, we find that Stiefels' leads in sales.

We use all fair means within our power to increase our sales of soaps. We give a show-case ten feet long to the toilet soaps and another equally as large to the medicated soaps. In addition we display them in our windows frequently, and at times on the top of our show-cases. In this way we keep them always before our customers and think that we benefit very much by so doing.

MAILINGS OF SOAP CIRCULARS.

At different times of the year we put circulars into the packages that go out of our store, giving a list and prices of all our soaps. In this way the families are reached by our advertising matter and become acquainted with the different lines we carry. Situated as we are, we think that this is the most economical and effective way of keeping ourselves before the public and making known to them just what we have to offer.

As a last remark permit me to say that I believe the soaps that are destined to become the most popular, best, fastest sellers, and the most profitable to handle, will be those that are pure, finely milled, delicately and beautifully perfumed, attractively and neatly wrapped and price-protected. Human nature, you know, is about the same everywhere, and these qualities appeal to everybody.

By **HENRY W. MERRITT**,
Plains, Pa.

It is with pleasure that we write, as requested, brief answers to the questions that have been propounded by your enterprising editor regarding soap. We have been much interested in this subject. Determined to secure our just share of the soap business of this vicinity, we have kept up an earnest campaign and put not a little energy back of this department. Despite the very rapid growth of the soap clubs and the increased number of money orders sent to mail-order houses from this town, we have nearly quadrupled our soap business and multiplied our profits many times that amount during the past three years.

One of the most successful special sales that we ever held was one of soap. It was during this sale that we demonstrated the fact that it is not always necessary to cut the price down below cost to attract attention and make sales. We purchased a job lot of unwrapped glycerin soap, intending to place it on sale at 5 cents a cake.

PUTTING THE PRICE UP—NOT DOWN.

When the goods arrived we decided to try cutting the price up instead of down and accordingly marked it 7 cents or 4 cakes for a quarter. You should have seen the lot disappear. All was gone in less than a day, and for several weeks we had calls for that seven-cent soap.

Our soaps are purchased mostly from manufac-

turers and in sufficient quantities to secure the best possible prices. As members of the A. D. S. we make full use of our coöperative buying privileges.

We aim to keep a line of toilet and medicinal soaps complete enough to supply the demands of our community. We push only those on which we make a profit of not less than 100 per cent and make every reasonable effort to prevent a sale of an over-priced article.

Toilet soaps are the best sellers. The A. D. S. line gives me the best profit, netting nearly 140 per cent. This is also true of their medicated soaps. For example, their Vitaskin medicated soap costs us \$1.25 a dozen and we sell it at 25 cents a cake,

HENRY W. MERRITT.

making a profit of 140 per cent. On the A. D. S. line there is no soap club, department store nor mail-order competition. That it gives satisfaction to our customers is proven by our increased sales.

RESORT TO DISPLAYS AND MAILING LISTS.

We devote the base of one case to soap and occasionally use the top of the fixture and extra tables for special exhibits. We make a window display of soap about twice a year.

We have a mailing list which includes the names of nearly every housekeeper in this region, and we make use of this list for circularizing whenever we have anything special or new in our soap department. Regularly every spring we send out a letter calling attention to our line of soaps.

By **GRANT W. STEVENS,**

Detroit, Mich.

Soaps as a side-line have proven very satisfactory and profitable to me. I have featured them strongly in my present location, especially the cheaper and bargain grades.

Several window displays of a 10-cents-per-box

GRANT W. STEVENS.

soap has given me very gratifying results. I have bought from different manufacturers, but have had the best success with an assortment purchased from Kirk Co. at \$3.60 per gross in 5-gross lots. By making attractive window and counter displays I have disposed of $3\frac{1}{2}$ to 4 gross in one week and at a profit of $33\frac{1}{3}$ per cent.

The next best success I have had is with a mammoth transparent glycerin soap selling at 5 cents a cake or 20 cakes for \$1.00, with an occasional sale of 20 cakes. In displaying this soap, I place a flashlight on the floor of the window and pile the whole 5 gross over and around the flashlight. Hardly a person passes but who is attracted by this display, especially at night when the flashlight is working. This line also affords a profit of $33\frac{1}{3}$ per cent.

THE DISPLAY OF SOAPS.

I use a six-foot silent salesman show-case exclusively for the display of toilet and medicinal soaps. I never exhibit or offer any soap for less than 10 cents a cake except when I run these special sales.

For general purposes, I have been most successful with Colgate & Co.'s line ranging in price from 5 to

50 cents a cake. They need little or no introduction, and in taking advantage of their special offers their line affords a profit of from $33\frac{1}{3}$ to 70 per cent. And if one takes advantage of their extra special prices in large quantities, there is even 100 per cent or better in it.

My sales of the medicinal soaps have been somewhat limited, except of the brands which afford little or no profit. I have never used any method of advertising soap beyond window and counter displays.

By **JAMES F. FINNERAN,**

Boston, Mass.

We buy our soaps as far as possible from the manufacturers in quantities of five-gross lots, our purpose being to get the manufacturers' minimum price, which is usually based on that quantity. This, of course, does not apply to the slow-selling medicated and toilet soaps, which seem to be unlimited in number.

We carry at least three hundred kinds of soap, and we do find the line worth pushing. The profit

JAMES F. FINNERAN.

on them will average from 25 per cent upwards on the French soaps of moderate and high price, and at least 50 per cent on the lower grade of soaps retailing at 10 or 15 cents a cake.

While we carry quite a number of 5-cent soaps we keep them, as much as possible, in the background, believing that, in our store at least, it is much more

profitable to sell a 10-cent cake or three for 25 cents. And incidentally it takes no more time to talk up the 10-cent one than it does to sell the five. The percentage of profit is invariably larger, and, of course, the amount of profit is correspondingly larger.

The sale on strictly medicated soaps is limited, but the toilet soaps, in neat and attractive wrappers and boxes, have enormous sale.

VARIETY NECESSARY.

As for the brands, our customers are always looking for something new in toilet soaps, and we find it necessary to continually buy new brands of soaps in order to supply that demand.

We have a very large sale on domestic Castile (?) soap, which we buy in a 36-pound case of nine 4-pound bars, or the same soap cut into half cakes which we sell at 10 cents—three for a quarter. This soap we feature in the window, putting in the original rough case as received from the factory, showing the soap in green, white and mottled; both cut and in bars.

We have sold in ten days over a ton of this soap, and this has been duplicated two or three times during the year. It is needless to say that this soap must give satisfaction or we could not sell the quantity. It has a continual sale year in and year out even when not in the window.

ADVERTISING METHODS.

We make complete window displays of Castile soaps alone and also window displays of toilet soaps alone which greatly increase the sale at time of display. We also have one large show-case devoted to toilet soaps alone, and also have displayed in prominent places on our show-cases and counters always a variety of toilet and Castile soaps.

We very seldom advertise soaps in any way except by display because we believe it is necessary to get the customers' attention at the time of sale rather than to try to interest them through newspapers or circulars. I think it is safe to say that it is a waste of money, from our experience, for a druggist to use newspaper space in advertising soaps of any kind.

By JOHN C. WALLACE,

New Castle, Pa.

Domestic soaps that we sell in any quantity we buy direct from the manufacturers, imported soaps from their American representatives, and the soaps, both medicated and toilet, on which we have a limited sale we buy from the jobbers.

For a number of years we carried Stiefel's Medicated Soaps, but we are now giving more attention to Johnson & Johnson's line, which gives entire

JOHN C. WALLACE.

satisfaction. In addition to Stiefel's and the Johnson & Johnson lines we have in stock 41 different medicated soaps.

In toilet soaps we carry Pears', R. & G. Violet, Société Hygienique, together with a complete line of Colgate's. Soaps average about 50 per cent profit and are all worth pushing.

We sell about twice as many toilet as medicated soaps. We have not, however, made any special effort with the soap line beyond a good display in twelve feet of casing and an occasional window display.

“MY BEST ADVERTISING SCHEME.”

An Ingenious Method of Exploiting Cough Syrup: Goldfish as Premiums with Each Package—A Druggist in a Small Town Sells \$1200 Worth of Non-secret Remedies in Six Months.

ADVERTISING OUR OWN COUGH SYRUP.

By W. C. PETERS, NEW PHILADELPHIA, OHIO.

From an eastern firm we purchased the following in one lot: 1 gross 18-ounce fish globes, 1 gross packages of fish food, and 500 goldfish.

We dropped two small fish in each globe and set the entire lot in our windows, placing a 25-cent bottle of cough syrup back of each globe. A large window card in the center bore the announcement:

“Two goldfish and a globe *free* to every customer purchasing a bottle of our cough syrup, Saturday only.”

Wednesday, Thursday, and Friday we used our

W. C. PETERS.

daily paper, carrying a small advertisement as follows:

“144 fish globes, each containing two goldfish, given away next Saturday, at Peters’ Drug Store. See the fish in our window.”

The larger fish we put in a tub near the front of the store, placing a card on same as follows: “Large fish ten cents—catch ’em yourself.”

Then we were ready. When we opened our place of business Saturday morning about 15 customers were waiting, and from the opening hour up to 9.30 A.M. we disposed of about half, and by 9 P.M. we had disposed of the entire lot.

HOW THE SALE PAID.

Now for the best part of this stunt. To every customer we suggested that they ought to have one or two larger fish. As a result we sold about \$10 worth of them. We also suggested that they buy a package of fish food, with the result that we sold \$11 worth of fish food. In all we sold 144 bottles of cough syrup at 25 cents—\$36; fish, \$10; fish food, \$11; total, \$57.

Now listen. The fish, globes, and fish food cost \$18; advertising, \$1.50; express on fish, \$1.50; total, \$21.00, plus the cost of cough syrup, \$12.96, or \$33.96 altogether. Net profit, \$23.04.

In addition to this, we had left over almost three dozen packages of fish food and a number of fish. We have greatly increased the sale of the cough syrup besides creating a good steady demand for fish food, which is a profitable ten-cent package to sell.

This scheme might be improved on by offering one or two additional fish to those customers who purchase a 50-cent bottle of the cough syrup.

PUSHING MY OWN NON-SECRET REMEDIES.

By O. P. McPHERSON, GLOSTER, MISS.

We have a town of about three thousand people, a very good surrounding country, and three years ago I decided to put out a line of my own remedies. The list was to cover everything in the way of

..... 19
McPHERSON'S DRUG STORE:
MR
Agrees to purchase for CASH one or more bottles of McPherson's Remedies or have a prescription filled, the amount of which (\$.....) please place to my credit on your PIANO OFFER.
Name.....
Do you want to work for this Piano? Sell \$5.00 worth and get an Agency.

household medicines. I first wrote my own formulas and submitted them to several manufacturers, finally placing my order with a firm to the extent of \$1200 in the first invoice. The preparations had

quality but carried a good margin of profit, two important essentials in non-secret remedies.

When the goods arrived I went to work to get them before the people. Having invested \$1200 in the goods it was up to me to sell them. I first offered my clerks in addition to their regular salaries an extra 10 per cent for all cash sales of my remedies.

INTERESTING THE WOMEN.

Then I bought an upright \$300 piano to be given away on the sale of McPherson's Remedies. I secured a young lady in every neighborhood in this and the adjoining counties to work for the piano. I furnished each with a pad of order blanks for my own remedies. About 25 ladies volunteered at once. They went to work sending in orders.

Each lady's orders were kept on file, and at the close of each week I footed them up.

Each dollar's worth sold gave the agent one vote or chance on the piano. After my first agents were appointed, any one else desiring to enter the work was compelled to purchase \$5 worth of my remedies. Before the close of the contest I had nearly one hundred ladies at work.

The result was that I sold the \$1200 worth of goods in less than six months at a profit of more than 200 per cent, and in so doing I created a magnificent trade on the remedies. Any one can do the same thing. And I find it much better to sell products bearing a profit than to handle the goods that do not pay. To any one desiring further information I shall be glad to give particulars.

THE VALUE OF KNOWING PEOPLE'S NAMES.

By **ARTHUR IRWIN SMITH,**
Fulton, Kentucky.

It was a combination drug store and cafe. "What is it, Mr. Smith?" inquired the smiling young soda dispenser, as I stepped up to the fountain. I gave my order, wondering vaguely where I had seen the young man before. I had been in the town only a week, and although I had patronized the establishment frequently during that time, I knew I had not given my name.

"Thank you, Mr. Smith," said the cashier, politely, as I paid him across the cigar counter.

My curiosity was aroused, and I stopped for a short chat with him. I found that he was the junior partner and quite willing to talk of the firm's business methods when he learned I was in the same line in another town.

"It is our policy," he explained, "to learn the names of as many customers as possible. Some think we carry it too far, but I assure you it pays in a town of this size, about ten thousand population. That plan may be impractical in the larger cities, but is very valuable in the smaller towns.

"As soon as a new customer enters the place we go after him. If he orders something which is to be delivered, it is an easy matter to get his name and pass it along to the other clerks who may be

called upon to serve him. If he patronizes only the cigar or cold-drink department there may be some difficulty. Very often two friends come in and call each other by name. We are very much on the alert for that sort of thing. Then sometimes an old customer comes in with a new one, and later we ask him his friend's name. We learned your name in that way.

"The clerk who gets the name first passes it along to the others. Thus every employee becomes acquainted with the customer and tries to make him feel at home in any part of the store.

"This matter of learning names is a thing that requires tact, however. It will not pay to make mistakes. If you are not sure of the right name, don't use any at all. We never call any one except an intimate friend by his first name. We avoid nicknames. Even my roommate, 'Boots,' becomes 'Robert' when he comes in here."

The young soda dispenser had talked barely two minutes, but he had said enough to make me think for the rest of the day. The big patronage they had, as well as the words of the junior partner, made me believe there was much good in the system.

A MIDWINTER SALE.

A Business Tonic for the Post-Holiday Dulness—Disposing of Christmas Left-overs—How to Accomplish It—Specimens of the Advertising Used to Overcome the Lethargy of the Season.

Immediately after New Year's comes a lapse of business. A torpid condition sets in as a natural reaction to the holiday rush. A stimulant is needed, something like a "Big Clearance Sale" or the "Special After-Holiday Sale" of the department stores. Whatever be the name of it, the purpose is the same. The aim is to pull in purchasers, to

ADVERTISING THE SALE.

When the sale has been decided on, the advertising should be carefully prepared. Have it live and readable. We are reproducing some good examples of sales advertising in this article. Above all, the newspaper announcements or circulars, whatever the medium employed, must have a sincere ring. People soon find the truth-telling places, and trade gravitates that way with absolute certainty. But this does not preclude interesting news. Dry talk palls on people.

Submit advertising copy to the newspaper at least two days before it appears in order that the cuts for illustration may be properly prepared and the proofs read. The proprietor should see that all advertised

SPECIALS

For To-morrow's Busy Selling

If you have never been to one of our Saturday Sales, you have a surprise in store for you—an economic surprise—an educational surprise—a convincing surprise. When you see these goods at the prices there will be a big tug on your pocketbook. It will be hard for you to keep from buying. Some of the choice specials are:

Rubber Gloves These would be good values at 60c.	41c	SOAP RACKS Nickel, to hang over bath tub. Very shapely and decorative. Made to sell at 75c	58c
TOOTH PICKS Hardwood very shapely—No silvers—Tough and strong—Pkg.	4c	BATH SOAP Elegant cocoa olive—large cake. Very lasting. 10c also	7c
CINNAMON First quality fresh from 2nd year sprouts, bark ground to order. Pkg.	9c	HAIR BRUSH An exceptional lot, fine backs and bristles. Regular 75c value at	47c
BATH MATS 24 x 42, very handsome and desirable. Perfect condition, new, easily worth \$1.25	98c	WHISK BROOMS A basketful of 25c kind—to-morrow only at 19c. About two dozen only. Come early	19c
Violet Perfume Not Piver's or Roger's & Galen's—but certainly an elegant violet extract. Many at \$1.00 no better To-morrow	48c	Water Bottles New bottles of new rubber. Superior to lots offered at \$1.25. To-morrow only	86c

We do business on close margins. That's why business is growing so remarkably. Let us fill your prescriptions—at the right price—our "close margin" price.

(Name, Phone No. and Address here.)

A newspaper announcement of some special attractions—an M. P. Gould ad.

dispose of left-overs from the holiday stocks, and incidentally to sell whatever regular goods can be moved.

The proprietor should inject everybody with a certain enthusiasm in the sale. The clerks should be willing to do a little more than usual. The manager should see that the inside displays, the window dressings and price tickets conform with the advertising. For the public will respond. They appreciate these mid-winter sales. They read the sales ads. in the daily papers with as much interest as they do the news.

HOUSEKEEPERS' SALE DAY TO-MORROW

To-morrow will be a busy day in this store. We will be busy because of the goods offered at these prices.

If you are a housekeeper, and don't come to the store to-morrow, you will certainly miss a chance for decided saving in your purchases. Some of the numerous items are:

Household Ammonia, 10c kind at	7c	Hand Scrubs, easily worth 10c, Saturday	6c
Hartshorn, 10c bottle at	8c	Borax, 10c box for	8c
Baking Soda, the usual 10c package, 2 for	15c	Pure Castile Soap, 10c, Saturday for	8c
Lye, as much as you ordinarily get for 10c, Saturday only	6c	Rubber Gloves, very durable, 85c quality, Saturday only	77c
Witch Hazel, double distilled, Dickinson's Finest, usual 25c bottle at	21c	Crude Oil, 10c bottle, Saturday only	7c
Usual 10c bottle at	8c	Splendid Furniture Polish, 25c size, Saturday	19c
Cleaning Fluid, one of the best things we have ever handled, usual 20c size for	14c	Metal Polish. We don't know anything better than this for copper, brass, nickel, etc., 25c size, Saturday	21c

Spices and extracts. We have put on sale our splendid line at a material reduction for Saturday only in order to get more people to use them. We guarantee them to give satisfaction. Money back if you don't think they are worth the price.

This ad. was originally set up in a single newspaper column and was 12 inches long. We cannot reproduce the vertical arrangement for reasons of space.

goods are properly displayed at the counters. He should be sure, too, that all the people who call are promptly informed as to prices, quality, etc. Slow moving goods should be reported by the clerks at once so that the prices may be lowered and the cash values obtained. Many druggists carry goods over to the next year rather than have a sale and do a little chiseling on the price, but it is well to remember that there is nothing like the cash. Besides it

will soon be time to take inventory, which makes it desirable to reduce the stock.

HANDLING THE HELP.

Sometimes during sales special help is hired. In that event it behooves the proprietor to help the new salespeople. Let him instruct the special clerks how to handle and show goods, wait on customers, make out sales checks if these are used, and in fact see that all duties are intelligently understood. It is not sufficient that new, inexperienced salesmen be given a salesbook and told to go ahead. Thorough instructions must be given in the store's methods of doing business. In order that the inquiries of customers may be intelligently answered, the help should know the location of all the stocks of the store, especially those advertised. Of course, if a proprietor can run a sale without special help that is all the better as it reduces the cost of selling.

Salesmen must keep in good order all stock under their charge. Customers of the house, as well as those in authority, readily recognize who takes an

interest in the business by the display and arrangement of the stock. No excuse can be taken for merchandise that does not present a clean, attractive appearance. Every article should be properly marked or tagged, and each piece of goods ticketed in plain, neat figures, so that a glance will tell price, size, etc.

No matter what the stock is, it should be attractively displayed, and the exhibit changed regularly, having a suitable card on all goods so exhibited. When a sale is completed and clerks are through showing goods, articles should be rearranged as soon as possible, thus avoiding confusion and keeping the selling space clear and in good shape for new business.

SERVING CUSTOMERS.

All customers should be waited upon with equal promptness and politeness, no matter whether the purchase is large or small, whether it is simply an inquiry or an exchange of goods. There should be no favorites among customers. First come, first

1st JANUARY SATURDAY SALE

Every Saturday is Sale Day in our store. Remember that you can always get something at a big saving in price at this store on Saturday. It may be exactly the thing that you have come down town to buy. Next Saturday, January 5th, we offer:

Fifty pairs of wool insoles, fine, soft quality, keep the feet dry and warm, our price 25c, Saturday, per pair **19c**

A lot of very nice chest protectors, soft and warm, made to sell at 75c, Saturday only at **59c**

Russian Violet Perfume, regular price 75c per oz. We want more of our customers to know how good this is, Saturday only the price will be **49c**

Chocolate Caramels sold in many stores at 35c. These are fresh and exceedingly delicious. Saturday only **21c**

Two-qt. hot water bottles, fine quality rubber, in perfect condition, made to sell at 85c in the big stores. Our Saturday price only **79c**

Cold Cream, pure white, made of the finest materials, unexcelled for rough skin and chapped hands, 25c jar Saturday **19c**

We can save you money on prescriptions. None but best materials used. All work done by graduate and skilled pharmacists.

2d JANUARY SATURDAY SALE

Our Saturday Sales grow in interest. More people attend them now. More people are pleased with our Saturday Bargains. Their reputation is spreading all over town. Why don't you save money when it is so easy to save?

A special lot of hair brushes bought for the Christmas trade but arrived too late to get the full benefit of the holiday buying. We now have too many of them on hand. We intended to sell them at \$1.00, \$1.25 and \$1.50. You can have your pick next Saturday at **79c**

Fancy Stationery. The correct shape and papers. Fine envelopes to match. Usually 69c quality **49c**

A nice line of penholders, fancy blotters, writing tablets at special prices; ask to see them.

We want more people to take our Syrup of White Pine, Horehound and Tar. It is one of the best combinations known for coughs and colds, sore throat, hoarseness. The regular price is 25c as everybody knows. On Saturday only you can buy it for **19c**

Tooth Powder at a big saving. A delightfully fragrant, antiseptic, fine powder. Pleasant to use, nothing finer. As large as the usual 25c bottle. Saturday only **16c**

Saturday Candy

Fresh—a big lot just received. These are as nice chocolates as can be bought anywhere for 50c to 60c per pound. If you buy a box and are not satisfied with the quality you can return them and we will hand your money back. We have an immense sale every Saturday. Take home a box next Saturday.

Our prescription business is tremendous. Every drug and chemical being prescribed at this time is in our store. Only graduate experienced pharmacists prepare your medicines if you bring your prescriptions to us. Just remember the price you have paid for an old prescription and bring it to us and see what we charge on Saturday. **29c**

3d JANUARY SATURDAY SALE

We have made especially big preparations for this Saturday's sale. Last week there was such a rush that we couldn't supply one-half the sale-goods called for. You'd better come early though, and avoid the crowd. Some of the goods offered are remarkable bargains.

Rubber Gloves—Just arrived a big stock of soft, flexible, new perfect rubber gloves. Listed to sell at \$1. We want to give them a chance—on Saturday they go for only **79c**

Soaps—Castile Soap, finest and purest quality, or glycerin soap, clear and transparent, or delightfully perfumed soap, your choice at **9c**

Cod Liver Oil Emulsion—It is the thing to take this freezing weather. Gives the body lots of heat and prevents your taking cold. Our regular 85c bottle, on Saturday only, fresh made **77c**

Almond Cream—No need of having any more sore and cracked lips, or rough hands or faces. Almond Cream makes them soft. The purest, whitest, creamiest application, 35c bottle, on Saturday only **25c**

Syrup of White Pine and Tar—Breaks up a cough, soothes an irritated throat, and eases congestion. It's the finest and most pleasant tasting cough syrup you ever tasted. To get you acquainted we will sell a 25c bottle on Saturday at **21c**

We carry a complete line of baby requisites—up to date, dainty and chock-full of comforts for the little one. Just come and have a look.

Remember that perfect and reliable prescription compounding is just as important as a reliable doctor. The doctor can be ever so good, but if his medicine is not put up in the right way, it will not do the right work in the right time. Our prescription department is a matter of pride with us. The drugs and chemicals used are absolutely fresh and full strength; all prescriptions are compounded by graduate and skilled pharmacists. Remember this next time you have a prescription to be filled.

served. A customer who is being waited on should never be left because a liberal buyer, who is well known, approaches the counter. Goods must not be misrepresented. Customers buy upon the understanding that they can get their money back without argument; therefore only true representation must

urging of merchandise upon people is not countenanced, nor is indifference proper. While large sales are important factors with all salespeople, and form in part the basis of their salaries, yet general interest in their duties, the exercise of patience, showing goods pleasantly and cheerfully, polite attention and care in waiting upon customers, are also very important factors in making a success of a sale. Clerks even in a rush should leave a good impression and never let customers go away feeling that they have been treated in an uncivil manner, as it hurts the clerks personally and also the store.

Sweeping should be avoided as much as possible during the day, but the store at all times must be neat and clean in appearance. Clerks should not allow parcel boys to loiter in their divi-

be made. In all matters relating to the sale, due courtesy is required. Clerks are expected to accommodate themselves, as far as possible, to the peculiarities of those they are serving, being civil and polite in their attentions.

If a clerk doesn't happen to have just the article the customer asks for, he should show the nearest he has in stock, and if that won't answer the purpose, consult the proprietor. Possibly it can be procured. Clerks should try to understand what the customer wishes and get it as near as possible, never showing too many goods at a time, as it is confusing and often results in the loss of a sale. If a second customer is waiting, a disengaged clerk should be called. If all are busy, a customer should be asked to wait until one is disengaged. The undue

sion, and should see that all customers are properly served, and the greatest courtesy and politeness shown them, whether buying or simply looking at goods. Strangers from out of town visiting the pharmacy should be made to feel at home, and particular attention paid them.

AN EFFECTIVE RUBBER GOODS DISPLAY.

By J. EARL TAYLOR, Ph.G.,
Gridley, Illinois.

This trim proved a good one, nearly \$25.00 in sales accruing from it. It was a plain "black and white" affair and consisted entirely of rubber goods.

There was a flat base with steps at the back covered in white. The upper part of the background had a canopy effect which stood out about 2½ feet toward the glass, the canopy being sup-

ported by bent wire. The black surface was made of crumpled black tissue paper, onto which at given intervals were pasted the girls' heads which I had cut from old magazine covers and saved.

The white strip across the background was white cloth puffed as shown. White grape leaves adorned the top of the background, while hanging down on the background were pieces of rubber tubing six feet long. The side wall was solid clear pine

covered with dead black tissue paper. The top was decorated with a bar of white puffing across the border, below which was a semicircular white grape vine.

The display consisted of the following sundries: Hot water bottles, fountain syringes, combination hot water and syringe, breast pumps, household syringes, atomizers, teething rings, nipples of all

kinds, bottle cleaners, baby rattles, sponge bags, hard rubber syringes assorted, veterinary syringes, nursing bottle fittings, bottle cleaners, bath sponges, bath brushes, ear and ulcer syringes, female syringes, infant rectals, catheters, colon tubes, pacifiers, etc.; eye pipettes, medicine droppers.

Our windows are about 5½ feet wide but are high off the pavement, which renders it hard to show the full depth in a photograph.

DRUG-STORE SKETCHES.

A CURE FOR THE SUICIDE BUG.

By M. L. DUMBLE.

A druggist in this town with an abiding sense of humor has found a cure for the suicide "bug" that should find favor with his contemporaries throughout the country, not to mention those families afflicted with a "would-that-I-were-dead" member. It was discovered somewhat like this:

The other day, just as Old Sol was putting the loud pedal on the heat key, a youth of about eighteen summers walked into the drug shop and approached the counter with an air suggesting a fixed purpose. His face was chalk-white, his lips twitched, and his eyes wore that expression of terror inspired by a possible idea that his shadow might be going to jump up and give him a knife-thrust in the back.

"Will you sell me a dime's worth of strychnine?" he inquired, pinning his voice down to something like steadiness. Suicide was written all over him in letters a Flatiron block high. Now the suicidal desire on the part of poison patrons was in nowise new to the druggist, but he thought he sighted promise in the boy, and therefore determined upon a course which for originality has all former cures lashed to the post.

"Certainly I'll sell you strychnine. For what purpose is it to be used?" he asked.

"Well," confided the boy, "I'm in love with a woman here in town whose husband abuses her frightfully. My parents object to my paying her attention. This afternoon we had a beast of a row. I won't stand for it any longer—I want to die."

"Very well," the druggist said. "Do you wish to take the poison here? If you do, step into the laboratory and drink all the water you can hold. Strychnine acts more quickly and more effectively when the stomach is filled with water."

The boy seemed not in the least perturbed by the acquiescence of the man and was game to the finish. "I can't drink another drop," he said some minutes later after guzzling down an enormous quantity.

"All right, then, swallow the strychnine." And he did—a whole tablespoonful of it without wincing! "If you will step out here," said the obliging druggist, leading the way to the rear door, and lie down on that large box over in the corner of the yard, you will be dead in five minutes."

The boy sought the box as directed, and lay himself down in an attitude popularly supposed to be becoming in death, while the man returned to his shop and to the wants of less morbid patrons.

In about five minutes a showily dressed woman of apparently twice the age of the youth rushed frantically into the store and asked for "James."

"Do you mean a tall, lanky youth, dressed in a light gray suit?" inquired the druggist.

"That's James. Oh! tell me quick, what did he buy?"

"I sold him a dime's worth of strychnine and he took it here. He is out in the rear yard trying to die now," nonchalantly answered the man, handing out a bottle of Peruna to one customer and a package of Rocky Mountain Tea to another.

"Murderer!" hissed the woman, as she made a dash for the rear.

A few minutes later the accused criminal took a peek out of the back door. The would-be suicide, who had ardently wooed the death angel and the shelter of her dull gray wings, was now in the midst of a terrible nausea. It was racking his body in a way that made a Detroit excursionist in a lake storm look like a mean imitator. The woman was wringing her cheaply jeweled hands and attempting to do an emotional scene from a Charles E. Blaney melodrama, with Bertha M. Clay lines.

But the boy would have none of her. He wildly waved her away, expressing in no tender terms a consuming desire to be "left alone." Whereupon the woman went away in a huff, declaring him an ungrateful little monster. Shortly thereafter, when the heaving sensation had somewhat abated, the lover who wanted to launch himself across the Great Divide on a suicide ferry, beat it ingloriously, via the back alley. He had swallowed a goodly portion of zinc sulphate, than which there is no suicide cure more efficacious.

In the excitement everybody forgot the names of the actors, but any "James" may claim the leading rôle in this near-tragedy that turned out to be pure farce-comedy.

To the Editors:

Enclosed find money order to pay for my subscription to your most excellent journal for the coming year. I am taking several drug journals, but I consider yours head and shoulders above them all.

V. P. WETTERGREEN.

Bridgewater, S. D.

BOARD QUESTIONS ANSWERED.

AN INDIANA EXAMINATION.

PHARMACY.

(Continued from December BULLETIN.)

8. (a) Fluidextracts—Define. What strength of the drug do they represent? Outline a process for making. (b) Extracts—Define. Outline process for making. What strength of the drug do they approximately represent?

(a) Fluidextracts are concentrated alcoholic or hydroalcoholic solutions of vegetable principles, which are permanent and represent all the active virtues of the drugs from which they are made. One gramme of the drug is represented by 1 Cc. of the fluidextract, with the exception of several fluidextracts which are adjusted by standardization to definite alkaloidal strength.

One thousand grammes of the powdered drug of the prescribed degree of fineness are thoroughly moistened with a certain quantity of the initial menstruum and packed more or less firmly in a cylindrical percolator; the drug having been properly covered with a paper diaphragm, enough menstruum is poured on to saturate completely the powder and leave a stratum above it. When liquid begins to drop from the percolator, close the lower orifice, and having closely covered the percolator to prevent evaporation, macerate for forty-eight hours. Then allow percolation to proceed slowly, gradually adding menstruum (alcohol or alcohol and water) until the drug is exhausted. Reserve the first 700 to 900 Cc. of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion and add enough menstruum to make the fluidextract measure 1000 Cc.

(b) Extracts are permanent, soft, solid or dry preparations obtained by evaporating a solution of the medicinal principles of a drug. The Pharmacopœia recognizes 27 extracts, of which 18 are directed to be made from the drug direct and the remaining 9 by evaporating the official fluidextracts of the respective drugs. Alcohol, water, or mixtures of the two, and ether are used as menstrea; sometimes either acetic acid or ammonia water is added to the solvent. The manipulations necessary to produce extracts include maceration, expression, percolation, decoction, infusion, evaporation, use of steam heat, vacuum apparatus, etc. The details of

the formulas vary so much that a general formula for all is impossible. Powdered extracts consist of the dry extract powdered and incorporated with a suitable diluent, such as milk sugar, powdered licorice root, etc. The strength of an extract is from four to five times that of the drug.

9. (a) Tinctures—Define. Outline process for making by maceration and by percolation. Of what various strengths are they? Name four, giving their percentages of strength. (b) Infusions—Define and tell how made.

(a) Tincture is the name applied to solutions of non-volatile or only partially volatile substances in liquids other than simple water or glycerin, and which invariably contain alcohol.

Wherever tinctures are to be made by maceration, the Pharmacopœia directs that about three-fourths of the total menstruum be added to the powdered drugs and the mixture set aside in a shady place at a temperature of about 15° to 20° C. (59°-68° F.) with occasional agitation. The length of time required for maceration varies for different drugs, from 2 to 14 days, and is specifically stated in each official formula. At the expiration of the specified time the mixture is filtered through absorbent cotton, and when the liquid has all drained off sufficient menstruum is passed through the dregs to bring the volume up to the required measure.

Where tinctures are made by percolation, the Pharmacopœia, with very few exceptions, directs that the powder, having been moistened with the prescribed quantity of menstruum, shall be set aside without being compressed for a period varying from three to twenty-four hours before it is packed in a percolator. Having been properly packed and saturated with menstruum, it is allowed to macerate for 24 hours (in a few cases 48 hours) before percolation is started. This preliminary treatment is intended to insure more thorough penetration of the cellular tissue by the menstruum, and has been found very effectual in furthering the extraction of the soluble principles sought.

The strength of the tinctures of the U. S. P. varies from 1.6 to 50 grammes of drug, being in the majority of cases 10 or 20 grammes for every 100 Cc. of finished product. Hyoscyamus, 0.07 Gm. of mydriatic alkaloids in 1000 Cc.; aconite, 0.45 Gm. of aconitine in 1000 Cc.; nux vomica, 1.0 Gm. of strychnine in 1000 Cc.; opium, 12-12.5 Gm. of crystallizable morphine in 1000 Cc.

(b) An infusion is a preparation of a vegetable drug made by introducing the substance coarsely

divided into a suitable vessel and pouring thereon boiling water. The cover is let down and the product allowed to macerate for half an hour. Then it is strained with expression, enough water being passed through the strainer to make up the yield.

10. Emulsions: (a) Outline a general formula for making emulsions of heavy oils, giving order of mixing. (b) Of volatile oils.

(a) Not less than one-fourth nor more than one-half as much acacia as oil should be used, and not less than one and a half times nor more than twice as much water as acacia. Place in a mortar (flat-bottomed preferably) one-fourth as much *finely powdered* acacia as the oil to be used (7.5 Gm. of acacia for 30 Cc. of oil, or 2 drachms for 1 fluid-ounce), then add the oil and triturate well together into a smooth mixture. Now add *all at once*, not gradually, twice as much water as the acacia which has been used (15 Cc. of water for 7.5 Gm. of acacia, or 4 drachms for 2 drachms), and stir rapidly until a perfect emulsion has been formed, which is known by the appearance of a white pasty mass, free from oil particles, and a peculiar crackling noise as the pestle is drawn through the adhesive mixture. This primary emulsion should be well scraped with a spatula from the pestle and sides of the mortar, again stirred, and then the remainder of the water slowly added with constant stirring.

(b) To emulsify a volatile liquid, pour it into a perfectly dry bottle, add the powdered acacia, and shake well so that the acacia may become saturated with the volatile liquid. Then add water and continue to agitate until a homogeneous emulsion results, which can be further diluted by the gradual addition of water. Volatile oils and ethereal liquids will never form as perfect an emulsion as fixed oils, and separation of the mixture takes place more speedily. If care has been observed, however, in making the mixture, only a dense creamy layer will rise to the surface, which can be reincorporated by agitation. As a rule, volatile oils and ethers require more gum than fixed oils, and less than 30 grains of powdered acacia should not be used for each fluidrachm. The amount of water first added should always be equal to twice the acacia used. All emulsions of volatile oils are more permanent if made with the aid of some fixed oil previously added to the volatile oil; such emulsions are preferably made in a mortar.

11. (a) How do laudanum, deodorized tincture of opium, and paregoric differ? (b) How do water of ammonia, stronger water of ammonia, spirits of

ammonia, and aromatic spirits of ammonia differ? (c) How would you make water of ammonia from stronger water of ammonia?

(a) Laudanum is merely a hydroalcoholic extract of granulated opium, 10 per cent. Deodorized tincture of opium has the same morphine strength, but here the percolate is deprived of its peculiar nauseating principle to which the characteristic odor of the drug is due by first making a concentrated infusion and then shaking this with benzin. It is of lighter color than the ordinary tincture of opium and has not the disagreeable narcotic odor of the latter. Paregoric contains only 0.4 per cent of powdered opium together with camphor, benzoic acid and oil of anise.

(b) Ammonia water contains 10 per cent by weight of gaseous ammonia; stronger ammonia water, 28 per cent. Spirit of ammonia is an alcoholic solution of ammonia, containing 10 per cent of the gas, by weight. Aromatic spirit of ammonia is a hydroalcoholic solution of normal ammonium carbonate, containing 70 per cent by volume of alcohol, 1 per cent of oil of lemon, and 1/10 per cent each of oil of lavender flowers and oil of nutmeg.

(c) By diluting the stronger solution to 2.8 times its volume with water.

12. Give the pharmacopœial names of (a) salts of tartar, (b) cream of tartar, (c) tartar emetic, (d) white, (e) blue, and (f) green vitriols, (g) lunar caustic, (h) aqua fortis, (i) Spanish fly, (j) basicon, (k) citrine, and (l) blue ointments, (m) red and (n) white precipitate, (o) calomel, (p) corrosive sublimate, (q) Monsel's salt, (r) Epsom and (s) Rochelle salts, (t) sugar of lead, (u) caustic potash, (v) borax, (w) carbolic acid, (x) synthetic oil of wintergreen, (y) synthetic oil cassia, (z) urotropine.

(a) Potassii carbonas, (b) potassii bitartras, (c) antimonii et potassii tartras, (d) zinci sulphas, (e) cupri sulphas, (f) ferri sulphas, (g) argenti nitras fusus, (h) acidum nitricum, (i) cantharis, (j) ceratum resinæ, (k) unguentum hydrargyri nitratis, (l) unguentum hydrargyri dilutum, (m) hydrargyri oxidum rubrum, (n) hydrargyrum ammoniatum, (o) hydrargyri chloridum mite, (p) hydrargyri chloridum corrosivum, (q) ferric subsulphate, (r) magnesii sulphas, (s) potassii et sodii tartras, (t) plumbi acetat, (u) potassii hydroxidum, (v) sodii boras, (w) phenol, (x) methylis salicylas, (y) cinnaldehydum, (z) hexamethylenamina.

(To be continued.)

DOLLAR IDEAS.

A NURSES' DIRECTORY.

Joseph Hart, Spokane, Washington: For a long time nurses' directories have been conducted in some stores, and owing to the recent and growing demand for trained nurses many druggists are now starting one. Let me present a very crude drawing and a little explanation of the directory I found to be not only the least costly but the most satisfactory.

A board is used which is one inch thick, forty

inches long and fifteen inches wide. In it is a cut or cavity about $\frac{1}{4}$ inch so as to protect the cards. The board is attached to and painted to match the fixture nearest the private store telephone. This board is divided into five rows of small tin ribbons of two strips each, festooned with small nails, leaving enough room between nails to pass the small cards ($1\frac{1}{4}$ by $1\frac{1}{2}$ inches) and hold them securely in place. These five rows are divided into three sections as illustrated.

Two complete rows are used for graduates, two for undergraduates, and one for practical. On the small cards are written the names, the kind whether

graduate, undergraduate or practical, telephone number and cases preferred. If contagious diseases are objectionable this is also noted. As demands for nurses are generally by 'phone, one readily appreciates conciseness. Apropos, the names are not arranged alphabetically but as to cases, namely, preferable, objectionable, and general. It is well to note on back of each card whether the nurse is willing to take out-of-the-city cases.

Every name on the ready reference board has a corresponding name on a larger card which is kept in alphabetical order in a one-drawer cabinet file. These cards bear all the information that is on the smaller one, and in addition the school from which the nurse graduated and hospital where instruction was received, references, doctors in particular, present residence and home.

When the nurse is reported on a case, the smaller card is filed with the larger one in the cabinet, and is again replaced on the board when she is ready for another case.

By all means avoid the question of salary; leave that to the people interested. I do not think it a good plan to charge for registering; however, some druggists do. Vouch for no one. Merely give what you have on your card when information is asked.

Supply the nurses on your register with clinical charts having your advertisement of sick-room requisites.

BUILDING BUSINESS ON FUMIGANTS.

J. C. Lowrie, Weidmann, Ontario: A scheme that we have used for some time with a great amount of success is that of advertising a disinfectant, using the formaldehyde and potassium permanganate preparation which is familiar to all druggists, but perhaps our method of bringing it before the public notice may be new to many.

The majority of druggists carry the disinfectant in stock, but let the business come to them rather than go after it. The preparation brings a handsome return, but the druggist must use his own judgment on the price.

The majority of people, after the death or sickness of one of the family, desire to disinfect the house. Therefore on hearing of any instances of death or contagious disease, we send out printed matter announcing that we have the disinfectant in stock and explaining that ours is the best on the market in points of price, quality, safety, etc. As a

The result of our scheme is that we have worked up a large business in this particular line.

Count the cost of each prescription, and at the close of each thirty days take an invoice of your prescription work, and then to the physician sending you the most profitable month's work give a complimentary box of cigars, say twenty-five in the box. Not only judge the file by its cost, but also consider the writing, the style of blank used by the physician, and mark him down especially if any other blank than your own is used. Give each doctor credit for all refills. Try it.

F. Boettger, Peoria, Ill.: The following formula for cold cream is somewhat similar to the usual recipes excepting that it contains a little benzoic acid. Products without this ingredient will gradually acquire a smell, slowly, it is true, but surely.

If firmer cream is wanted use more wax. Neutral oil is also called petrolatum oil.

[illegible]

F. C. Heupel, Laporte, Ind.: Here is another help for marking goods in addition to using adhesive plaster. I use an indelible lead-pencil to mark the cases containing pocket combs and any other dark objects that are not injured by being so marked. Turning them towards the light enables the marking to be seen plainly. This method is much quicker than fastening plasters or tags on the goods.

LETTERS.

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

FOUR LETTERS REGARDING THE USE OF STAMP-VENDING MACHINES.

So many druggists are now using slot machines for the sale of postage stamps that the editors of the BULLETIN were curious to know how successfully the idea was working out, how much of a relief the instruments proved to be, and whether or not the public took kindly to the change. We asked four druggists to give our readers the benefit of their experience, and their letters follow:

To the Editors:

I have your letter of October 18 requesting a recital of our experience with the "Silent Partner" postage-stamp machine, made by the Automatic Service Company of this city.

This machine carries 100 pockets, each pocket containing four 1-cent stamps. The purchaser deposits a nickel in the slot, and upon pressing a lever one of these pockets presents itself and delivers to the purchaser the four stamps.

We installed one of the machines in our Broadway store June 16, 1909, and up to November 1 the gross profits have been \$70.50, one-half of which has gone to the company and the other half to ourselves. Recently the company has offered these machines for sale instead of placing them on a commission basis. As this meant a profit of something like 100 per cent on the money invested for the time we have had the machine, we immediately purchased one.

We have no difficulty in advising our customers to use the machine, as the more intelligent class realize that stamps are usually sold in a pharmacy as a matter of accommodation. They are willing to pay for this accommodation, and I can see no reason why any pharmacist should hesitate to install such an instrument as it not only pays a good profit, but, being automatic, takes care of itself. In view of the fact, furthermore, that the old telephone nuisance has been remedied by the use of the slot 'phone, it may be said that the community at large is gradually waking up to the fact that the pharmacy is no longer a place of accommodation and a free information bureau.

I might add that the company installs machines for the sale of 2-cent stamps as well as those for penny ones.

BRADT DRUG COMPANY,

Albany, N. Y.

By WARREN L. BRADT.

To the Editors:

In reply to your letter regarding stamp-vending machines, we would say that we are heartily in favor of this solution of a fixed problem. There are of course many sides to this question, and the location and character of an individual store must to a certain extent be taken into consideration. We personally find the use of stamp-vending machines a great advantage to us in that they give us time to attend to our regular customers while the stamp customers have to attend to themselves. Before we used the machines we found that we were spending a great deal of time waiting on stamp customers, who usually required three times as long to get their money ready as it took to sell them a stamp, and in the meantime regular customers were getting impatient or going out because they were not waited on. While we undoubtedly lose a few customers who do not approve of this method of handling stamps, yet we do not think that this loss amounts to enough to be considered, certainly not to as much as we suffered through the loss of customers not being waited on while we were selling the stamps. The greatest drawback to stamp vending machines that we have seen thus far is that they are not perfect and will get out of order. When they work they are a great relief. We wish to reiterate, however, that we are in favor of the stamp-vending machine, even a machine that sells the stamp at the face value.

A. B. HUESTED & Co.

Albany, N. Y.

To the Editors:

We have been using the Thexton Stamp-vending Machine for the past eighteen months and find it satisfactory in every respect.

This machine, to our way of thinking, provides the very best solution of one of the aggravating troubles of the retail druggist, viz., the handling of postage stamps. Furthermore, the great majority of our customers take very kindly to the machines operated in our two stores.

We cannot recommend the stamp-vending machine idea too highly, and we think that when brought to the attention of progressive retailers they will become equally interested and coincide with our views.

A. D. THOMPSON DRUG Co.

Minneapolis, Minn.

To the Editors:

Replying to your recent favor regarding stamp-vending machines, I take pleasure in saying that I have had in my drug store one of the Thexton machines for several months and have found it a splendid convenience.

It not only does away with all trouble connected with the selling of postage stamps, but proves quite an attraction in the store, as may be proved by the great increase in the sale of stamps since the machine was installed.

I also find the advertising feature connected with this machine very effective, direct, and at the same time inexpensive. I cannot speak too highly in favor of the device.

C. F. FISCHER.

Minneapolis, Minn.

A STOCK CARD RECORD FROM A DUBLIN DRUGGIST.

To the Editors:

Your BULLETIN for October has just reached me, and, as usual, I have lost no time in getting through it, from cover to cover, for I seldom fail to come across many things well worth scoring for future reference. More than once your "Dollar Ideas" have given me a groundwork on which to build plans, perhaps not exactly as suggested, but still proving extremely useful. In return for these ideas which I have received I should like to return the compliment and send you one of mine, which I found saved in the first twelve months much more than its initial cost. It originated with the great difficulty which I experienced in checking invoices, for one cannot possibly remember the history of each article in his pharmacy.

Every line on every invoice I receive I copy out on cards, such as I enclose. These are arranged alphabetically, with index cards. They are kept under several heads: Drugs, Patents, Sundries, etc. Each card represents one drug or patent, as the case may be. When the cards have been in use for some time, by removing any single one from its place it at once indicates the following:

1. The different dates supplies were received.
2. The amount of each order and how long it lasted.
3. The cost price as entered on each invoice, with discount and cartage.
4. The source of supply.
5. The retail price charged.

No. 1 and No. 2 at once show how the stock is moving, and guide future ordering. They tell you

how much you use in any given period, etc. No. 3 tells at once whether a uniform price has been charged throughout, more especially if it is obtained from different sources. If the charge varies without cause, which I have frequently found out, it should be indicated on the invoice, and deducted at

A stock record used by Hanna, of Dublin.

settlement. It also shows the saving, if any, obtained by purchasing in large quantities.

A cabinet with four drawers, each capable of holding 1000 cards, cost me 16/6 (\$4.12), while 4000 cards, specially ruled to my requirements, cost £2 (\$10).

Perhaps the method of thus registering stock already obtains in many pharmacies throughout your country, but I submit these particulars nevertheless.

Dublin, Ireland.

VICTOR E. HANNA.

SELL THE THINGS ADVERTISED IN THE MAGAZINES!

To the Editors:

A window display suggestion which you had on page 380 of the September BULLETIN was used in the store and met with great success. It was the one called "If it's advertised we have it." and it had reference to the things advertised in the magazines. We adopted this idea but improved on it by attaching different colored strings from the articles themselves to the magazine ads. that we hung all over the back of the window. The local paper said of the trim:

"Kendall's Pharmacy has a very novel window. Take a look—it's worth it."

This brought a great many people into the store to ask whose idea it was, and for some unknown reason attracted the ladies especially. I thank you for the fine suggestion.

LIONEL F. MILLER.

Saranac Lake, N. Y.

'TWOULD TAKE A LOT TO FIX ALICE UP!

To the Editors:

Enclosed please find a note which I received a few days ago. I have seen a good many of this kind in

*Tchula Miss
Dr M P Winkler I am
Sore in from my head on
down in the inside
and under the side of my
eyes it sore and I cant
go to sleep and Ben that
has fat a month and
every one of my bones
I look like Iil coming
in to and please send
me a Serreon and my
something to eat it is
saint me and my
Stomach is out of order
Alice*

the BULLETIN and I think it deserves recognition among the other specimens. Incidentally let me say that I like the BULLETIN very much.

Tchula, Miss.

M. P. WINKLER.

SAPONIFIED COAL-TAR CREOSOTE.

To the Editors:

In looking through the last number of the BULLETIN I notice in answers to queries the suggestion to F. B. M. that he use liq. cresolis compositus for saponified coal-tar creosote.

While it is true that the official preparation of cresol is in a sense a creosote, I am inclined to believe that F. B. M. wants a product similar to that exploited by a number of firms as stock dips, etc. A preparation of this sort may be made with the following formula:

Ordinary lubricating oil.....2 parts.
Crude carbolic acid.....1 part.
Liquor cresolis compositus.....1 part.

This gives a product varying in content of cresylic acid from 15 to 20 per cent, depending on the strength of the carbolic acid. It mixes in all pro-

portions with water, yielding a milky solution which is reasonably permanent. The commercial product sold by most refineries is made with a rosin soap instead of the official article, which makes it much cheaper, but is not a very practical method for the average pharmacist. Incidentally this preparation may be made a profit-bearer for the druggist.

I hope this will answer the query and trust it may be of interest to other druggists who believe in originality.

JOHN C. ENDRESS.

Crown Point, Ind.

FROM ANOTHER EDITOR.

To the Editors:

I have no doubt that you have readers for all the features of the BULLETIN, but the one feature that interests me the most is the new series of "General Essays" in the back of the journal upon morals and manners by the editor. I want to suggest that you drop your modesty and put these disquisitions in "ten-point" instead of "eight-point" type.

Boston, Mass.

JOSEPH C. HAGAR,
Editor of *The Apothecary*.

IT STRUCK TWELVE!

To the Editors:

The publication of my article in the November BULLETIN entitled "Getting Business on Merchants' Booster Sale Days" proved to me that the BULLETIN OF PHARMACY has a wide circulation. I received requests for copies of the "Booster Sale Book" from all parts of the United States, as well as numerous letters from secretaries of merchants' business associations.

O. R. NORRIS.

Whitley, Indiana.

To the Editors:

I certainly think the BULLETIN OF PHARMACY takes the lead in style, information and all the points necessary to make up a fine trade paper.

Malden, Mass.

HORACE E. NEWCOMB.

* * *

To the Editors:

I can no more get along in the drug business without the BULLETIN than I can without my pharmacist's certificate.

CHAS. MINER,
Manager The Algonquin Pharmacy.

Sault Ste. Marie, Mich.

BUSINESS HINTS.

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

Conducting a Professional Pharmacy.—

Elsewhere in this issue of the BULLETIN, in the "Hall of Fame," we are printing the portrait of W. C. Bender, of St. Joseph, Mo., and are also saying a few words about Mr. Bender's official positions in pharmacy. In this place it may not be uninteresting, in order to show what kind of a store

An Ethical Pharmacy

WE try to conduct a strictly Ethical Pharmacy. We do not make or recommend any patent medicine, but advise our patrons to consult a regular physician. ¶ So many times a physician is asked, "Where shall I take my prescription?" ¶ If you want just what your prescription calls for, quick service, as well as high-grade chemicals, remember

BENDER PHARMACY

Eleventh St. and Frederick Ave. Phones 700
Messengers on Wheels—Free Delivery

Mr. Bender conducts, to reproduce an announcement which he recently distributed to the public of St. Joseph. It was neatly printed on what might be called stationery stock, and was of such a size and shape that, folded once, it would go in a No. 6 commercial envelope.

A Druggist's Exhibit at a County Fair.—

W. E. Bingham, Tuscaloosa, Ala., is pretty well known to the N. A. R. D. membership throughout the country. He

is always to be found at the national meetings and usually acts in the capacity of one of the secretaries. The Bingham

Drug Co. turns out a number of specialties of its own, and Mr. Bingham believes in pushing these rather vigorously. At the county fair held at Tuscaloosa in October an exhibit of the Bingham preparations was made, and a view of this may be seen in the accompanying engraving. Among other products on exhibition were Bingham's Chill Pills, Bingham's Dyspepsia Remedy, and Bingham's Rheumatism Remedy. All of the Bingham preparations are guaranteed and are sold on the "your-money-back-if-not-satisfied" basis.

A Somewhat Unique Newspaper Ad.—

The two stores of the Gray & Worcester Co. of this city are now, and have been for several months or a year, a part of the group of thirty or more establishments controlled by the Louis K. Liggett Co. in the East. Readers of the BULLETIN will recall that Louis K. Liggett is the president of the United Drug Co. and that he formed a corporation to take over the retail stores which had been purchased from time to time by the Rexall people. The Gray & Worcester Co. are now running a series of newspaper ads. in the local papers, of which the accompanying reproduction is a specimen. The

[illegible]

original of this ad. occupied nearly a quarter page of newspaper space, and we have had to reduce it greatly in size in the preparation of our etching for the BULLETIN.

A Verse-writing Druggist.—

Fred W. Conrade has sent out an announcement informing the public of his immediate vicinity that he is back in business again at 1122 Linden Avenue, Chicago. The circular for the most part is given up to this statement, and Mr. Conrade tells his old customers that he will be glad to serve them again. Incidentally he inserts the following verse as being appropriate to the occasion:

Back to the farm is the talk of the day,
Back to the pharm-acy I've come to stay.
Back to the drug store I invite you to call,
Old ones, young ones, little ones and all.

CAPSULES OF SCIENCE.

Prepared by Prof. W. L. SCOVILLE.

Odds and Ends.—

E. Kazay says that artificial camphor has a single bond and natural camphor a double bond, which accounts for the difference in refraction and polarization of the two.

J. C. Umney says that oil of rose is very skilfully adulterated in such a way that chemical analysis will not show it. He believes that judgment on the delicacy and permanence of the fragrance is of great importance.

A special safe for keeping radium has been made for the British Radium Corporation. It required a 3-inch lead lining and a specially fitted door to keep the emanations inside.

Schering proposes to cure constipation by injecting a solution of digestive juices into the muscles of the patient. Such an injection causes peristalsis.

Water distilled from a copper still is said to have an oxidizing action, owing probably to minute traces of dissolved copper, which are too small to react to the usual copper reagents.

The decolorizing properties of fullers' earth, kaolin, and other clays is said to be due to the colloidal portion of the clay, which forms absorption compounds with the coloring matters.

Two to four per cent of powdered marshmallow root added to plaster of Paris will retard the setting of the latter (about an hour), but make a harder and tougher mass when finally set.

A French chemist says that yolk of egg develops a toxic body with age, which is not due to bacterial action.

About Emulsions.—

Two French chemists have been studying emulsions, and say that the rate at which an oil forms an emulsion and the stability of the emulsion increase as the surface tension of the neutral oil is lessened. Sodium or potassium sulphuricinate is a pronounced emulsifying agent because it materially reduces the surface tension of the oils and also the water, and in addition it favors hydrolysis of the oil. By prolonged agitation with pure water a stable emulsion can be formed with an oil, without any emulsifying agent being present, due to hydrolysis. The presence of mineral salts favors such an emulsion, but hinders emulsification with soap or gums. Fatty acids emulsify more easily than neutral oils, and make stable emulsions.

Gums emulsify by reducing the surface tension, and hold the emulsion by forming a protective coating about the oil particles.

Every solid or liquid substance which can be precipitated in very fine particles may act as an emulsifying agent, particularly if it reduces the surface tension of the liquids.

By the simultaneous use of colloids and of fine emulsions an oil is easily emulsified. Yolk of egg and milk are such agents.

When soap is used as an emulsifying agent it should be dissolved in the smallest possible amount of water, then the oil added gradually. Potassium soaps are better for emulsions than sodium soaps.

Whaddy Ye Know 'bout That?—

Prof. C. A. Herter has been studying the effects of sodium benzoate, and says: "There is no soluble substance that can be taken into the digestive tract which does not possess toxic properties in some degree when given in sufficient quantities or concentration. Sodium benzoate is no exception to this rule. This consideration, however, does not alter the fact that sodium benzoate used as a food preservative is singularly lacking in harmful effects on the human organism, and that ill effects from its reasonable use have not yet been demonstrated."

Biological Brass.—

In order to ascertain whether copper in minute quantities prevents the action of putrefactive bacteria, or only covers the putrefaction by destroying its odor and other evidences, A. Springer treated some eggs with copper solution until the copper could be detected in the albumin, then found that the eggs so treated would hatch. The copper therefore does not prevent normal development.

Better for the Gums.—

It is claimed that cocaine arabate is much better for hypodermic injections than cocaine hydrochloride because it is absorbed much more slowly, hence is less toxic, the action is more prolonged (about three times the duration), and it is less irritating. German patents have been taken out on its preparation.

Another Placebo.—

Prof. F. B. Power has made a thorough examination of pumpkin seeds and finds them to contain an oil, a trace of resinous matter and of salicylic acid. Neither the oil nor resin showed any physiological activity, and it appears probable that the use of pumpkin seeds as a vermifuge is without value.

Toxi-colloidal Lead.—

Pure water acts on lead quite rapidly in the absence of air, forming a colloidal solution of lead. On exposure to the air, lead oxyhydroxide is formed and precipitated, the latter being insoluble in water. The presence of salts in the water hinders, or may entirely prevent, this solvent action on lead.

The Wrong Polish.—

The Eastern Association of Tropical Medicine has decided that beriberi is caused by the continuous consumption of polished rice, which has been deprived of its pericarp and is deficient in phosphates. By using whole rice, or adding phosphates to the diet, the disease may be prevented.

Radiumized Glass.—

Glass is made to contain small amounts of radium sulphate, which is claimed to impart a permanent radioactivity to it, and make it useful for medicinal or scientific uses.

Wilful and Woful.—

The West Virginia gas wells are estimated to give out thirteen hundred million cubic feet of gas per day, of which three hundred million feet are wasted.

BOOKS.

CULBRETH'S MATERIA MEDICA AND PHARMACOLOGY.

While pharmacognosy and pharmacology are separate and distinct sciences, there have been attempts to cover both subjects in a single volume. An unusually successful effort of that kind may be seen in Culbreth's *Materia Medica and Pharmacology*.

This book, now in its fifth edition, furnishes a complete text for students and an encyclopedia of reference for physicians and pharmacists who wish to look up any point in the materia medica and pharmacology of the entire range of drugs covered in the United States Pharmacopœia. Professor Culbreth combines the qualifications of wide and accurate knowledge and skill in teaching. In this new issue he has embodied the vital changes in the U. S. P., made since the revision of 1905, which are difficult of access elsewhere, has scrutinized every page for possible improvement, and has included many new remedies of merit accepted by the medical profession. Among the notable additions may be mentioned the sections on the opsonic theory and radioactivity. Every line has been carefully reviewed with the object of incorporating the latest research and bringing the entire volume thoroughly abreast of its subject. The work is profusely illustrated. There are 986 pages with 487 illustrations.

The book is published by Lea & Febiger, Philadelphia and New York, and costs \$4.75 net in cloth.

THE NEW REMEDIES OF 1909-1910.

The number of synthetics and "new remedies" in general brought out every year runs up into the hundreds. Several books have been exclusively devoted to the subject and have from time to time been reviewed in these columns. Before the type is cold, however, additional substances are thrown upon the market, and the need therefore becomes apparent for supplementary literature. The American Druggists' Publishing Co. has just brought out a little paper brochure of 22 pages giving brief descriptions of the new remedies of 1909-1910 and containing prefatory remarks on the subject in general. We believe the price is ten cents.

PLANT ANATOMY.

The first edition of a volume on this subject, by William Chase Stevens, of Kansas University, was issued in 1907 and reviewed in the *BULLETIN* of January, 1908. The present edition does not differ in typography or dress from that of the first. The only difference in subject-matter is the inclusion of a chapter on reproduction, made necessary by the rapid strides of biological research on the subject of plant and animal breeding and their bearing on the problems of evolution. This chapter deals with the various processes through which the reproductive tissue passes from its origin to the completion of the reproductive body—the spore for ferns and the seed for the higher plants; also hybridization, Mendel's laws, chromosomes as bearers of heredity, character, etc. The chapter is illustrated with sixteen figures show-

ing various stages in the formation of the reproductive organs of both the flowering and non-flowering plants and showing the different processes through which the chromosomes have passed during a double nuclear division and the positions assumed. Stevens' *Plant Anatomy* is published by P. Blakiston's Son & Co., Philadelphia, and costs \$2.00 net.

DAGGETT'S PHARMACEUTICAL CHEMISTRY.

We have had pleasure in reading over the "Theory of Pharmaceutical Chemistry," by Charles H. Daggett, Ph.G., Ph.C., Professor of Theoretical Pharmacy and Organic Chemistry in the Rhode Island College of Pharmacy. In this volume Professor Daggett has collected and systematized a mass of special information which heretofore could only be acquired by an extended search through numerous works of reference, a task calling for an expenditure of patience and labor. The author's long experience as a teacher of this special branch of pharmaceutical knowledge is a satisfactory earnest that the subject has been handled with intelligence, lucidity, and completeness. The book is visibly intended to explain the Pharmacopœia, and to that end the sections on both inorganic and organic chemistry have been adapted.

The publishers are Lea & Febiger, Philadelphia and New York. Cloth, \$2.75 net.

STATE PURE DRUG LAWS.

The National Wholesale Druggists' Association has published a new edition of the pamphlet containing a synopsis of the State pure food and drug laws enacted since the passage of the Federal act. The present book covers all of the new statutes up to September, 1910, and it also includes the narcotic laws of the different States, the Massachusetts wood alcohol law, the New York ant substitution law, and certain other measures. These pamphlets are gotten out by the N. W. D. A. for the use of its members, and we are not prepared to say whether they would be sent upon request to others. At any rate, the books are very valuable ones. They are issued from the office of the secretary—J. E. Toms, 81 Fulton Street, New York City.

E. MERCK'S ANNUAL REPORT.

Recent advances in pharmaceutical chemistry and therapeutics are well set forth in E. Merck's Annual Report. Remedies of modern introduction are described and very often the medical properties are given at some length. Atoxylic mercury, for example, is mentioned, with a discussion of its pharmacological action on the lower animals and its clinical effects on the human. The book obviously aims to give the chemical nature of the newer remedies together with a brief résumé of their medical properties. New uses for the older chemicals are also suggested. Several pages are devoted to serum therapy, and therapeutic preparations made from bacteria. E. Merck's Annual Report comes from the chemical works of E. Merck, Darmstadt, Germany.

PRACTICAL PHARMACY.

A condensed work on this subject has recently been completed by Birdsey L. Maltbie. It is not intended to replace the larger and more complete books, but to afford the

student a course of study by which he may master the subject in an elementary way. The author believes that physicians and medical students in particular will find in this book all of the necessary knowledge of pharmacy in a form that will be readily understood without explanations by a teacher. Maltbie's Practical Pharmacy contains 432 pages and costs \$3.00 in cloth. It is published by the Physicians' Drug News Co., Newark, N. J.

FOR THE PHOTOGRAPHICALLY INCLINED.

The "Welcome" Exposure Record includes descriptions of negative making, factorial, time, machine, tank or stand development, color photography, bromide printing, gaslight printing, lantern slide making, toning, intensification, ozobrome and bromoil. Ample provision is made for notes and memoranda, and the book is bound in neat pocket-book form, with a pencil, automatic catch, and wallet, so that it may conveniently become the photographer's companion on all excursions and obviates the necessity for any other notebook. It may be obtained from all photographic dealers and booksellers and at all railway bookstalls. The price in the United States, exclusive of postage, is 50 cents.

TWO CALL LISTS.

We have recently received from the publishers copies of two standard physicians' call lists, both gotten out for 1911. The Physicians' Perfect Call List and Record is published by E. G. Swift, Detroit, Mich. The Physicians' Visiting List is issued from the press of P. Blakiston's Son & Co., 1012 Walnut Street, Philadelphia. Both books are doubtless familiar to our readers, and both have commended themselves year after year to the physicians of the country.

THE SERVICE DEPARTMENT

In this new department of the BULLETIN the market wants are indicated of those subscribers who are not able to find what they desire, and who are anxious to be put in touch with sources of supply. In some instances we have brought inquirer and manufacturer together, but in all cases it would pay other manufacturers to follow up the clues here given. We shall be glad to furnish the full name and address of any inquirer to producers or distributors who write us for this information. Readers of the journal on their part are earnestly requested to send us a description of their wants: we are anxious to make this department as valuable as possible to them all.

A New Store with a Doctor's Office in the Rear.

28. The K. Pharmacy writes: "We are going to have a new store building erected and would like to have some plans submitted for an up-to-date establishment with a doctor's office in the rear. We want two show windows with double doors in front, and we shall carry about \$5000 worth of stock. Can you refer this request to some firm that can make good plans for us and fit us out properly?"

Correspondence Course in Pharmacy with a Degree.

29. C. E. M. asks where he can take a correspondence course in pharmacy that will give him a degree—Ph.G., Ph.C., or P.D. He is already registered, but he wants to brush up on his pharmacy and to get a title.

Linoleum for a Store.

30. G. S. is in need of some linoleum for his drug store floor, which is presumably pretty liberal in size. He would like to be put in touch with houses where a good price could be secured on this material.

Scales for Customers to Weigh Themselves On.

31. V. W. E. thinks he would like to install scales in his store which his customers could use for the purpose of weighing themselves. He would like to know where such an outfit could be purchased to advantage. He has in mind a scale that is also provided with a sliding rod employed to measure a person's height, so that both height and weight could be gotten from the same instrument.

Agents for "606."

32. G. W. C. wants to know where Ehrlich's "606," otherwise known as Salvarsan, can be purchased. We may say that we have had several inquiries of this sort and have always replied that the American agents for this remarkable chemical are Victor Koechl & Co., 122 Hudson Street, New York City. It was first announced that the product would be put on the American market by the first of November, but the date was afterwards changed to the first of January. If in fact it is not yet available, it doubtless will be quite soon. Information concerning it can be secured from the Koechl firm, and in the meantime we call attention to the fact that an editorial and a contributed article on the subject appear in this issue of the BULLETIN.

Container for a Corn Cure: The Manufacturers of Santal Midy.

33. V. DeP. Q. announced last month in this department that he wanted something in the way of a container for a liquid corn remedy in which a camel's-hair brush was attached to the cork. P. J. Nolan of Ottawa, Canada, offers the information that he puts up a salicylic acid and collodion corn cure which is one of his leading sellers. He gets 25 cents for it. The container is a half-ounce green bottle with a glass spatula attached to the cork, and the bottle is encased in a carton. The packages are purchased from Rougier Freres of Montreal, Canada, at \$3.50 a hundred. Mr. Nolan says that he has used the camel's-hair brush attachment, but that it has decided disadvantages. The brush gets unwieldy and dirty. The glass rod idea, on the other hand, is very satisfactory.

Mr. Nolan also volunteers the information that Santal Midy is a French preparation put up by Grimault & Co., Rue Vivienne, Paris, France, and it can be purchased from any of the wholesalers. The price in Canada is \$9.50 a dozen less 5 per cent for 30 days. We had already given this information direct to E. K. H., but it will do no harm to repeat it on this occasion for the benefit of other readers.

QUERIES.

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

A Quince-seed Lotion.

W. C. H. writes us as follows: "I prepare a hand lotion which I got out of an old copy of the BULLETIN. It makes a very nice preparation, but I have always had a good deal of trouble in preparing it, especially in getting the quince-seed mixture strained well. What is the best way to prepare and strain the quince-seed? The directions say 'steep the quince-seed in boiling water,' of which the formula calls for 5 pints; then it says dissolve the borax, etc., in the balance of the boiling water. Now what do you do—use all the boiling water for the quince-seed or only part of it? What is meant by 'steeping' the quince-seed? I take it that it means placing it on a slow fire and keeping it well heated, but in this case I find that it turns brown. Is it not better to place the seed in the boiling water and then let it stand for three or four hours? How would you suggest straining the quince-seed mixture so as to get it perfectly clear? I have tried running it through cloth, cotton, etc., but without success.

"If you know of a similar formula, but one that could be more easily prepared, please advise me."

Your trouble may be due to the quince-seed. It is probably dirty. Wash the seeds two or three minutes in cold water. That will remove the dust, which otherwise will pass through the strainer and spoil the decoction. Next dissolve the boric acid in the cold water and pour the solution on the seed and let the mixture stand over night. Warm water is apt to induce fermentation. In the morning strain through a bolting cloth of about 100 meshes. Then add the glycerin, perfume, and alcohol which may be needed.

Jacob J. Franz makes a toilet lotion containing quince-seed which he calls "cream of roses." It is used on rough skin, chapped hands, etc.:

Quince seed	3 ounces.
Alcohol	16 ounces.
Carbolic acid	10 grains.
Oil of rose20 minims.
Boric acid	1 ounce.
Glycerin	4 ounces.
Distilled water, to make.....	8 gallons.

In the water dissolve the boric acid, carbolic acid, and glycerin. Macerate the quince seed in this mixture for 24 hours. Strain the cream through fine muslin several times. Dissolve the oil of rose in the alcohol and mix in the rest of the mixture. Add 15 drops of carmine solution.

Put up the mixture in 2-ounce packages and retail for 25 cents.

To Prevent Frosting and Steaming of Windows.

H. E. L.—Frosting of windows is best prevented by some system whereby cold air circulates near the glass. When the construction of the window does not permit open-

ings to be made at its top and bottom into the outer air, holes should be bored through the floor of the window. Under these holes a box should be built with openings into the cellar. In the box should be placed an electric fan so set as to create a current of cold air along the window glass when in action.

Frosting and steaming may to some extent be prevented with the following mixture applied to the glass:

Soft soap.....	2 pounds av.
Glycerin	1 pound av.
Oil of turpentine.....	sufficient.

Melt the soft soap in the glycerin with the aid of a gentle heat, and add enough oil of turpentine to give the mixture the consistency of a heavy syrup.

This should be applied to the entire inner surface of the glass by using cloths saturated with it. A thin film should be left on the glass, and rubbed off and renewed as needed.

Another plan is to apply diluted alcohol containing 5 to 10 per cent of glycerin. This will prevent steaming and subsequent frosting of show windows.

Baking Powder.

H. H. E. writes as follows: "Please supply me with the formula of tartaric acid baking powder. There are such products on the market. I desire particularly to find out the amount of tartaric acid needed to take the place of potassium bitartrate in the so-called pure baking powders."

M. J. Jones, of Rochester, N. Y., writing in *The Apothecary*, offers a formula which in his opinion produces the best baking powder that can be made. He says that it conforms with the pure food laws and equals any high-price powder in the world:

Pure grape cream of tartar.....	3 pounds.
Sodium bicarbonate (baking soda)....	1½ pounds.
Corn-starch	1½ pounds.
Tartaric acid	1 ounce.

Use two teaspoonfuls to one quart of flour.

It costs 15 cents a pound to make the powder and it sells for 35 cents.

If you insist on a formula without cream of tartar, we submit the following:

Tartaric acid	18 ounces.
Sodium bicarbonate.....	20 ounces.
Ground rice.....	2 or 3 pounds.

Cream of tartar is better than tartaric acid, and we prefer the first formula for that reason. Powders containing cream of tartar keep longer. Secondly, in the dough they evolve carbonic-acid gas more slowly and steadily than tartaric acid powder. The first point is one to which compounders of baking powders should pay particular attention, for although they may provide the cook with an article which is beyond praise when made, as soon as the box or packet is opened moisture is absorbed, the contents deteriorate, and by the time the last is used little carbonate is left.

Dissolving Rubber.

A. H. R.—How can I make a solution of rubber which will adhere to articles dipped in it?

To dissolve india-rubber or gutta-percha in chloroform or benzole is usually attended with so many difficulties and drawbacks that in nine cases out of ten, says the *British*

Journal of Photography, where the solution is required the experimentalist usually purchases it ready made. But there need be no difficulty about the matter. First, pure rubber should be obtained. When vulcanized, it is perfectly insoluble. Secondly, pure solvents are necessary. Chloroform containing a large excess of alcohol and water will fail to act even upon the purest rubber. Again, under the most satisfactory conditions, the action is very slow, and the amount of rubber capable of being taken up is proportionately very small. The plan usually adopted is to place a large amount of shredded rubber in a bottle, which is then filled up with the solvent, and shaken at intervals a few times; and when the threads do not dissolve like pieces of sugar the whole is thrown aside, and we are written to for an explanation of the failure. If a small quantity of rubber had been placed in the bottle, and the liquid added, it would have been observed gradually to swell out very considerably after the lapse of some time, and a mixture of the whole would be facilitated by stirring with a glass rod or a splinter of wood. The rapidity with which the rubber absorbs the solvent will depend upon its condition; but the action is never very quick, nor is it in any way analogous to the dissolution of a crystal.

One cause of the failure of chloroform to act upon the caoutchouc may arise from the presence of alcohol in too great a proportion. Chloroform as sold almost always contains alcohol in small quantity, owing to the fact that when none is present it cannot be prevented from decomposing spontaneously, more especially in the light. It is, however, stated that when entirely protected from light absolute chloroform will not undergo any change.

Invisible Ink.

B. R.—Invisible or sympathetic inks are fluids used for writing purposes, the characters made with them being invisible, but becoming visible upon the application of heat or of some suitable reagent. Writing made with those inks which becomes visible upon the application of heat, again becomes invisible upon cooling; on the contrary, writing developed by chemical action remains permanent. Here are three formulas:

- | | |
|--------------------------|---------------------------|
| (1) Cobalt chloride..... | 150 grains. |
| Glycerin | $\frac{1}{2}$ fluidrachm. |
| Water | 3 fluidounces. |

Mix and dissolve the ingredients.

The characters traced with this ink become blue on gently heating the paper.

- | | |
|-----------------------|----------------|
| (2) Linseed oil..... | 25 minims. |
| Water of ammonia..... | 1 fluidounce. |
| Water | 5 fluidounces. |

To make the writing or the drawing appear which has been made upon paper with the ink, it is sufficient to dip it into water. On drying the traces disappear again, and reappear on each succeeding immersion. The mixture must be agitated each time before the pen is dipped into it, as a little of the oil may separate and float on top, which would, of course, leave an oily stain upon the paper.

(3) Write with tincture of iron chloride, diluted with 10 parts of water, and develop with a blotter moistened with a solution of tannin or decoction of nutgalls or strong tea. This may be reversed by writing with a decoction of nutgalls and developing with the blotter moistened with tincture of iron. The characters when developed are black. Instead of using nutgalls to develop the iron, potassium, or ammonium, sulphocyanide solution may be employed. The writing will then appear red.

Mirror Silvering.

H. A. L.—Mirror silvering is sometimes a misnomer, inasmuch as the coating applied to glass in the manufacture of mirrors does not always contain silver. In formula 1 it is an amalgam of mercury and tin.

1. A sheet of pure tin-foil, slightly larger than the glass plate to be silvered, is spread evenly on a perfectly plane stone table having a raised edge, and is well cleaned from all dust and impurity. The foil must be free from the slightest flaw or crack. The tin is next covered uniformly to a depth of one-eighth of an inch with mercury, preference being given by some to that containing a small proportion of tin from a previous operation. The glass plate, freed from all dust or grease, and repolished if necessary, is then carefully slid over the mercury. This part of the work requires skill and experience to exclude all air bubbles, and even the best workmen are not successful every time. If there is a single bubble or scratch the operation must be repeated and the tin-foil is lost—not a small expense for large sizes. When this step has been satisfactorily accomplished the remainder is easy. The glass plate is loaded with heavy weights to press out the excess of mercury, which is collected and is used again. After twenty-four hours the mirror is lifted from the table and placed on edge against a wall, where it is left to drain well.

This formula is of course taken from the literature. We submit it for what it may be worth, for the subject is somewhat without our province.

Floor Oils.

J. W. L.—So-called "floor oils" are various oily mixtures, such as the following:

1. Neatsfoot, cottonseed, and yellow paraffin oils, each equal parts.
2. Paraffin oil, 8 parts; kerosene and lime-water, each equal parts.
3. Fish oil, 8 parts; paraffin oil and lime-water, each 1 part.

These are to be brushed on the floor, or they may be applied occasionally by means of a mop. They are supposed to prevent the dust from rising.

While these mixtures when applied to floors naturally prevent, to an extent, dust from rising, they have some ob-

A GROUP OF PARKE-DAVIS MEN.—This picture was snapped at the Dallas meeting of the National Wholesale Druggists' Association in November, and we are reproducing it through the courtesy of the *Southern Pharmaceutical Journal*. All five men are from the house of Parke, Davis & Co. Reading from the left they are: S. G. Steiner, Manager of the New Orleans branch; J. S. McCauley, Texas traveler; Ernest G. Swift, General Manager; B. A. Parsons, Manager of the Kansas City branch, and Harry Skillman, Advertising Manager.

jectionable qualities. Nos. 2 and 3, for example, have the odor of kerosene and fish oil. The greasiness or non-drying property is also objectionable, as this may do damage to rugs, carpets, clothing, etc. The customary way of oiling floors is to apply boiled linseed, preferably mixed with some of the turpentine or japan dryer. This dries to a tough, resinous coating without any greasiness. Another method of oiling floors is with a solution of wax in oil of turpentine.

Free Iodine Liberated.

R. S. T. writes us as follows: "Kindly criticize the following prescription. What is the best method of overcoming the incompatibility between the potassium iodide and spirit of nitrous ether? If dispensed as it stands would the separation of iodine be injurious to the patient?"

Solution of ammonium acetate.....1 ounce.
Spirit of nitrous ether.....4 drachms.
Potassium iodide.....25 grains.
Syrup of squill.....1 ounce.
Syrup of tolu, enough to make.....4 ounces.

Sig.: 1 drachm every two hours.

The spirit of nitrous ether is generally acid in reaction, and when an acid solution of nitrous ether is brought in contact with potassium iodide, iodine is liberated and the gas, nitric oxide, is formed. This prescription should not be filled on account of the free iodine formed.

The Acetylene Generator on an Auto.

C. W. T. submits an interesting query. He writes: "I have had several requests from automobile owners for my opinion as to the advisability of using alcohol in an acetylene generator. I do not believe it is the proper thing, but I desire to ask your advice on the subject."

Evidently our friend's customers have reasoned that since a mixture of water and alcohol does not freeze in the radiator of an automobile, it would be equally advisable to use alcohol and calcium carbide in the gas generator—an erroneous inference. Alcohol cannot be employed to generate acetylene gas from calcium carbide. A saturated salt solution is said to work, although we have never tried it. Water is of course the thing usually employed to generate the gas, the reaction being represented by the following equation: CaC_2 plus H_2O equals C_2H_2 plus CaO . In a generator the water is kept separately from the carbide and added only as the gas is consumed. Alcohol will not supplant the water, because it will not cause the same chemical reaction.

Blue-black Ink.

S. B.—The following formula is from the *Pharmaceutical Journal*:

Gallic acid 60 grains.
Ferrous sulphate 100 grains.
Diluted sulphuric acid..... 4 drachms.
Gum arabic 200 grains.
Liquefied phenol 30 minims.
Glycerin 140 minims.
Phenol blue, FFF..... 16 grains.
Distilled water, enough to make..... 20 ounces.

Dissolve the ferrous sulphate, gum arabic, liquefied phenol, glycerin, and diluted sulphuric acid in 8 ounces of the distilled water, without heat. Then dissolve the gallic acid in 5 ounces of the distilled water with the aid of a gentle heat; continue the heating until the liquid

just begins to boil, and add to it gradually the solution containing the ferrous sulphate, etc., shaking after each addition. Make up to the required volume (20 fluidounces) with distilled water, filter, and add the phenol blue, shaking until it is dissolved.

For use in fountain pens the gallic acid may be increased to 80 grains, the ferrous sulphate to 120 grains, and the phenol blue to 20 grains, and the gum arabic reduced to 160 grains.

Foaming Hair Tonic.

G. P. H. wants the formula of a foaming hair tonic.

The following preparation is said to be satisfactory. Suppose you use it, adding to the mixture enough fluidextract of soap-tree bark to obtain the foaming property desired:

Resorcin 2 drachms.
Tincture of cantharides..... 4 drachms.
Castor oil 1 drachm.
Spirit lavender compound..... 4 drachms.
Glycerin 4 drachms.
Best imported bay rum, enough to make.... 1 pint.

Separate the hair with the fingers, morning and night, and rub about a teaspoonful into the scalp. It will not harm the hair, but the medication does its work on the scalp, and an endeavor should be made to apply it there. After about a week the hair will become unpleasantly oily. When this occurs, wash the hair well with the white of an egg, followed by soap and warm water, and finally by plain water. Repeat the washing as often as the hair becomes oily, and the dandruff will soon disappear.

After a few weeks' use the preparation may be discontinued, and the cure will usually be complete. But if there is any sign of a return of the trouble, an application once or twice a week will keep the dandruff in permanent subjection.

An Elixir of Iron, Quinine and Strychnine.

M. J. B. writes: "Will you please give the proper method of compounding the following formula to make a clear mixture? It precipitates:"

Quinine sulphate..... 1 drachm.
Strychnine sulphate..... 1 grain.
Tincture iron chloride..... 5 drachms.
Diluted phosphoric acid..... 2 ounces.
Syrup of lemon, enough to make..... 6 ounces.

Dissolve the quinine sulphate in the diluted phosphoric acid. Dissolve the strychnine sulphate in this solution; add the tincture of iron chloride and enough syrup of citric acid to make 6 ounces.

Colors for Mouth-washes.

L. A. N.—Here are some coloring agents for mouth-washes. They are suggested by the *National Druggist*:

Bright red.....tincture of cochineal.
Reddish-brown.....tincture of cudbear.
Brown.....caramel solution.
Golden yellow.....tincture of saffron.
Green.....chlorophyl solution.

Naphthol Ointment.

E. D. D. writes: "I have a prescription for 2 ounces of betanaphthol ointment. How many grains of betanaphthol should I use per ounce, and what base?"

Naphthol ointment (Kaposi's ointment) is made as follows:

Betanaphthol 60 grains.
Lard 1 ounce.

Mix.

GENERAL ESSAYS.

PUNISHING THE INNOCENT.

BY HARRY B. MASON.

Few people believe any longer in Adam and Eve and their Garden of Eden. First the doctrine of evolution, next the science of geology, and finally the actual discoveries of archeologists indicated beyond question that the world had its beginning millions of years before Adam and his consort were supposed to have been suddenly created for the purpose of starting civilization on its long journey down through the ages.

But while the Eden incident is now recognized as purely legendary, the fundamental thought which it represents still clings to us with a grip that is almost fatalistic. I refer to the Fall of Man theory—the doctrine that because “the first man” and “the first woman” sinned, their descendants unto the farthest generation shall also by a species of cruel vicariousness be considered sinners until they have purged themselves of their awful heritage. In other words, they are deemed guilty until they have proved themselves innocent, and the burden of proof rests heavily upon them.

Every thinking man discards such a notion with contempt and indifference, and fortunately our theological creeds are placing less and less emphasis upon it. But after all this absurd and perverted kind of reasoning seems to be characteristic of human nature. It is instinctive. It is inherent. It will persist long after logicians and philosophers have proved the utter unreason and injustice of it.

Modern manifestations of this type of imitative mob logic abound on every hand. The sins of one man are held to be the sins of other men. The crimes of a small minority are unconsciously believed to be the crimes of the great majority. The offenses committed by a few representatives of a class are assumed to be the general offenses of the class as a whole. Everywhere the many are punished for the sins of the few.

Let us glance at instances familiar to all of us:

A few negroes assault white women, and the whole race is at once deemed to be composed of rapists and criminals and is hunted down with hungry and savage vengeance. A few Russian Jews are suspected of crimes against children, and at once a Kishenev massacre breaks out and sickens the whole civilized world with its horrible brutalities. A Chinaman in New York perpetrates an awful murder, and with one voice the country declares that all Chinamen are a disgrace to civilization and should be driven out of the country. A few druggists do a shameful and illegitimate business in liquor and narcotics, and the belief becomes widespread that all druggists are nothing but saloon-keepers and “dope” sellers in disguise. A few physicians lower their noble calling to the dust, and some one writes a book entitled “Medical Graft and Crime” charging the whole profession with an equal measure of guilt. A few married men violate the law of marital fidelity, and the world declares that no man can be wholly trusted and that every man must entirely abstain from even pure companionship with other

women than his own wife under penalty of bringing himself and them under suspicion and even disgrace.

An indefinite number of similar cases might be cited—but why pile evidence upon evidence? It might be pointed out, for instance, that all stage folk are deemed to lack virtue because some of them stray from the straight and narrow path, and that all politicians are considered crooked because a minority indulge openly or secretly in graft and plunder.

But why, I repeat, multiply instances of this sort? They abound on every hand. They are familiar to all of us. And they prove the statement that everywhere and always, in the public mind, the sins of the few are visited upon the heads of the many. On all sides we are surrounded by artificial barriers and conventions; our liberty is interfered with; our inherent right to independence of action and even thought is denied us—and all for the reason that an illogical, unthinking and suspicious world cannot trust us and deems us all sinners because a few of us are. Men of independence, conscious of their own rectitude and dignity, may refuse, and I think should refuse, to recognize these barriers and conventions. Such men may compel the world into silence by sheer force of character, but after all they are taking chances, and too often, like the lion trainer, they are caught off their guard and attacked fatally before any chance is afforded to defend themselves.

The difficulty is that the fundamental principle alike of American law and human justice, namely, that a man or a class of men shall be considered innocent until proved guilty, is flouted by society itself, and there is set up in its place the cruel and unjust principle that every man, every woman, every class, every race must be under suspicion until proof to the contrary is overwhelming and utterly impossible of doubt. Few people think for themselves about it—they simply follow the majority like a lot of animals. Those with powers of independent thinking refuse to be coerced, but nearly all of us rush pell mell after the crowd, apparently deeming it a crime to do our own thinking and use our own brains.

I am an optimist. I know the world is getting better and broader generation by generation. But I am sometimes forced to the conviction that we have a long road to travel yet before we reach the goal of perfection set up by the evolutionary philosophers. Every day we are proving the soundness of Darwin's theory regarding our common ancestry, and many centuries will yet elapse before the characteristics of the imitative monkey are refined out of our systems.

How Lamro, a thriving town in the Rosebud country, South Dakota, was recently moved across the prairies to Winner, is told by Mary Isabel Brush in *Harper's Weekly*. “More than fifty substantial buildings, some of them as large as fifty by ninety feet, were dragged across the prairie, among this number being a bank and a hotel and about one hundred private residences. Seventy-two horses were used to move the hotel, and two steam-engines were used for others of the buildings. The transplanting of Lamro is said to be the most pretentious piece of work of the kind ever attempted.”

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., FEBRUARY, 1911.

No. 2.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	-	-	-	\$1.00 per year
Foreign countries,	-	-	-	1.50 per year

FOREIGN OFFICES:

378 ST. PAUL STREET,	-	-	LONDON, ENG.
19 AND 20 GREAT PULTENEY STREET, W.,	-	-	SYDNEY, N. S. W., AUSTRALIA.
125 YORK STREET,	-	-	

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY.

THE FOSTER ANTI-NARCOTIC BILL.

Of chief interest last month was the Foster anti-narcotic bill before the National Congress. All branches of the drug trade were considerably worried over this measure. It is practically a duplicate of the Cullom bill introduced in the Senate last year, and its purpose is to put all narcotics on a revenue basis.

The narcotics involved would be opium, morphine, coca leaves, cocaine, alpha- and beta-eucaine, chloral, cannabis, and their salts, derivatives and preparations. Importers, manufacturers, and wholesalers would pay a tax of \$10 a year, and retailers a tax of \$1. In addition to this all classes of deal-

ers would be bonded and would be made to keep detailed records of all transactions. An internal revenue tax of five cents a pound or fraction would be imposed on opium, chloral and cannabis, and one cent a pound or fraction on coca leaves, and stamps indicating the payment of this tax would be affixed to and canceled on every package.

Convictions under this law would mean a fine of not less than \$500 nor more than \$5000, or an imprisonment of not less than one year or more than five years, or both, at the discretion of the court.

* * *

GRAVE OBJEC- TIONS TO IT.

It would seem that practically all of the interests in the drug trade were opposed to the Foster bill except the Legislative Committee of the N. A. R. D., the chairman of which, Mr. Richardson, was, at least earlier in the month, in favor of it. Retailers in general protest that they would be subjected to an annual tax of \$1 and an annual bonding fee of \$6 or \$8; that they would have to be subjected to the very great inconvenience of affixing stamps on every package or prescription containing the least quantity of any of the narcotics; that even things like paregoric or a corn cure containing cannabis would be involved; that the record of sales would be an enormous burden; that the red tape would be incalculable; and that all of this would result in very little benefit to the public.

The manufacturers and jobbers protest, on their part, that the law would tie them up with restrictions even more onerous in character, and that the penalty for an unintentional violation of the statute would subject them to a fine out of all proportion to the offense. Thus, for instance, since sales are restricted absolutely to tax-paid and bonded dealers, the jobber who unwittingly sold a narcotic to any druggist who had not qualified would be open to prosecution. At the hearing last month the jobbers asked that the bill be greatly simplified and that

for the present it be confined, if not to cocaine, at least to two or three narcotics, until it can be seen from experience how the revenue system works out.

It must be understood that the sole purpose of the Foster bill is to provide a system of tracing the sales of narcotics in order that the facts may be available when the violation of State anti-narcotic laws is suspected. It is primarily a detective measure. A singular thing about the bill is that no provision is made at all for the sale of narcotics to any one but the several classes of bonded dealers. The only ultimate consumers who may purchase the drugs are public hospitals and scientific institutions. Not even physicians' prescriptions are exempted, or for that matter physicians themselves.

How the druggist would be permitted to dispense narcotics at all is a mystery, for it must be realized that this is a *revenue* measure, not an interstate commerce act, and that it therefore extends its jurisdiction to *every* sale of a narcotic wherever made, regardless of whether or not the sale is completed entirely within the borders of any sovereign State. In this respect the measure is entirely different from the food and drugs act, which affects interstate operations only.

* * *

A FRIENDLY SUIT.

An interesting situation has arisen in Pennsylvania. In that State the food and drug law is the practical duplicate of the national act. The Board of Pharmacy, however, in the enforcement of the law, has drawn up regulations which in some particulars go beyond the national regulations, and which the manufacturing houses deem to be unwarranted by the law itself. The board desires, for instance, that labels shall contain detailed statements which are not required by the government or by the other States, and which the manufacturers declare would necessitate the preparation of particular labels for Pennsylvania, and would cause great confusion and annoyance without any compensating benefit.

Fortunately, however, the Board of Pharmacy and the manufacturers have gotten together agreeably and have decided to conduct a "friendly suit" to test the legality of the Board's rulings and regulations. In accordance with this arrangement Parke, Davis & Co. and Sharp & Dohme have authorized their local agents in Philadelphia to sell packages of certain products to the Board, and suit has been brought. If the court holds that the

Board has gone beyond its powers and has in effect sought to enact new legislation, the manufacturers will be exempted from trouble in the future. If, on the other hand, the court supports the Board there will be nothing for the manufacturers to do but to subject themselves to the expense and inconvenience of preparing special labels for the State of Pennsylvania.

The erroneous inference has crept into some of the reports that the action brought by the Board involves the character of the medicaments sold by the two houses, but this is entirely false and unjust. No suggestion of adulteration is involved at all. It is merely a technical question of labeling—merely a question of whether the Board or the manufacturer is right in the interpretation of the law. In this rapidly developing era of food and drug legislation it is important that agreement be reached on technical details so that all concerned will know exactly what the laws mean. For this reason decisions on a number of moot points cannot be rendered any too soon to clarify the atmosphere.

* * *

CO-OPERATIVE ADVERTISING.

An advertising method evolved by the Chicago Retail Druggists' Association has attracted considerable interest. The association is running a series of ads. in one of the Chicago daily papers, after which the matter is reprinted on counter wrapping paper and used by the members of the association in their stores. For the most part, if not altogether, the advertisements are in the form of solid text matter, and they take up and explain various features of the retail drug business in such manner that the pharmacist is set right before the public. Thus the scheme resolves itself into a sort of educational campaign, and the benefits are perpetuated by the system of having the same ads. used afterwards by the individual druggists. In this way the cost for each member of the association is very slight, and the wrapping paper is furnished for little more than the plain material would cost.

It would appear, however, from the report of the Executive Board, read at the recent annual meeting of the C. R. D. A., that while everybody has united in eulogizing the plan, the members themselves have not taken sufficient advantage of it. The chairman of the board, C. P. Crowley, declared that "unless the druggists take hold and place these reprints in their stores I shall oppose the continuance of the

work." Mr. Crowley added: "In my opinion you have a great opportunity here if you will avail yourselves of it."

* * *

H₂O₂ IN GENERAL STORES.

The Kansas State Pharmacy Board proposes to begin warfare on department stores in the large towns of Kansas which sell chemicals and patent medicines without employing registered pharmacists.

The first test case will come probably in Lawrence on peroxide of hydrogen. Mr. Dick, of that place, representing the Pharmacy Board, submitted the matter to the attorney-general and got an opinion that it was a violation of law for any one but a registered pharmacist to sell that chemical. Most of the department stores handle the article, and the attorney-general authorized Mr. Dick to arrest some storekeeper to make a test. He felt sure the Board would be upheld by the courts.

"We propose to make the department stores either hire registered pharmacists to handle their chemicals, patent medicines and drugs, or else quit selling them," said Dick. "The law requires a pharmacist to have four years' experience in order to equip himself. Now, after he does go to that expense, he should be protected. And the State Board will do it."

This effort to limit the sale of hydrogen peroxide to registered pharmacists may possibly succeed in Kansas, but it is quite significant that the same issue has just been decided in the courts of New York State adversely to this contention. There the courts have decided that hydrogen peroxide in original packages is not a drug within the meaning of the law, and that it can therefore be sold by general dealers.

* * *

FOOD AND DRUG CASES IN 1910.

That the national government has been pretty busy in the enforcement of the food and drugs act appears from the annual report of Secretary Wilson. During 1910 no fewer than 990 cases were reported to the attorney-general—766 as the basis for criminal action, and 224 for seizure proceedings. Up to the close of the year there had been 246 convictions, while verdicts for the defendants had been rendered in only three cases.

Still more impressive is the statement that samples of importations of foods and drugs were examined to the number of 95,482. That only about

3000 of these specimens were found to be illegal indicates that considerable good work has been done at the ports of entry in forcing an improvement in the character of importations. At the present time laboratories are in operation at 21 ports of entry.

* * *

A RECENT CONVICTION.

Constant reminders of the government enforcement of the food and drugs act are the "Notices of Judgment" which are issued in batches of a dozen or fifteen with surprising frequency. They pour into the BULLETIN office in far greater numbers than we can possibly comment upon, but we may say that among the recent cases which have attracted most attention are those against the Munyon Co.

Prof. E. A. Ruddiman, of Nashville, well known to pharmacists, testified in the Munyon cases that he found little else but sugar in some of the Munyon remedies, and the government argued that under the circumstances it constituted misbranding to claim for these preparations that they were "cures" of certain ailments. The company pleaded guilty, and the maximum fine of \$200 was imposed on each of the three bills of indictment—\$600 in all.

* * *

THE INSECTICIDE LAW.

The national insecticide act became effective on the first of January, and regulations for its enforcement have been issued at Washington. The government has evidently profited by its experience with the food and drugs act and has succeeded in having embodied in this new measure some of the features absent from the other one. Thus, for instance, the term "label" is so defined as to include any circulars that may be packed with the article. Again, if the contents are stated in terms of weight or measure, they must be correctly stated—a provision which Congressman Mann, it may be said parenthetically, is now endeavoring to have incorporated in the food and drugs act as an amendment.

Under this insecticide law Paris green will be considered adulterated if it does not contain at least 50 per cent of arsenious oxide. It must not, however, contain arsenic in water-soluble forms equivalent to more than 3½ per cent of arsenious oxide, and no substance may be mixed with it to lower its strength. Lead arsenic will be considered adul-

terated if it contains more than 50 per cent of water, or if its total arsenic content is equivalent to less than $12\frac{1}{2}$ per cent of arsenious oxide. Standards are established for other insecticides, but we fear they are not of sufficient practical interest to our readers to warrant mentioning them at length.

* * *

SALVARSAN DISCUSSED.

It is gratifying to note that pharmaceutical associations here and there are exhibiting a lively interest in the subject of Salvarsan or "606." Thus we find that the Chicago and Philadelphia branches of the A. Ph. A. have recently had symposiums on this remarkable remedy, and we might add that in no way can professional pharmacists better commend themselves to the medical profession than by making a close scientific study of new developments of this kind. The BULLETIN, for its part, has sought to assist in the educational process as quickly and as successfully as possible. We have had several editorials and pharmaceutical notes on Salvarsan. Last month we published an excellent article by Mr. Dunning, entering into the practical details of the subject, and a further contribution from Mr. Dunning will be found in our department of "Letters" in this issue of the BULLETIN. The preparation of the Salvarsan solutions is attended with a good deal of care and difficulty, and Mr. Dunning's articles are the best that we have yet seen on the subject.

* * *

WANTED: AN EDITOR!

The death of Professor Hallberg has thrown into more or less confusion the plan of the A. Ph. A. to begin in July the publication of the "Journal of the A. Ph. A." to succeed the present "Bulletin." The importance is keenly realized of securing an editorial successor to Professor Hallberg who shall in every particular measure up to the requirements, and there seems to be a sentiment that the new venture ought not to be launched until after the annual meeting in Boston next August. This recommendation has been made by a committee of the Washington city branch, and it has been canvassed also by the Philadelphia branch. It is understood that there are several candidates for the position, and the conservative heads want to put off action until the association at large can express itself, or at least until there can be a meeting of the full Council at the Boston meeting. Incidentally,

we are glad to see from all this that the occupation of pharmaceutical editorship is highly appreciated. Thanks, gentlemen!

* * *

AS TO "SHORTER" HOURS.

One of the subjects which will always be talked about in the drug business is that of shorter hours. Every once in a while the clerks initiate a campaign of reform, and of course there is always very much to be said for their side of the case. We have expressed ourselves on the subject with considerable frequency, but on this occasion what we desire to do is simply to reprint a schedule of working hours which a druggist in Louisville has been using for several years for the guidance of his clerk. It was contributed to a recent issue of the *American Druggist* and is as follows:

"LOUISVILLE'S" SCHEDULE OF WORKING HOURS.

Day of month.	No. hours clerk on.	No. hours clerk off.	No. hours clerk at meals.	What part of day off.
1	10	4	1	6 P.M. to morning.
2	13		2	2 meal hours.
3	5	10		12 A.M. to next morning.
4	13		2	2 meal hours.
5	10	4	1	6 P.M. to next morning.
6	9	6		12 A.M. to 6 P.M.
7	13		2	2 meal hours.
8	10	4	1	6 P.M. to next morning.
9	13		2	2 meal hours.
10	10	5		7 A.M. to 12 M.
11	9	6		12 A.M. to 6 P.M.
12	10	4	1	6 P.M. to next morning.
13	13		2	2 meal hours.
14	9	6		12 A.M. to 6 P.M.
15	10	4	1	6 P.M. to next morning.
16	13		2	2 meal hours.
17	5	10		12 A.M. to next morning.
18	13		2	2 meal hours.
19	10	4	1	6 P.M. to next morning.
20	9	6		12 A.M. to 6 P.M.
21	13		2	2 meal hours.
22	10	4	1	6 P.M. to next morning.
23	13		2	2 meal hours.
24	10	5		7 A.M. to 12 M.
25	9	6		12 A.M. to 6 P.M.
26	10	4	1	6 P.M. to next morning.
27	13		2	2 meal hours.
28	9	6		12 A.M. to 6 P.M.
29	10	4	1	6 P.M. to next morning.
30	13		2	2 meal hours.
31	5	10		12 A.M. to next morning.
31 days.	322	112	31	
	No. hours clerk on duty during month.	No. hours off during month.	Extra meal hours additional hours off.	No sleeping at store. No night calls.

This plan shows clerk averages about $10\frac{1}{4}$ hours per day, subtracting meal hours, making an average of $9\frac{1}{4}$ hours a day. Almost union schedule for hours.

[It should be understood that the store is open from 7 A.M. to 10 P.M., or fifteen hours every day, making the total number of hours of work for a month of thirty-one days, 465.]

* * *

HERR BODEMANN AFTER \$25,000.

Always a fighter, Herr Wilhelm Bodemann has now taken up cudgels against one of the life insurance companies. It seems that four policies were taken out with the company in 1899 and 1900, with the understanding that at a specified time he

could change the policies for any other kind written by the company. On the contrary, however, his application was denied when he notified the officials that he desired to surrender his straight life policy for a 20-year non-participating policy. Thereupon he put himself in the hands of a lawyer and brought suit against the company for \$25,000 for violation of contract. He thus seeks to recover all premiums paid to the company on three policies, together with the legal interest during the life of the policies. The proceeding is based on a decision rendered in a similar case and handed down by the Supreme Court some years ago. All of which suggests that it might pay others to look into their life insurance contracts and avoid similar trouble in the future.

* * *

THE PHARMACEUTICAL CHEMISTS.

The new Division of Pharmaceutical Chemistry of the American Chemical Society held an interesting meeting at the recent convention of the A. C. S. in Minneapolis. Prof. A. B. Stevens devoted his address as chairman for the most part to the subject of pharmacopœial standardization, and his remarks were important in view of the fact that he is chairman also of the U. S. P. Sub-Committee on Proximate Assays. Papers were read by Professor Stevens, E. R. Miller, G. H. Marsh, L. E. Sayre, F. Klein, and Edward Kremers. B. L. Murray, of Merck & Co., was elected chairman of the Division for the coming year, and A. B. Stevens and L. F. Kebler were chosen members of the Executive Committee.

* * *

U. S. P. REVISION. The work of pharmacopœial revision is apparently proceeding with a commendable rate of speed.

The Committee on "Scope" has, it would seem, not yet agreed on all substances to be "recognized," and from the first it has been understood that this would be one of the most difficult things to settle in the whole work of revision. Agreement has been reached, however, upon a number of the articles, and these are now being parceled out to the sub-committees for practical work. One or two meetings have been held in Philadelphia, and in the meantime Chairman Remington announces that Prof. W. F. Clark, of Chicago, has been elected by the General Committee to succeed Professor Hallberg as chairman of the Sub-Committee on Miscellaneous Galenicals.

THE DRUG-STORE "CHAINS."

The two big drug-store chains in the East seem to be gradually developing their holdings. The Riker-Hegeman Drug Co. will soon open a store in New Haven, Conn., and it is rumored that this concern is getting options on fifteen or twenty stores in Philadelphia. The Louis K. Liggett Co., of Boston, has, in the meantime, leased another corner store in its home city, and has organized a subordinate corporation to be known as the Hall & Lyon Co., of Boston, with a capitalization of \$150,000. The latter company is to be independent of the Hall & Lyon Co., of Providence, R. I. Out in Denver we find that the Scholtz Drug Co. has recently purchased Quinn's pharmacy and now has a chain of six establishments. Reverting to the Liggett concern, it may be reported in this connection that the United Drug Co., of which Mr. Liggett is the president, has been sued by the manufacturers of "Rex" on the ground that the trade-mark "Rex-all" is an infringement.

* * *

HONORING HALLBERG'S MEMORY.

The American Pharmaceutical Association has decided upon a unique but most practical method of paying tribute to the memory of the late C. S. N. Hallberg. It will make a systematic effort to collect sufficient money to liquidate the indebtedness of \$3500 on the Professor's home. To this end a large number of local committees have been appointed throughout the country, and subscription blanks have been furnished them. Everything will soon be ready for a vigorous campaign. All the money collected is to be turned over to the treasurer of the A. Ph. A., Dr. H. M. Whelpley, 2342 Albion Place, St. Louis, Mo. In the meantime Dr. Whelpley would be glad to receive direct contributions from any one who desires in this very helpful manner to recognize the many services rendered to American pharmacy by one of its most stalwart champions.

* * *

A SUGGESTION TO THE RICH DRUGGIST.

The *American Druggist* has an interesting editorial in a recent issue on a subject which has been touched upon several times in this journal—the endowing of schools and colleges of pharmacy. It seems that the late A. H. Hollister, the well-known pharmacist in Madison, Wis., bequeathed \$10,000 to establish a fellowship in pharmacy in the Univer-

sity of Wisconsin. Our contemporary asks the question which we have often propounded ourselves: Why do not other men of means in the drug trade leave some of their money to our struggling colleges? They need it sadly. No school or college of pharmacy can do the highest and best work on a self-supporting basis. Some of the institutions have endowments, but the only one which is really fortunate in this particular is the Massachusetts College in Boston. We hope that the well-to-do men in drug circles will bear this little suggestion in mind. They might die some day.

* * *

PRICE PROTECTION BEFORE THE SUPREME COURT. There is pending before the Supreme Court of the United States a case upon which depends much of the future of price protection in the drug trade. It is one brought by the Dr. Miles Medical Co. against John D. Park & Sons, the well-known house of jobbing cutters. Park never signed the Miles contract, but, after securing the goods by indirection, sold them at cut prices. The contention of Miles is that the contract "follows the goods." The case was argued ably on both sides last month, no less an attorney than Judge Alton B. Parker being one of the attorneys for Park. A decision may be expected before many weeks.

* * *

THE P. A. R. D. AND THE N. A. R. D. It begins to look as if the Philadelphia Association of Retail Druggists might after all be drawn back into the N. A. R. D. fold. Friends of both organizations have lately been endeavoring to bring them together, and at a recent meeting of the P. A. R. D. it seemed clear that the organization would reaffiliate with the national body at the completion of a pending "investigation." Even Charles Rehfuß, one of the original insurgents, was apparently in favor of this step.

* * *

The Chicago Retail Druggists' Association, in many respects one of the best organized local bodies in the country, held its annual meeting recently and elected B. A. C. Hoelzer president. Everything seems to be serene in Chicago except that cutting has broken out in some of the outlying districts. The association is grappling with the situation in real earnest and hopes to straighten it out soon.

The New York State Board of Pharmacy, in framing regulations for the enforcement of the new pharmacy act, has ruled among other things that every pharmacy and drug store in the State must own the latest editions of both the Pharmacopœia and the National Formulary, and that no registration certificate shall be issued until this rule has been complied with. Good!

* * *

The Missouri Board of Pharmacy is, with the help of the police department, inspecting the drug stores of St. Louis in the enforcement of the anti-narcotic law, and already has revoked the certificate of one clerk convicted of violating the statute. The board is also warning the trade that it must conform to that provision of the law regarding the employment of registered assistants.

* * *

O. R. Norris, a druggist in South Whitley, Indiana, whose articles on business subjects in the BULLETIN have been greatly appreciated, died last month very prematurely. Mr. Norris could not have been much over 30 years old. His contributions were always marked by originality and great practical usefulness, and their absence in the future will be sincerely regretted.

* * *

There must be something strikingly healthy about the drug business in St. Louis. Frederick Uhlich, proprietor of the Hyde Park drug store, recently celebrated his ninety-fifth birthday, and as for Dr. Enno Sander—well, we have long since given up the task of trying to remember how old he is.

* * *

Professor Remington has recently been spending two or three weeks in Cuba. He was entertained like a royal prince by the pharmacists of Havana, and before his departure for home he was assured that a considerable delegation would be sent to the Boston meeting of the A. Ph. A. in August.

* * *

The pharmacists of Illinois, like those of California and one or two other States, have decided to seek the enactment of a graduation prerequisite law, although in Illinois this step has for several years involved a considerable difference of opinion.

EDITORIAL.

AN INDICTMENT OF CITY BOYS.

"The boys entering the drug business to-day are not up to the old standard. By far the best boys we get are from the country pharmacy colleges. Nearly all my managers and my best men are from the country. Very few are from the large cities."

A rather sweeping indictment against the city-bred lads, don't you think? Coming from a more ordinary source, we might resent it. But a sentiment expressed by W. G. Marshall of Cleveland on the help question certainly carries weight. A proprietor who has been in the drug business for 25 years and now owns 14 stores ought to know a thing or two about the character of employees.

The city-bred man may claim that after all Cleveland is only one point on the map and that a condition observed there is not necessarily universal. He may argue, too, that in any event the question of fitness is largely a personal equation depending on the individual regardless of where or what he comes from. He may even turn to statistics which tend to show that the leaders in the commercial and professional walks of life to-day come more often from the cities than the country. He may point to J. P. Morgan in finance, to Theodore Roosevelt in statesmanship, to Hamilton W. Mabie in literature, to Joseph Choate in law, to Dr. Osler in medicine, and remind us: "Every one of them grew up in the city."

But that is beside the point. These men are not druggists. We are talking about pharmacists—not the leaders, but the great rank and file. There is no escaping the fact that such an observation expressed by a retail druggist of Mr. Marshall's experience is a sharp rebuke to the fellow from the city. It calls a halt to the metropolitan lads and says plainly: "Young man, you must change your ways if you want to be in the running with your country brothers." Cigarettes, late hours, and even more the things they signify, sap a young man's strength, deprive him of the physical stamina and the moral fiber needed to make a success of pharmacy. The retail drug business is no place for rounders.

Environment is of course an important part of any man's education. Perhaps there is something in the early training of a farmer's son that makes

him a better apprentice in a drug store. In his youth he learns a host of chores, brings in the wood from out-of-doors, carries water from the well, and milks the cows. Or perhaps he helps in the country store. Thus he receives a schooling in small tasks and grows up with some sense of responsibility.

The city boy, on the other hand, is fortunate if he be assigned to sprinkle the lawn in the summer or clean the walks in the winter. About his only charge is to be sure to turn the light out before retiring, and his good mania is usually on hand to tell him that. He is too much sheltered and doesn't learn to do things as the country lads must. Fortunately manual training is becoming more general in the public schools, and this may do much to offset the disadvantages of an urban civilization.

Our city lads are learning to work with their hands as well as their heads. Without manual training a boy's interests are likely to be personal. Mere things do not appeal to him. He demands activities that bring him in contact with people, wants to be a boss, a manager or an executive of some kind without first doing the menial duties by which such positions are won. The country lad, on the other hand, is all his life associated with things. There are not the social activities in the country to distract him. His companions are more inanimate objects, his interests impersonal, his craving for fun not so developed as to preclude concentrated thought upon the manual tasks that fall to the boy in a drug store. The consequence is he takes more naturally to drug-store duties. As for the confinement, he does not seem to chafe under it. If anything the city lad has even a keener relish for the out-of-doors. Certainly he is just as quick to find indoor work irksome. If environment stands for anything, the country lad has the advantage.

Something must be done to rid the city of the vast amount of human rubbish that accumulates there. The last census shows that there are over 50 cities in the United States with a population of 100,000 or over. More than a third of our 94,000,000 of inhabitants live in towns of 25,000 or over. In these centers of population men and women find life fuller, but whether it is more wholesome is doubtful. Fortunately there are some signs of encouragement. If our population is urbanized, it is also becoming suburbanized. Cities are increasing in area as well as population, and this tends to keep up the general level of health and hygiene.

Add to a better environment, a greater degree of

poverty, and you have another explanation for the country boy's efficiency. The city lad is more apt to have financial backing or other resources which he can fall back on should he fail in pharmacy. But with the country boy it is a case of "Make good or back to the farm"—and he knows it. This lack of means is a more important factor than we may suppose in the success of druggists and other business men.

Perhaps the reason why "boys to-day are not up to the old standard" is due to the increase of wealth in the land. The impetus to work is wanting. Carnegie thanked God for his early poverty, and to the young man about to enter pharmacy, an abstemious youth is undoubtedly an asset. Of course we are broad enough to lay down no general rules on the help question. We know that there are exceptions. We realize that as the poor are sometimes lazy and stupid, the rich are often gluttons for work, but the comparison is apt to be the other way. If the writer were running a drug store, he would be slow to hire any young man who did not owe his daily bread entirely to his daily labor. As a rule, the conscientious, feverish workers who give their best to every task, who are determined to succeed, who have learned from hard drudgery the value of money and the folly of squandering it, who hunger for work as the soldier craves the danger which is to distinguish him—they are not usually the sons of the well-to-do, the lads born with silver spoons in their mouths.

If the boys of to-day are not up to the old standard, their parents' means may be to blame. Their very money is apt to impose a handicap on the youngsters. The fond father who has wearily ascended the steep hill of poverty would indemnify himself in his children. Where he has hungered and thirsted and toiled, they shall take their ease. In the joys and delights of life, in its sunshine, its music, its gaiety, its leisure, in all the things at which he could only cast covetous glances they shall revel. The inevitable follows. Instead of bringing up his children to shun delights and live laborious days, to cultivate an austere simplicity and sincerity of life, to gird up their loins for the conflict that no human being can escape, to realize that in youth the happiness of achievement is infinitely richer and nobler than the happiness of enjoyment, he coddles and pampers them. Pleasure becomes not the spice but the diet of their lives. The labor which taxes yet develops their strength, they do

grudgingly. The self-denial which looks to a remote future for reward and joyfully exchanges the pewter of to-day for the gold of twenty years hence, is disliked.

And then we wonder why failure is the common crown of such discipline! A fine chance the children of ease stand against the Spartan athletes of poverty, trained to the last ounce, with the lust of success burning in their veins!

JNO. H.

ANOTHER LITTLE CHAT.

Last month we gave ourselves the pleasure of a chat with our readers concerning the plans we were making for the BULLETIN during 1911. We have a few more things we should like to say, and we hope you will all draw up your chairs and sit down for a few minutes. We hope and believe you will be interested.

First, about the price list in the rear of the BULLETIN—the department known as "Current Prices" beginning on advertising page 53 in this issue. Do you ever consult this? Do you find it useful to you in your business? Would you like to have us keep it? We are devoting nearly seven pages of valuable space to this list; we have always taken a great deal of pains to have it complete and well arranged; the prices are corrected every month by a man in the jobbing trade who is in close touch with the markets; but, much as we have tried to make this feature of the BULLETIN as perfect as possible, we sometimes doubt whether our readers really find it useful. Tell us honestly and frankly what you think about it. Would you advise us to abandon it and give the space to something else?

Last month we announced a new prize department to be known as "Best Soda Formulas." We offered to pay \$10 for the best formula and \$5 each for the two next best. We have had a few responses to this announcement, but not as many as we ought to have—although we are writing this before the January BULLETIN has been out very long. Let us hear from everybody with a good soda formula—something new and original. If possible we should like to announce the winners next month and print the prize formulas at that time.

In speaking of some of the new features of the BULLETIN last month we made no mention of two departments recently established in the journal. The department of "Drug Store Sketches," begun three or four months ago, has had some very read-

able stories—stories quite out of the ordinary in pharmaceutical journalism. We hope they have helped to while away a few half-hours, and we shall keep them up at least for a while. This month, for the first time, we are reprinting a contribution from another paper, but for next month we have an exceedingly clever and amusing sketch written for us by a young woman whose work began the department in November—Cleo C. Long.

As for the new department of "General Essays," printed on the last regular text page of the BULLETIN, we didn't expect to say anything about it. We are frank enough to confess that these short papers are written not so much to enlighten the pharmaceutical world as to enable the editor to get certain thoughts and notions out of his system. But somewhat to our surprise, and considerably to our pleasure, these short essays have brought us a gratifying number of very appreciative letters. Thanks, friends, thanks!

"DOPE" SELLING DRAMATIZED.

The playlet called "Dope" is now making a tour of the vaudeville houses of the country. Last month it was exhibited on the stage of one of the low-priced houses in Detroit, and we put our pride behind us and went down to see it. This "drama in one act" was written by the wealthy Chicago socialist, Joseph Medill Patterson, and it has all the earmarks of socialistic origin.

Throughout the whole twenty or thirty minutes of the play, appeal is constantly made to the prejudice of the poor against the rich, and the old theme is again developed that while the poor criminal is always hunted down, the wealthy malefactor may do what he pleases and laugh at the law. The playlet tells the story of a wretched druggist in the slums who does an illegitimate business in narcotics, but the whole thing is a horrible travesty. The druggist himself represents a "type" which couldn't be found in three drug stores in the land, and the miserable victims who come into the store one by one after their dope are exaggerations which are melodramatic in the highest degree.

The presentation is depressing in effect and fundamentally untrue in fact. To a pharmacist cherishing the ideals of his profession it is discouraging to have a thing like this exhibited in all the leading cities, and to have the impression conveyed that

dope-selling is more or less general in the drug stores of the country. Such an impression, indeed, could scarcely fail to be made by the drama.

Only the week before another play was presented in Detroit called "Alias Jimmy Valentine." It was supposed to be a true picture of prison life, but, like "Dope," it was an absurd travesty and burlesque to any one who knew the real facts. The warden was a cheap politician; the prisoners were emaciated victims of severe discipline and poor diet; and the whole atmosphere was false in the last degree. It would seem from these two instances that a certain class of playwrights have little regard for truth, and prefer to make their appeal to ignorance and prejudice. That harm is done by the false in art quite as much as by the false in life apparently doesn't trouble the consciences of such writers.

STRANGE CARELESSNESS.

A few business men of St. Louis connected with the Credit Men's Association have recently been gathering some interesting information regarding the attitude of local merchants toward their fire insurance. They took the pains to visit thirty retailers in different lines, asking each whether his property and stock of goods were sufficiently covered and what methods had been adopted, if any, to prevent the burning up of his property. It was found that only one of the thirty had been careful enough to see whether his policies were drawn to fit his risk; this merchant had gone to the expense of turning them over to his attorney for an examination. In three cases it was found that the insured were generating illuminating gas without the consent of the insurance companies and were thus vitiating their policies. In every instance, however, it was discovered that the merchants visited were glad to listen and get information.*

This illustrates again what we pointed out editorially two or three months ago in the BULLETIN, that not only druggists, but retailers in every line, are careless about the important subject of fire insurance. They do not seem to take the matter seriously at all. How they can afford to subject themselves to such chances it is rather difficult to understand. Too often a druggist carries no insurance whatsoever and suddenly finds that a fire comes along inconveniently and burns up all his earthly possessions without any chance of getting them back.

THE HALL OF FAME.

TWO MEMBERS OF THE WISCONSIN BOARD OF PHARMACY.

In the *BULLETIN* for April, 1909, we presented a group portrait of the members of the Wisconsin Board of Pharmacy. We are now showing like-

O. J. S. BOBERG.

nesses of two of these gentlemen in conventional style—Mr. O. J. S. Boberg and Mr. H. B. Allen.

H. B. ALLEN.

Mr. Allen hails from Richland Center and is president of the Board. Mr. Boberg is a successful pharmacist in Eau Claire. It is well known to stu-

dents of board conditions throughout the country that the Wisconsin Board is one of the most efficient in the United States.

LOUIS EMANUEL.

Mr. Emanuel is pretty well known throughout the country. He has for several years been one of the wheel horses of the N. A. R. D. and was for two or three years treasurer of the organization. In Pittsburg he is one of the bulwarks of the local association, and so far as the State of Pennsylvania is concerned he is now the president of the Board of Pharmacy. Mr. Emanuel at times wields a witty and caustic pen, and frequently he takes the floor to

LOUIS EMANUEL.

express his convictions in no uncertain manner. For the most part, however, he pursues the even tenor of his existence and usually presents a picture of studious and observing interest. Three or four months ago he was quite active as one of the hosts of the Pittsburg convention of the N. A. R. D.

TWO DRUGGISTS IN POLITICS.

We have had a good deal to say in the *BULLETIN* during the last few months about druggists who were candidates for public office. We are now showing a portrait of Frederick W. Mansfield, of Boston, who was made the Democratic provisional nominee for governor in Massachusetts last fall. It will be recalled that a deadlock at the State convention prevented the nomination of any candidate, and that Mr. Mansfield was unanimously

chosen to head the ticket unless and until agreement could later be reached on some one of the two or three candidates whose supporters were vigorously insisting on their nomination. Mr. Foss was later nominated and elected, Mr. Mansfield withdrawing in the meantime.

Mr. Mansfield is at present a practicing lawyer in

FREDERICK W. MANSFIELD,
Provisional candidate last fall for governor in Massachusetts.

Boston. He began life, however, as a drug clerk and was registered by the Massachusetts Board of Pharmacy in 1898. It has been stated also that he was graduated from the Massachusetts College of Pharmacy, but we are not prepared at this writing to confirm the statement. At any rate, he confined his attentions to pharmacy until, becoming quite an

orator, and gaining political popularity and influence, he decided upon the law as being under the circumstances a more congenial occupation. He stands very well with his party and is looked upon as a man of strength and promise.

Edward P. Dehner, whose portrait we are also

EDWARD P. DEHNER OF CLEVELAND.

showing this month, is another Democratic druggist in politics. Mr. Dehner is in business in Cleveland and he was candidate for County Commissioner on the Democratic ticket at the last election. His two stores are at 3403 Detroit Avenue, N. W., and W. 65th Street and Fir Avenue, and he enjoys a very profitable and successful business.

John Krause, Cleveland, Ohio,
Democratic member of the State
senate.

W. F. Blackstone, Georgetown,
Delaware, another State sen-
ator.

W. W. Albers, Wausau, Wis-
consin, still a third senator—Dem-
ocratic.

Albert W. Miller, Hartland,
Maine, representative in the State
legislature.

Four more druggist-politicians.

Starting in South Africa, we are showing here the building occupied by the pharmacy of W. Whyte in Roodepoort in the Transvaal. The structure is unique.

Here we have the interior of the Whyte pharmacy in South Africa. In the department of "Business Hints" in this issue we are showing another very interesting photograph sent in by Mr. Whyte.

Skipping over to Australia now, we present the interior of a pharmacy in Tasmania—that of Hatton & Laws in the city of Launceston. The fixtures are made of Tasmanian blackwood.

The photograph of this store in the Philippines is unfortunately not very distinct. The store is located in the town of Angelus in the Province of Luzon.

Getting back to American soil, we show here the store of the Harrington Drug Co. at 6th Avenue and Summit Street in Columbus, Ohio—quite a contrast to the others.

Still in Ohio, we illustrate in this cut the establishment of E. C. Kerker of Zanesville, of which the proprietor is presumably the gentleman standing at the left.

Drug Stores in Various Countries.

J. V. Ritschel is the proprietor of this establishment located at 761 Snelling Avenue in St. Paul, Minn. It bears evidence of prosperous custom.

This store, located in Willows, Cal., is called the "Postoffice Pharmacy," and the proprietor thus seeks to make capital of the fact that he conducts a sub-station for the government.

Mr. Cron, proprietor of this store in Somerville, N. J., had a live monkey in the left window and a placard reading "Don't monkey with that kof—take Cron's White Pine!"

The Palmetto Drug Co. in Mullins, S. C., has a prosperous establishment. W. L. Adden, Ph.G., the energetic manager of the store, is the first figure at the left.

Sorrell's Drug Co. has one of the finest stores in Hot Springs, Ark., and incidentally a large soda business is enjoyed, as may well be imagined from the picture.

This handsome establishment was equipped by the Wilmarth Show Case Company of Grand Rapids, Michigan, and its appearance ought to make it prosperous.

FOURTEEN STORES UNDER ONE HEAD.

The Remarkable Success of W. G. Marshall of Cleveland—Sales Aggregate a Million Dollars a Year—Plans Made for a Fourteen-story Building at the Entrance to the New Subway—A Branch Store to Occupy Three Floors, and the Rest Intended for Doctors' Offices—The Man Himself and His Beautiful Summer Home.

By JOHN HELFMAN.

Twenty-five years ago W. G. Marshall went to Cleveland and started in business for himself. To-day he owns 14 stores in that city which do an aggregate business of a million dollars a year and the sales are still growing!

Mr. Marshall has built up a remarkable organization. Each store manager is a graduate, so to speak, of the main establishment, where he has worked under the personal tutelage of Mr. Marshall himself and his able assistant Frank Hawkins. In that way each manager acquires a knowledge of the firm's methods. Mr. Marshall himself received his early training in the drug store of L. H. Yeomans, one of the foremost pharmacists of Canada.

A 14-STORY DRUG AND MEDICAL BUILDING.

Far from satisfying his ambition, success has only served to spur Mr. Marshall on to further efforts. At present he is contracting for the construction of a 14-story drug and medical building

The fourteen-story drug and medical building soon to be erected by Mr. Marshall at the northwest corner of the West Side Market House Square, opposite an entrance and exit of the new Cleveland subway.

that will probably be the largest of the kind in the United States. The site will be the property now occupied by the main store at the corner of Superior and Square Streets. The building now standing will be torn down, and the stock transferred temporarily to the two buildings immediately adjoining, which Mr. Marshall has purchased for the express purpose of taking care of the business while the new structure is under way. As Mr. Marshall himself explained: "I didn't care to close up shop here for a whole year. Now I have only to move next door."

Some may consider this whole undertaking rather venturesome. Perhaps it is, but Mr. Marshall is too shrewd a man to take a step like this without good reason. It happens that the new subway already approved by the voters of Cleveland will have a down-town entrance and exit on the square contiguous to Mr. Marshall's property. That alone gives the place immense possibilities. Thousands of people will land there daily, not only from the city but from the towns about, which will make the corner extremely valuable. Mr. Marshall feels he has a wonderful proposition there. The subway should increase the value of the property by \$100,000. Having obtained a 99 years' lease of the site, Mr. Marshall proposes to make the most of it.

Later he will put up another tall structure on his own property immediately adjoining the proposed 14-story building.

REAL ESTATE DEALS.

Thus Mr. Marshall's real estate dealings are becoming extensive. It has all along been his aim to own his store sites. So he has been gradually acquiring one building after another as his chain of pharmacies has developed. Recently he bought the property of the drug store now located at the corner opposite the West Side Market House with a view to occupying it when the lease of the present tenant expires—another example of his acumen in real estate deals. Directly across the street is being built the new Market House costing \$150,000.

That is bound to make the Marshall branch a valuable corner. Mr. Marshall has big hopes for his Market House Drug Store. He believes it will be second only to his West Side Pharmacy, now the biggest profit-maker in the Marshall chain.

Certainly Mr. Marshall is an opportunist with a marked acquisitive instinct, a type of man not uncommon in Cleveland. One can hardly visit that

The Marshall store at the Euclid Avenue entrance to the Taylor Arcade—one of the chain of fourteen establishments.

city of wealth without coming away with the feeling so well expressed in Thackeray's "The Child of Godsgate." "Depend upon it, there is something we do not wot in that mysterious overcoming of circumstances by great individuals; that apt and wondrous conjuncture of the hour and the man."

So far as we know Mr. Marshall's activities have always been confined to the drug business. He was one of the original stockholders in the Rexall Company and now owns considerable stock in that organization. He has a keen eye for promising locations. Not long ago he took over a grocery store which occupied two rooms at the corner of Superior and East 105th Streets. The place now stands transformed into a beautiful drug store. In a city like Cleveland where rents are high such ventures call for no little knowledge of real estate values.

Reverting to the fourteen-story structure, Mr. Marshall feels that there is need of an office building for medical men in this section of Cleveland. There is not a doctor at that end of the city. People on the west side have to pass the square and go a mile further up the other end of the town before reaching a physician's office. It is Mr. Marshall's intention therefore to devote the first three stories of the new building to his pharmacy and arrange the rest for

doctors and dentists. Compressed air, hot, cold and ice waters, electricity, and all the appliances of a physician's office will be installed.

The building will be made of white tile brick costing \$85 a thousand. Reproached for such seeming extravagance, Mr. Marshall replied: "We can rent this space for \$1.50 a square foot and nothing is too good." With the building of the subway, and people landing from all parts of Cleveland in the immediate proximity of Marshall's new store, the location will be one of the best in the country.

GATHERED MANY IDEAS ABROAD.

Many of the ideas for the new building Mr. Marshall gathered while abroad. A schooled and veteran traveler, every time he came to a new town he made it a point to visit the pharmacies. In this way he gathered a host of ideas that will be observed in constructing the new store. "Even in the small towns," said Mr. Marshall, "I sometimes receive some useful suggestion."

Several proposed features of the new building are doubtless patterned after the foreign pharmacies. A few have a distinctly Parisian flavor. There will be a manicurist in the place, and she will be located on the mezzanine balcony which runs completely

The Marshall branch at East 105th and Superior Streets—the latest one established.

around the salesroom on the first floor. Near by will be the ladies' toilet articles and perfume departments where women will be waited upon by salesladies. The telephone booths will also be located on the mezzanine floor. You see the purpose of this arrangement: On ascending the marble stairs leading to the mezzanine balcony where all these auxiliary departments are situated, one can't help

The house itself.

The Marshall family.

A beautiful view on the estate.

Iris grows liberally along the lake shore.

Mr. Marshall's son, George G., canoeing on the lake.

Another pretty view.

Views of "Rock Run Farm," Mr. Marshall's country estate some miles out of Cleveland.

getting a view of the entire establishment. Looking down on the show-cases below the customer will see here a display of candy, there an assortment of rubber goods, and yonder something else that will at once suggest a purchase. Mr. Marshall has recognized a principle in modern merchandizing that the more visible the goods, the better they sell.

There will be six big show windows on Superior Street, the cigar department being located between the middle two. There will be four entrances, two facing the square and two on Superior Street. The ground floor will be 21 feet six inches high. The top floor of the building will be devoted to vaults where the occupants may rent space for storing papers and valuables.

THE MARSHALL SYSTEM.

One may ask: "How does Mr. Marshall keep track of all his stores?" It is notorious that this Pharmaceutical Baron spends only a few hours a day in his office, where he stays just long enough to read his mail and settle the problems that come up in the business. He is never "fussed." Stout and jovial, with a smile that won't come off, he appears to be anything but a man of cares. If the foreman on his farm wants a half-hour's time to complain about one of the hands for having been too hilarious the night before, he may have it. Mr. Marshall may even open a *Cleveland Plain Dealer* to the quotations on farm produce and give the foreman a few pointers on the price of timothy or clover. The responsibilities of the work might weigh heavily on some men, but Mr. Marshall is always himself, serene and unruffled. Just outside of his office some one pinned a sign on the wall: "Ridicule is only a shower. Hoist your umbrella and let it rain."

To leave the man for a moment and return to his system: Marshall's complacency, his leisure, his opportunities for travel are explained in a single word—organization. By the system now in vogue among the Marshall pharmacies, the chief knows just what business each store is doing. On Mondays his store managers convene in the office of Mr. Hawkins to get posted on prices and other things. Here they discuss everything of importance in the work. If a man has had any altercations with a customer, Mr. Marshall hears the facts and the trouble is ironed out. But above these verbal reports coming from the managers are the business records kept in every store and submitted to Mr. Marshall at regular intervals. At present each store is showing a gratifying gain over the year

before. No doubt this is largely due to Mr. Marshall's liberal attitude toward his store managers. They get plenty of time off, good salaries, and a percentage of the earnings. With this profit-sharing scheme in vogue throughout the chain, every lieutenant in the firm is encouraged to give the business his best efforts. The buying for all the stores is done by Mr. Frank Hawkins, who has been with Mr. Marshall for 19 years.

Asked about the help question, Mr. Marshall replied: "The boys entering the business to-day are not up to the old standard. By far the best boys we get are from the country pharmacy colleges. Nearly all my managers and my best men came from the country. Very few are from the cities."

In the main pharmacy, where the branch managers receive their initial training, each clerk has special duties to perform. Every man has charge of a separate section of stock. Every day he makes a list of the goods needed in his department, checks up the shortages, and replenishes his shelves from the stock-room.

Once a year Mr. Marshall has an anniversary sale in which souvenirs are given away. A special sale is held monthly, announcements being made in the chief local newspapers. Full-page ads. are used. All this costs money, but it brings large returns, especially in the form of big mail orders.

BOOKKEEPING METHODS.

Mr. Marshall's stores are not confined to any one section of the city. They may be found on either side of the river. To keep his eye on such widespread interests would, we repeat, be a difficult task were it not for the admirable organization of the business. It is so systematized that the owner always knows the condition of each store. His bookkeeping system is probably one of the best in the country. At the end of every month he can tell the sales and profits of each store. Here, for instance, is a specimen page where invoice payments are recorded:

No.	Date.		Favor of	Am't of check.	Freight.	Disc't.	Other deductions.	Total am't of bill.	Remarks.
	Bill	Paid							
4201	3.22	4.10	B. W. & Co.	40.00	1.00	2.00	7.00 (Goods returned or broken.)	50.00	

In the specimen page here reproduced, the general convenience of the system is quite apparent. The gross amount of the bill is \$50. The freight was

Every year Mr. Marshall imports fresh bulbs from Holland. From six to a dozen are put in a pot and buried in the ground. During November or December they are taken out of the ground and put into a cold cellar. Those that are most advanced are then set below the window in the billiard-room where they remain until they are ready to bloom. "It is so easy!" remarks Mr. Marshall. "If more people knew how to raise bulbs, they would certainly enjoy it! It involves little expense and you have a beautiful display of flowers in your home the year round." The border of the lake is planted with Japanese, Siberian, Spanish and German iris, so that from early spring till late fall there are different kinds of iris blooming.

Aside from the cultivation on the farm, Mr. Marshall has taken pains to preserve 200 acres of original forest woodland. This stands unchanged. He allows no birds or animals to be shot on it.

THE MARSHALL FAMILY.

Sharing the pleasures of this place are Mrs. Marshall and the two boys. The older boy, George G. Marshall, is an athletic fellow now taking an A.B. course at Western Reserve. Later he will enter his father's business. Wentworth is the younger lad. Lovers of dogs will not permit us to omit mention of the blue-ribbon collie, a beautiful thoroughbred animal seen lying on the ground in one of the pictures.

Thus it will be seen that Mr. Marshall has found a way of escaping at frequent intervals from the cares of business. Besides spending much time at his country home, Mr. Marshall travels considerably. He not only works but has leisure to think, which may in a measure explain his success. He is not so buried in details as to have no time to plan bigger things. Yes, Marshall lives the full life—and the successful life!

THE BUYING AND SELLING OF SOAP.

A Refreshing and Interesting Article—Qualities that Count in Selecting a Brand—A Consideration of the Wrapper, Aroma, Profit, Advertising, and Other Points of Importance.

By GROVE B. BREWER.

Carefully wound in absorbent cotton and packed in the recess of a child's "treasure" box, there was found the other day a little baby—of *soap*. Seventeen years have passed since this "treasure" was packed away—a souvenir of the World's Columbian Exposition held in Chicago in 1893—and the "child" now grown to manhood pulls it forth, inhales the pleasing odor, smiles because he can't help it, and albeit loves it just as much as he did when he first deposited it in the box.

When we deal in soaps, then, brother pharmacists, we have got something of more interest to the individual than we imagine. Nine times out of ten the purchaser "loves" the soap he buys, especially if he adheres to one kind, just as did the man above.

And as one of the cleanest and most profitable side-lines that a druggist can handle, soap takes its place among the things it becomes an actual pleasure to buy and sell.

When an agent comes into my store to sell me soaps I take time to give him full consideration. First of all, his line is undoubtedly new—and I take

it for granted that this is the line we are to treat to-day, since to my mind every drug store ought to keep a supply of the standard, nationally advertised lines of soaps. By these I mean soaps that are advertised extensively in such magazines as the *Saturday Evening Post*, the *Ladies' Home Journal*, the *Delineator*, and the few greater publications that are really "national." First of all, then, let us say that this is a new line of soap and it is up to me to test it.

If cakes have been previously forwarded for trial use, I perhaps give it an immediate trial in water. It lathers freely or not; it tastes, yes, tastes of that peculiar almost almond flavor that denotes alkali, or it does not; it carries the scent of the flowers with it down to the last wafer—does it? Well, you can't tell then, but one infallible test is to cut the cake in two and then place the center of the cake to the nostrils. No amount of scent in the paper wrapper will help out here; the test is sure. And right here, let me say that outside of the advertised lines, it's the wrapper that sells the soap.

HOW THE WRAPPER SELLS THE SOAP.

If I were putting up a low-priced soap for toilet purposes, selling, say, at "3 for a quarter," I think I would lithograph my soap wrapper in every color of the rainbow, with lots of double dyed gold on top, and then—sell the soap. Of course I mean this from the consumer's point of view.

Your fair-haired lady who enters your store, nicely dressed, modest, steps up to the counter. Your clerk approaches, meanwhile studying his customer if he knows his business to determine what grade will please her and make the sale quickly. He has the whole range of possibility before him. The game to him gets interesting; but to the prospective purchaser it is solely one of buying seriously, profitably, pleasurably, quickly.

Now from just one man's experience as a druggist the consideration runs something like this: "We have an excellent scented soap here at 3 for 25 cents," begins the clerk, handing out the line that is being pushed because of its merits for quality that satisfies the customer. If your store is in the fashionable shopping district and your customer is "one of the four hundred of your city," she will say: "No, I neglected to mention I wanted Blank's Soap." The clerk: "We haven't Blank's soap, but here is an excellent soap of the same nature, recommended highly—"

But he never gets any further. Your fair lady elevates her head. "Oh, you haven't that kind. Very well, I will go elsewhere."

Some families have been known to cling to one kind of soap for years and years, perhaps something that their grandfathers and grandmothers used. If you want to please these people, your store being in their district, you must keep the goods they want.

SUITING YOUR STOCK TO THE NEIGHBORHOOD.

It has been my experience that the better class of trade almost invariably *know* what they want. They ask for it by name; buy quickly and go out. The medium class of trade, the three-for-a-quarter class, and sometimes the three-for-50-cent class, rarely know what they want. They are influenced largely by the attractiveness of the package, never buy the same kind twice, or, to be more exact, order it so many times that you know their favorite. And if your store is in the factory district, your sales at times will run to grit soaps; and in all places a small proportion of medicated soaps. If your store is in the market district or the poorer home district, what

will the good mother of six buy, who comes in to your store in "calico wrapper" attire, with two little tots clinging to her dress on opposite sides? What will she buy? Castile? Yes. Six big bars of Ivory? Yes. No fancy wrappers; no perfumed products will enter into her purchase lists, for she has to adhere to the strictest form of economy; and she does so, in spite of that present-day American spirit of extravagance which we are all more or less guilty of.

And then, too, I believe, from a somewhat superficial study, that women buy 50 per cent of the soaps sold; that more soaps are sold in the summer-time or under southern skies than in winter or in northern territories; that fancy packages sell best during the holidays; that in the better districts 50 per cent know and ask for certain kinds of soap, this fact being due to the wonderful system of educational and sales creating advertising of recent years by manufacturers of soaps. I believe further that in the product itself, the price, the quality and the elegance of the package are the determining factors that go to create a demand; and that the really high priced goods of the very best quality, advertised extensively, sell best to the floating population, travelers and theatrical people; while the highest priced lines, unadvertised as well as advertised, sell to the wealthy people and the younger members of society.

SHOULD THE DEALER ADVERTISE SOAPS?

No dealer who acquaints himself however slightly with the rules of successful retail advertising, can fail to see the immense advantage of linking his advertising with that of the manufacturer by announcing that he has the goods. The newspaper, if your store is down-town, is of course the most excellent medium for quick returns and the winning of public confidence. And yet while spending several thousands of dollars each year in advertising in the newspapers myself, I cannot help but feel that a big window display of attractive soaps makes the goods "move" surely as the sun sets. The window must be attractively arranged of course, and must be confined to a display of one kind of soap; the prices must be stated; the goods shown to the best advantage; the great spirit of "creating the desire" must be breathed into the exhibit there and on the counters containing the same goods within the store. Surely a store that increases its business each year ought to show a proportionate increase

in its soap department. If yours doesn't, study your locality, your trade, and then—advertise soap that appeals to "your people." The field is ever widening. Shaving soaps in sticks, in powder and in paste tempt buyers and tend to increase trade. More kinds are being nationally advertised as years go by—and advertising increases consumption. What is more, we druggists are beginning to see the good business sense of pushing a line that, as I figure it, pays on the average about 40 per cent gross profit.

HE BELIEVES IN SOAP.

And so, of the ten show-cases in my store I devote one to soaps. I favor window displays for

moving the goods. I believe in the attractive package. And I think that even if you do not agree with me that the buying of soap on the part of the consumer is three-quarters "love" for the product and one-quarter a matter of alkali and grease perfectly combined, that you will at least say that soap, as you know it, is a clean, profitable line to handle and is certainly not repellant as a product or as a buying or selling proposition to any one, except to the little boy who said:

"Say, fellers, I haven't washed my hands or face with SOAP for two months. Why should I? Didn't I go in swimmin' in the creek EVERY DAY this summer?"

WHAT IS SALESMANSHIP?

An Attempt to Define It—The Fallacy of Some of the Current Opinions on the Subject.

By H. F. GOODRICH,
Anoka, Minnesota.

For some months the various trade journals have been full of articles on salesmanship. Many of these preachments have been of real value to the clerk or traveling salesman and have been based upon real horse sense. Others have been of such nature that if taken without liberal doses of salt would give a man a perverted idea of salesmanship.

"The true definition of salesmanship," writes a contributor to a recent magazine,* "is the art or science of selling goods. . . . Any one can sell that which a customer wants, but it is the creating of the demand or the awakening of the interest that requires salesmanship. . . . If I wish to purchase a hat I go into a hat store. The salesman shows me a hat, tells me it is the latest style, and states the price. I pay for it and walk out. That is not salesmanship.

"If the salesman, after selling me what I have asked for, proceeds to show me other goods (canes, umbrellas, gloves, or other articles) and I buy, he has awakened in me a dominant interest, and effected a sale of goods which I had no intention of purchasing. This is salesmanship."

In other words, this writer contends that if the

man who made the sale gave his entire attention to supplying the expressed wants of his customer, he displayed no real salesmanship whatever. That appears to be the conclusion of the writer quoted.

THE OTHER SIDE OF THE QUESTION.

I believe that this is only a half truth. If the haberdasher's clerk is a real salesman, he knows not only the latest style, but his own stock. He has also studied his trade well enough to realize that a tall, thin man requires a hat of different shape from that of a more corpulent customer. He can then sell his patron a hat that yields his house a handsome profit, but at the same time pleases the customer. If he can sell him an umbrella and a pair of gloves too, so much the better, provided the customer really wants them. But, and here is the point, the intelligent help that the clerk gives his patron is the real test of his salesmanship.

Or, to take an example from our own trade, suppose that a customer comes into the store and inquires whether a well-known patent article is a good thing for a cough. Further questioning reveals the fact that the remedy is not for his own use but is to be given to the baby. The druggist, if he knows his business, will tell his customer that the

*"The Art of Salesmanship," by O. L. Ward, in the *Omaha Druggist*.

article called for, while a reliable remedy (if it is), contains too much opiate for a youngster. Then he sells him a harmless preparation for children's use. So whether the dealer has increased his net profit from the transaction or not, he has given real service to his customer. He is a salesman.

The salesman, then, must have not only a desire to boost for the house, to make sales. He must have a general knowledge that will make him a real help in serving the public.

KNOWING WHEN TO STOP.

One more thing the salesman must have. Strictly speaking it would be included under the term "tact," but the latter word is often used in a different sense. He must know when to keep still. If a haberdasher, he must know that when he has sold his

customer the hat he called for, an endeavor to sell his patron some additional things, say, gloves or an umbrella, arouses the man's resentment. If a druggist he must realize that when a customer asks for cough medicine there is danger in trying to convince the buyer that a plaster and a box of the druggist's own make cold cure are equally necessary. As likely as not the customer may be one of the magazine-instructed "No-thank-you-I-want-what-I-asked-for-Good-day" type who will leave the store in a huff, and there is lost not only a sale but a patron as well. Often the real salesman will have to show his salesmanship by simply keeping his mouth shut, and selling, pedler fashion, articles which yield little profit, realizing that some time he may be able to direct his customer's want to the distinct advantage of both.

"MY MOST EXCITING EXPERIENCE."

Tincture of Nux Vomica Dispensed for Water—Handling the Crowds that Flock into the Store in Accident Cases—A Doctor's Acumen and a Speedy Bicycle Prevent a Catastrophe.

REGAINING A POISONOUS PRESCRIPTION.

BY EDWARD H. GRIFFITHS, WINNIPEG, MANITOBA.

The town where I first saw the light of the drug business had a population of but a few hundred and was away in a country where the doctors were few and the druggist was the handy man for everybody. My employer, one of the old-school style, did a great deal of counter prescribing, and about this time had established quite an extensive business in that direction.

Among my own daily duties was that of dusting all the shelves and likewise the bottles on them, so that I soon learned the position of every bottle on the shelf. Later I came to know what each of them contained, so that if one was taken out of its place I easily knew where to put it back.

One day I was returning to work after lunch. Having now a mental picture of the store in my head, I quickly noticed on entering that the ten-ounce shelf bottle of tincture of nux vomica was nearly empty. I had filled it but a few hours before. Without even taking my hat off, I questioned my

employer about it, who was then standing behind the counter in a somewhat dreamy mood. Hardly had the words left my lips when he flew into a frenzy, quite unable to explain himself. After a moment's thinking he told me that he had filled a ten-ounce bottle of medicine for indigestion, for a young lady, and instead of adding eight ounces of water he had filled the bottle with tincture nux vomica and labeled two teaspoonfuls for a dose after meals.

As well as he could, he gave what particulars he recalled of her dress and the direction in which she went. I immediately rushed behind the counter, got a small quantity of potassium bromide and likewise the same of chloral, went out of the store and jumped on a wheel which was leaning against a lamp-post. After riding hard for about ten minutes in the given direction I overtook the woman passing through the garden gate. Grabbing the bottle from her hands, I explained that she had been given some one else's medicine, and promised to return the right one to her inside of half an hour.

When I arrived at the store with the dangerous

potion in my hand my boss heaved a sigh of relief, and his worried expression suddenly changed to a broad smile.

PUTTING AN END TO MOB RULE.

BY MAXWELL BUKOFZER, NORTH PATERSON, N. J.

It must be about fifteen years now that I have been working for Mr. K. in ——. My employer, a mild-mannered, kind-hearted German gentleman of some means, owned a beautiful, classy pharmacy at the corner of a busy avenue and a rather fashionable street. About half a block from the store the avenue shows a sudden, steep decline where, partly through the carelessness of the city officials, partly through the inattention of the car employees and the recklessness of the passengers, more or less serious trolley car accidents happened *bis sivo ter in die*. With unfailing regularity the unfortunate victims who got hurt were carried into our nice, clean store, which they mussed up with their blood and often their foul language. They were invariably followed by a mob of excited people, 90 per cent busybodies and 10 per cent loafers, who pushed in noisily, jostling each other, chock-full of silly advice, and who incidentally during the temporary anarchy stole right and left any article which came in contact with their playful fingers.

This embarrassing condition must have existed in its disagreeable monotony for many a year. But one day, while Mr. K. tended to a boy, a great big coon smashed a mirror plate in a hand-to-hand encounter with another loafer who had differed from him as to the mode of treatment of the boy's maimed toes. Mr. K. at last actually lost his temper completely, and after the habit of most of these gentle creatures who are hard to anger, got "criminally" mad. He cursed blood-curdlingly, swore that "that" settled "it," that "enough" was "plenty," and that "too much" likewise was "plenty," and exhibited a vocabulary of more such time-honored adjectives illustrative of a wrathful mind, including, I blush to say so, many repetitions of a word beginning with "d" which he had swallowed manfully for many years.

"From to-day on this blank thing stops! Hear? Never get anything but work, dirt, and expense out of these blank blank cases anyway! Hear? Rotten business all the way through! Hear? Next time some blank blank fool is carried in this blank store tell them to take him to the blank hospital! Hear? No blank bandaging, and no blank blank washing

in here! Hear? Understand? Blank, blank!" With an expression anything but blank on his face, usually so gentle, my worthy preceptor stalked away to vaporize his bitter indignation over his beloved chess-board.

The following day, Mr. K.'s day off, at about 2.30 P.M., the only too well-known rumpus outside heralded trouble. It had drizzled all day, when two husky laborers brought in an old matron, leaving two broad streaks of mud and one of blood on our clean floor, as a sort of introductory handshake. Two score of citizens followed closely and imparted their modicum of dirt, also sufficient noise to supply a foundry.

Out of the general jumble I heard the usual crisp demands to "fix the old lady up," and the usual heated argument on how it should be done. In spite of the tumultuous excitement I noticed a box of sulphur and cream of tartar lozenges disappear from its abode without a farewell address. With this the fighting spirit of my boss seemed to flow into my 19-year-old bosom, and following his order to the letter I cried in stentorian voice to them to get out. "Ain't you young buck goin' to fix up the poor old lady?" queried a heavyweight woman, whose breath and accent gave evidence of a tonic fluid racing through her veins. "No," I shouted; "my orders are to ring for the ambulance, but to do nothing myself. Moreover, all of you people will have to clear out of here at once."

Thereupon the noise increased to such an uproar that the blasted walls of Jericho must have wondered why they had ever obeyed so meek a call, and I was threatened with instant annihilation by means of misapplied brawn. Though trembling in my boots I, nevertheless, resisted and grabbed the only true friend of the pill-twirler in distress, the 28-per-cent ammonia bottle. At this critical moment two angels in the uniform of the police arrived, and spreading their wings soon cleared the atmosphere.

After the ambulance had taken away the poor old woman I found that the mob had taken away a pound bottle of expensive perfume among other minor booty. When at night my employer returned in his usual good humor, I was severely reprimanded for my lack of diplomacy in applying his command all too literally to an unfortunate representative of the weaker sex. This aroused a heated argument, which in turn led to my resignation.

This most exciting experience in my drug career

made me a wiser but still unconvinced servant of the hydra-headed monster, a crowd of free citizens.

POSSIBLY A HOLD-UP GAME.

By CHAS. F. WEYELS, BRADDOCK, PA.

A young woman came into the store and ordered fifteen cents' worth of lead-water. Upon my asking her what she wanted it for, she said her arms were poisoned and she wanted this to rub on them.

I sold it to her, but neglected to have her sign her name in the poison register, which afterwards caused me some little alarm. I discovered a little later that I had sold her solution of lead subacetate instead of the dilute solution.

I knew it would do no harm if used as the woman had indicated, so I didn't think any more about it until a well-dressed man came bounding into the store and said with a show of authority: "Are you the druggist here. Did you sell a woman lead-water a few minutes ago?"

I told him I had. He then informed me I had gotten myself into serious trouble. I naturally became a little worried. I asked what he meant, and he told me the woman had drunk the solution. He made a threat, saying that she was his wife and I'd pay the penalty. I was very much disturbed by this time, and told the man she was very foolish to have drunk it, which seemed to infuriate him all the more.

He said to me: "You won't feel so foolish when I bring an officer to escort you to jail."

He then departed as I thought to bring back my escort. One of our doctors happened in soon, and I related the incident to him and asked him what harm it would do. He said it would be assimilated very readily, thereby causing lead poisoning. I waited some time in suspense, but my accuser did not return; so I came to the conclusion he thought he might scare a little money out of me, but when I didn't seem so worried, he thought it was of no avail and dropped the subject. I have never seen the man or woman since.

AN APPRENTICE'S ERROR.

By SAM'L L. McDOWELL, CAMDEN, ALA.

Ever since I have been working in a drug store there is one custom that I have disliked. It is the habit of putting a poisonous drug by the side of a non-poisonous one of nearly the same name, like

calomel and corrosive sublimate, or paregoric and laudanum. Calomel goes by the name of hydrargyri chloridum mite, and corrosive sublimate, a very deadly poison, by the name of hydrargyri chloridum corrosivum. Paregoric is called tinctura opii camph., while laudanum is known as tinctura opii. These bottles are placed side by side. Since I have stated how our bottles stand, I may proceed to tell you of my mistake.

For nearly a week I had been staying up late at night either working or going to parties. One afternoon I was sitting about the store very sleepy when a pretty girl, Katie Jones, the girl that I had been courting at the parties, brought in a prescription from Dr. Bonner and asked me to fill it.

I took the prescription, which called for five grains of calomel and five of soda. Not thinking much about what I was doing, I went behind the counter, got a bottle which I thought was calomel, and measured out five grains with which I mixed five grains of soda. This I divided into powders and wrote the directions: "One powder to be taken at six, seven and eight to-night." I wrapped them up and handed the package to Katie.

After I gave the package to her she talked a little about the party, then left for home. In about an hour Dr. Bonner, my boss, came in and asked me whether I had fixed the prescription he sent me by Katie. I told him that I had. Then he walked behind the prescription counter, but came back in a hurry with a bottle in his hand.

"Have you been selling corrosive sublimate to anybody," he asked.

"No," I replied.

Then he asked, "What have you been doing with this bottle?" I looked at the bottle and realized that instead of calomel I had put in five grains of the deadly poison, corrosive sublimate, in the powders.

I didn't say a word to Dr. Bonner. I just glanced at the clock, seeing that it was five minutes to six, and jumped on my bicycle. Mrs. Jones, Katie's mother, lived about a mile out of town. I was determined to get to her house before six o'clock and prevent Katie from taking the medicine. I pedaled with all my might, but it seemed to me that my wheel would only creep along.

After what seemed to me at least half an hour I came in sight of Mrs. Jones's house. I did not take my eyes off it, but pedaled harder than ever. The first thing I knew I heard a crash, and my wheel dashed into a stump, throwing me over the

handle bars. I did not stop to see if my wheel was broken, but jumped up and ran on to the house as hard as I could. I rushed up the steps and nearly knocked the door down before anybody could open it. After a few seconds Mrs. Jones opened the door and started to say something, but before she could open her mouth I holloed: "Has Katie taken her medicine yet?"

She told me that Katie hadn't taken it, but was going to do so in a few minutes. Then I knew that I must cover up my mistake or I would lose my job and our store would lose a great deal of trade.

I checked myself and tried to act cool. I told her to tell Katie that Dr. Bonner had requested her not to take that medicine, that he had decided to change it and give her another kind.

Mrs. Jones asked me why I had been in such a

hurry. I told her that Dr. Bonner had bet me a pound of candy that I could not get there in time to keep Katie from taking the medicine. She laughed at this, and told me that I would have to give her and Katie half of the candy.

I asked her to give me the powders, and after I got them I started on back to the store. When I reached my bicycle I found that it was not injured the least bit. I got on it and rode on back to town.

After telling Dr. Bonner how I had stopped the medicine from being taken, and how I covered up my mistake, he did not get very mad but said that it would teach me a lesson in the future, and I can truthfully say that it did. As long as I live, I may make other mistakes in a drug store, but I will never mistake the poisonous corrosive sublimate for the common household drug, calomel.

DON'T BE A WASTEFUL DRUG CLERK.

**The Need of Economy in the Drug Store, with a Few Illustrations of Wasteful Practices—Written by
an Officer of a Clerks' Organization.**

**By CHAS. H. BOWERSOX,
Columbus, Ohio.***

The clerk who practices economy in the store in which he is employed possesses a quality that is highly appreciated by his employer. Furthermore, the clerk who shows an inclination to be saving usually receives better compensation for his services.

Some men give little or no thought to their employer's welfare; and the matter of checking or avoiding loss or waste seemingly never enters their minds; or if it does, it is not sufficiently manifest, for they fail to grasp the opportunity to remove a possible doubt.

I call to mind a clerk who was wasteful to an extent that caused the other clerks in the store to wonder why the proprietor did not dismiss him. Apparently he never realized that it required money to conduct a business; for he had a habit of throwing away or destroying much that would prove useful in the future. In wrapping goods he would sometimes tear off the paper reel a portion too

small for his purpose, when he would invariably destroy it.

One day he accidentally broke a jar containing potassium bromide. It did not occur to him that it could be used in making an elixir of that salt, for he gathered it up on the dustpan and threw it away.

On another occasion he unintentionally mixed some distilled water with a known portion of alcohol, whereupon he thoughtlessly consigned the mixture to the sink. One would think that the idea of using the diluted alcohol in making some of the various tinctures would have occurred to him.

I have cited just a few of the numerous instances of thoughtlessness and ill judgment displayed by this clerk. But these few are sufficient to illustrate a general class of wasteful practices. Prudence and disposition to save should occupy a high place in the mind of every clerk. He should give the matter of saving for others as much thought and attention as he would if he were in business for himself, and he should ever bear in mind the old maxim, "A dollar saved is a dollar made."

*A paper read before the Executive Board of the National Association of Pharmacologists in Columbus, Ohio, and especially contributed to the BULLETIN.

DRUG-STORE SKETCHES.

ANDREW AND IMOGENE.

BY ROY FULKERSON.

"Well," remarked Imogene, "I see that Dr. Wiley is talking again."

Andrew rose from his chair, and said in a deep voice: "Mr. President, I move to strike out the word 'again' and insert in lieu thereof the word 'yet.'" He sat down and stuck his thumb in the arm-hole of his vest.

"Motion lost," remarked Imogene. "He is talking to the point this time. He is getting after the drug stores for their methods of doing business, and I believe he is right. It strikes me they are very unaccommodating!"

"Drug stores unaccommodating?" Andrew fairly yelled. "For the love of heaven, dear lady, where do you expect to find any one in this world of gum boils, stone bruises, and gas bills who will be as accommodating as your mother or the drug store on the corner?"

"Well, ours is not accommodating, anyway," she replied spiritedly. "I 'phoned over this morning and asked the druggist if he wouldn't send word in to Mrs. Simkins, two doors above there, and ask her to give me her recipe for making chili sauce, and then 'phone it to me, and the saucy thing said he didn't have time to send, but he would look in the Pharmacopœia and see if there was a recipe for it there. Dr. Wiley says that everything which has no therapeutic effect should be eliminated from the Pharmacopœia, too!"

"Well," said Andrew, "the Doc can tell you all about the therapeutic effect of chili sauce when combined with frankfurters and beer! He is an authority on everything from the age of whisky to the penalty for splitting openers without announcing it, and is always willing to express his opinion! He has a stock of opinions equaled only by the King's Palace stock of football players!"

"Why," said Imogene, "do they sell football players?"

"Nope," said Andrew, "they raise 'em! But what about this drug-store business? You have not proved your case."

"Well, they are not nice, that's all. I buy lots of little things at their store, and I think they might at least have carried the message for me."

"Well, maybe you are right, dear," said Andrew a little mollified. "What have you bought at the drug store this week?"

"Well, let me see," said Imogene, counting on her fingers, "I bought 10 cents' worth of postage stamps there Monday, and Tuesday I bought—let me see—no, I didn't buy anything Tuesday, I only went over to look at the directory; but Wednesday I bought a jar of vaselin and used their 'phone, and it is one of those stingy ones that you have to drop a nickel in, and Thursday I got a lemon phosphate, and Friday I 'phoned and they sent me a package of cough drops!"

"Dear, there is little doubt but what that man is getting rich off of this family!" Andrew wrinkled the corners of his eyes. "No wonder he has an automobile."

"I don't care, you can laugh if you want to!" She was getting angry. "But I know they are unaccommodating! Mrs. Adams bought a box of pills there for Willie, and she only used six out of the dozen the doctor ordered, and they absolutely refused to exchange the other six for ice-cream cones! Willie took them over when he was well again. You know yourself, that all the stores exchange things now if you don't use them!"

"The mean thing," laughed Andrew, "he could have sold them if he had put a sign in his window, 'Six slightly used pills for sale at a reduction.'"

"I know another case, too, where they were not nice," persisted Imogene. "A friend of mine has a dachshund, and it seemed sick one morning, and she 'phoned over and told the druggist that Lena hadn't eaten anything all day, and asked what to do, and he 'plioned back that she better put an ice-bag at her feet and send for the doctor. But the dog wouldn't stand on the ice-bag at all, and she always believed he knew she wouldn't!"

"I guess you are right," said Andrew, "and I'm not going to vote for a single druggist for director of the Chamber of Commerce."

"Are some of them candidates?" inquired Imogene.

"I don't know," said Andrew, "but every one else is."—*Washington Times*.

MORRISON: "I bet the man who ran his auto over Snodgrass is sorry."

HARRISON: "Why do you think so?"

MORRISON: "Snodgrass was wearing a scarf-pin that punctured the fellow's tire."—*Chicago News*.

BOARD QUESTIONS ANSWERED.

AN INDIANA EXAMINATION. PHARMACY.

(Continued from January BULLETIN.)

13. Criticize the following prescriptions:

R (a) Morph. Sulph.gr. ii.
Potass. Cyanide.....gr. ss.
Syr. Toluq. s. ad \mathfrak{z} iv.

M. Sig.: \mathfrak{z} i every 3 or 4 hours.

(Write directions in English.)

R (b) Strych. Sulph.gr. ii.
Ac. Arsenios.gr. iv.
Ferrum Reduct.gr. xxiv.

M. ft. Pil. No. xxiv.

Sig.: Unum ter in die post cibum.

(a) Potassium cyanide precipitates morphine usually as the free alkaloid, due to the alkalinity of the potassium salt, although some may say that morphine cyanide is precipitated. The last teaspoonful might contain a dangerous dose. One teaspoonful (1 drachm) every three or four hours.

(b) There is too much arsenic in the pill. The dose of arsenous acid is 1/60 to 1/20 grain. Here 1/6 grain is contained in each pill, which is too much for any one not habituated to arsenic.

[Having just received a copy of the new edition of Caspari's Treatise on Pharmacy, we have largely used that excellent book in compiling this instalment of Board Questions Answered.]

AN ILLINOIS EXAMINATION. CHEMISTRY.

1. State the official forms of ammonia; percentage strength of each, and U. S. P. process of determining them. Give at least two methods for preparing ammonia. State its properties and chemical formula.

Ammonia water and stronger ammonia water. The former contains 10 per cent, by weight, of gaseous ammonia, the latter 28. To assay, introduce into a stoppered weighing bottle 3 Cc. of ammonia water and weigh accurately. Dilute with 50 Cc. of distilled water and titrate with normal sulphuric acid V. S., using litmus or methyl-orange T. S. as an indicator. Multiply the number of Cc. of the normal sulphuric acid V. S. consumed by 1.693, and divide this product by the weight of the ammonia water taken. The quotient represents the percentage of ammonia gas. Ammonia is obtained

in the manufacture of illuminating gas by the destructive distillation process: coal is heated in retorts, and most of the nitrogen contained in the coal is converted into and liberated as ammonia gas, which is absorbed in water, through which the gas is made to pass. Another method of obtaining ammonia is through decomposition of ammonium salts by the hydroxides of sodium, potassium or calcium. Usually ammonium chloride is mixed with calcium hydroxide and heated, when calcium chloride, water and ammonia are formed. Ammonia, NH_3 , is a colorless gas of a very pungent odor, an alkaline taste, and a strong alkaline reaction. In pure oxygen it burns, forming water and free nitrogen. By the mere application of seven atmospheres pressure or by intense cold (-40°C.) ammonia may be converted into a liquid which at -80°C. forms a solid crystalline mass. Dissolved in water ammonia forms ammonium hydroxide NH_4OH , the trivalent nitrogen becoming five valent.

2. Define compound radicals and illustrate or explain how they may be monovalent, divalent, etc.

A compound radical is an unsaturated group of atoms known to enter as a whole into different compounds, but having no separate existence. For instance: The bivalent oxygen combines with two atoms of the univalent hydrogen, forming the saturated compound H_2O , water. If we take from this H_2O one atom of H, there is left the group of atoms HO consisting of an atom of oxygen in which but one point of attraction is actually saturated, the second one not being provided for.

This group, HO, is a radical or residue which enters into many compounds.

According to the number of points of attraction left unprovided for in a radical, we distinguish univalent, bivalent, trivalent and quadrivalent radicals. Carbon is a quadrivalent element forming with the univalent hydrogen the saturated compound CH_4 . By removal of one-, two- or three-hydrogen atoms the radicals CH_3' , CH_2'' and CH''' are formed.

3. Write the chemical formula for the following: Blue vitriol; copperas; saltpetre; salammuniac; litharge.

$\text{CuSO}_4 + 5\text{H}_2\text{O}$; $\text{FeSO}_4 + 7\text{H}_2\text{O}$ in an impure state; KNO_3 ; NH_4Cl ; PbO .

4. Describe sodium benzoate and give method of preparation. (a) For what purpose is this product frequently used? (b) How would you detect its presence?

A white, amorphous, granular or crystalline pow-

der; odorless and having a sweetish astringent taste. Add to 10 parts of benzoic acid suspended in 20 parts of hot water, gradually, 7 parts of sodium bicarbonate. After the evolution of carbon dioxide has ceased, neutralize the liquid exactly by the addition of a little benzoic acid, or if necessary with sodium bicarbonate. Filter and evaporate with frequent stirring until the residue weighs between $13\frac{1}{2}$ and 14 parts. As the salt separates, it creeps up on the sides of the dish, and should therefore be frequently scraped off and returned to the liquid portion. When sufficiently concentrated the mass is stirred until cold, when the remaining water will evaporate. The yield is $13\frac{1}{4}$ parts. This salt being very efflorescent, the U. S. Pharmacopœia requires it to be anhydrous, for which purpose the above solution is evaporated to dryness when the yield is $11\frac{1}{2}$ parts. (a) As a preservative for canned goods, catsup, etc. (b) If the benzoic acid is present in foreign matter it is first extracted with ether. The ferric chloride test consists of neutralizing with ammonia and adding a neutral ferric chloride. A flesh-colored precipitate of ferric benzoate is produced. The color is very characteristic if the solution being tested is colorless. Then there is the sublimation process of evaporating the ether solution on a watch-glass, placing another over it. This is heated on a steam bath. If benzoic acid is present, it will sublime in crystals which can be identified by the melting point.

5. Give two methods of reducing ferric salts to the ferrous state. Illustrate by equation.

Ferric salts are reduced to ferrous by H_2S . They are also reduced by SO_2 and by being heated with iron or zinc:

6. Define (a) basic salts; (b) double salts. Give example of each with chemical formula.

(a) Basic salts are salts containing a higher proportion of a base than is necessary for the formation of a normal salt. Instances are basic mercuric sulphate $\text{HgSO}_4(\text{HgO})_2$, basic lead nitrate $\text{Pb(NO}_3)_2 \cdot \text{Pb(OH)}_2$. According to modern views, basic salts are looked upon as derived from bases by replacement of part of their hydrogen by acid radicals. In the base lead hydroxide Pb(OH)_2 , one of the hydrogen atoms may be replaced by the radical of nitric acid, when basic lead nitrate,

$\text{PbNO}_3 \cdot \text{OH}$, is formed. In bismuth hydroxide, Bi(OH)_3 , one, or two, or three hydroxyls may be replaced by nitric acid when the salts $\text{BiNO}_3 \cdot (\text{OH})_2$, $\text{Bi(NO}_3)_2 \cdot \text{OH}$ and $\text{Bi(NO}_3)_3$ are formed. The first two compounds are basic salts, while the third one is the normal salt. (b) Double salts are salts formed by replacement of hydrogen in an acid by more than one metal. For instance: Potassium sodium sulphate, KNaSO_4 .

7. Explain the reaction and show by equation the product formed when a solution of bismuth in nitric acid is added to water.

By dissolving metallic bismuth in nitric acid, a solution of bismuth nitrate is obtained, nitric oxide escaping — $\text{Bi} + 4\text{HNO}_3 = \text{Bi(NO}_3)_3 + \text{NO} + 2\text{H}_2\text{O}$.

If the solution be poured into a large quantity of water, the salt is decomposed with the formation of bismuthyl nitrate (bismuth subnitrate) and nitric acid, which latter keeps in solution some bismuth — $\text{Bi(NO}_3)_3 + 2\text{H}_2\text{O} = \text{BiONO}_3 \cdot \text{H}_2\text{O} + 2\text{HNO}_3$.

8. How are the following affected by exposure to the air: Potassium carbonate; zinc chloride; sodium sulphate; lime-water and ammonium carbonate? (a) Are the changes which take place in any of these chemical changes?

Potassium carbonate deliquesces, absorbs moisture, forming a colorless or yellowish liquid of an oily appearance. Zinc chloride absorbs moisture. Sodium sulphate crystals effloresce or lose their water of crystallization, leaving a white powder. Lime-water becomes covered with a pellicle of calcium carbonate. Ammonium carbonate parts with ammonia and carbon dioxide, becomes opaque, and yields a white powder of acid ammonium carbonate. (a) Yes, the last two.

9. What is "iron by hydrogen?" Describe method of preparation and show equation.

Ferrum reductum. Ferric hydroxide is made by precipitating a solution of ferric sulphate with ammonia water as directed in the Pharmacopœia. The hydroxide is dried and then introduced into an iron tube and heated to dull redness in a current of hydrogen gas, which is freed from acid vapors and other products by passing through a solution of potassium permanganate, basic lead acetate, and sulphuric acid. After hydrogen ceases to be absorbed, the reduced iron is allowed to cool in the hydrogen to prevent reoxidation, and is then preserved in dry-stoppered bottles. The reaction is $\text{Fe}_2\text{O}_3 + 6\text{H} = \text{Fe}_2 + 3\text{H}_2\text{O}$.

(To be continued.)

SELECTIONS.

THE RETAILER AND HIS CREDIT.

In an address delivered by S. D. Rider, vice-president of the South Bend Watch Company, before the last convention of the National Association of Retail Jewelers, several matters were discussed which retail merchants in every line should give special consideration if they are to approach business success.

"Discounting all bills," said Mr. Rider, "is the open sesame to the markets of the world. And no matter how small or how large a business one is doing, if he discounts all bills, every firm from the Atlantic to the Pacific and from the Gulf of Mexico to the Lakes will be anxious to open an account with him for any reasonable amount. But I hear it said, 'My capital will not permit my discounting my bills.' To that I say, figure out how much additional capital would be required to discount all bills and how much would be saved each year by securing this capital.

"I dare say that many have never done this, but let me suggest that every retailer total up his indebtedness and see what it would cost to secure enough additional capital to make possible the discounting of all these bills. Then figure the profit which can be made by so doing and it will be found quite astonishing.

"Right here let me give an illustration of the value of discounting bills.

"Several years ago a young man of my acquaintance entered a western city and embarked in the retail business with a total cash capital of \$1500, that by frugality he had saved from his small salary. He rented a store at \$1250 per year for five years, and then proceeded to purchase as many goods as he could pay for. He also cultivated the acquaintance of the cashier of the bank where he did his business, and a few weeks after opening his store borrowed a sum of money from the bank and increased his stock.

"He had rented a large storeroom and his limited capital did not allow him to carry as large a stock as he desired, but he persisted in discounting all bills and buying closely. At the end of the first holiday season it was necessary to fill his store shelves and counters with empty boxes as his stock was cleaned out, but he was able to pay off his loan at the bank and had a surplus besides.

"The next year he borrowed a larger sum, but continued to discount his bills. Every one was anxious to sell him, for his credit was without a blemish. In a few years he had increased his stock in the original store to over \$1500 and opened several branch stores. To-day he is connected with several strong financial institutions in the city in which he resides.

"You may say, 'That sounds good, but how am I going to do it.' I say, 'Make your business fit your capital.'

"The secret of his success was that he made his business fit his capital. And this leads me to one or two axioms I desire to propound.

"First, no man should go into business unless he has a reasonable amount of money and above all be sure that he knows something about the business that he is entering into.

"Then he should buy only as many goods as he is reasonably sure that he can pay for and discount all his bills.

"Starting out with a certain capital, he should estimate the amount of business that he feels that he should be able to do monthly. Deducting from this his store and personal expenses, he should then buy only as many goods as he can reasonably expect to pay for promptly when due.

"He should keep a careful record of all goods purchased, when they are to be shipped and when he can save his discounts; then limit his purchases absolutely to the amount that he has estimated will be available for paying bills from month to month, and he is sure to win. If his sales are better than he expected, he can buy more goods. He can send in mail orders for the most profitable sellers. On the other hand if his sales are less than expected, purchases should be curtailed, but every effort should be made to stimulate his sales so that they will equal the amount estimated.

"There are also many retailers who are to-day extraordinarily successful, and this is due to the fact that they have jealously guarded their credit, while other men of equal merchandising ability have been complete failures because they have not realized the necessity of conserving their credit and have lost the confidence of those from whom they could secure the most desirable merchandise, and have finally dropped out of the race.

"One more point is very important, and that is the giving of statements to commercial agencies or

to individual inquirers. Many merchants seem to feel that they should not be expected to do this. But let me ask, how is the jobber or manufacturer going to be able to do justice in extending credit if one refuses to inform him honestly and frankly concerning his financial condition?

"Many a man who is entitled to unlimited credit is handicapped immeasurably by his refusal to make a statement to the commercial agencies and remains a small dealer all his life, when with the proper credit rating he would be entitled to purchase direct from the largest wholesalers.

"It must be remembered that a concern selling to thousands of customers cannot possibly know each one personally, but must rely on cold-blooded facts as gleaned from numerous inquiries in order to extend credit ratings intelligently.

"The entire business of this country is conducted largely upon credit or confidence; and to coöperate with organizations that make the gathering of information about credit their business should be the purpose of every retailer, as it is ultimately to his advantage to impart this knowledge to the houses that publish ratings."

A QUAIN T CUSTOMER AND A QUEER SIGN.

J. M. Brooks, of Clifton, Texas, in a paper read before the Texas Pharmaceutical Association, narrated a little experience which is indeed amusing. To quote:

As a pioneer druggist in a local option school district in a country town in '81, I had just set up a modest little business in a small wood house, which had been used, previous to my occupancy, for general merchandise, and still bore the sign on two boards tacked to the front of the building above the door, thus:

DRY GOODS
AND
GROCERIES.

There was no practical painter in the place, but an all-round, handy fellow, good for any job that offered. I asked him if he could paint me a drug sign and take the other down. He said he thought he could and was perfectly willing to try. I told him the simple word "DRUGS," on a piece of canvas, was all I wanted at present.

I furnished the cloth and the lampblack, and he painted the sign and put it up, for which I gave him a quarter and paid no further attention to it.

A day or two later I had a rather quaint customer call. He rode a long sloomy horse that bore marks of hard service. He was well seated in a deep saddle with boot toes protruding far through iron stirrups. In front were a roll of blankets, a coil of rope, a long whip, and a branding iron.

Behind were strapped a yellow slicker, coffee pot, frying pan, and tin cup. I did not look in the saddle pockets.

He wore a broad-brimmed, tall, white hat with harness leather band, a red handkerchief, colored overshirt, fringed leather leggins, boots, and belled spurs.

Riding up to the little platform in front of the door, mechanically and rather gracefully lifting his off-foot clear over the kitchen department and setting it upon the platform, and throwing the long reins over without hitching, he turned into the store. Had he not been previously observed his loose spurs with rowels jingling against the floor as he walked would have announced his entrance.

As he neared my position I asked him if there was anything I could serve him with to-day. With a mingled expression resembling a cross between a wild westerner and civilization, a look of complaisant significance with a kind of sunburnt preface, he replied, "Yes, I want about a 50-cent bottle of AND!" Not comprehending his meaning, I asked, "What is the want, please?" He said, "Some AND, AND, about a 4-bit bottle—handy for the hip pocket—now do you understand?"

I had to beg pardon again, and guessed I did not have it in stock, but proceeded to ask him how it was put up, how it looked, etc.

After pronouncing the bad place, he says: "It is put up in bottles, jugs, canteens, walking canes, pocket Bibles, powder horns, and various other ways, according to the circumstances under which you get it. It looks good, smells good, tastes good, feels good, and is good if it's a good article. Come now, hurry up, come across, I am in a hurry, I am onto my job, I can read between the lines, I have been in local option districts before—besides, no harm can come to you. There will be nobody to report it. I am passing through and will never be here again."

When I, with difficulty, finally convinced him I did not carry the article he wanted, and as he turned to leave, with a look of chagrin and disappointment, he retorted, "If you don't keep it you better take down your sign!"

When he was gone I wondered on his meaning of "take down your sign." I went out and looked on the front of the building. I found that the boy who painted my new sign had taken down the old one as instructed, but had left the part that was lettered on the house and tacked my new drug sign just above it, so my sign now read: "DRUGS AND."

THE EVIL OF LONG HOURS.

If we were asked to point out the one particular thing which does more than any other one thing to prevent the practice of pharmacy from becoming the agreeable, respectable, and fairly profitable calling that it by right ought to be, we would without hesitation name the almost universal long week-day and Sunday hours which those who follow that calling seem to find it necessary to put in.

The "theory" upon which the practice of keeping the pharmacy open at unseasonable hours and times is based is that it is necessary in order to supply medicines for the sick; but there is not a pharmacist in the entire country who does not know this to be untrue, or who would not be compelled to admit if "put to it" that all of the legitimate dispensing of drugs and medicines done by a score of average stores on Sunday and after the usual business hours on other days could be done by a single establishment without unreasonably working the employees thereof.

The theory does not fit the facts, and we should either change the practice to correspond, or get another theory.

No other calling, no matter how important to life and health, finds it necessary to prolong its hours of daily and weekly service to the extent that they are prolonged in the drug business. The theory that it is necessary for the druggist to do so is a fiction and a fraud.

The real reason why the druggist works while other people are either sleeping or recreating is partly the force of long established custom, and partly the desire to capture the trade for other things than drugs and medicines which he fears might go elsewhere if his store was not open at such times.

What follows to the bow always bent, to the spring always upon the stretch, inevitably results to the brain and nervous system always upon duty; all alike lose their elasticity, and the ability to render efficient service in the time of need.

Here and there some adventurous spirits have broken away from their bondage, but their example and unanimous testimony to the effect that they are better off financially has had but little effect upon those who are still in slavery. The latter still hold the nickels that come from soda and cigar sales so close to their optics that they cannot see the dollars that might be gained by the possession of an intellect reinvigorated and a physical system restored by the proper amount of rest and recreation.

Is it really worth while? Does it pay to give up health, family, companionship, and the joy of living in return for the meager receipts from later hours and Sunday business?

Why not give up the Sunday business and be your own man one day in seven? Why not one day in the week exchange the close smell of the drug shop for the breath of God's out of doors in the fields and parks, and have some of the life, liberty and pursuit of happiness said to be yours by the Declaration of Independence?

You will live longer, enjoy a broader horizon while living, and die both richer and happier.

If your fellow druggist cannot be persuaded to join with you, then leave him to his bondage, but don't be a slave yourself because he declines to be free.—Editorial from the *Midland Druggist*.

SELLING SOAP AT A PROFIT.

In most sections the trade in toilet and medicated soaps is so subject to competition that there remains little or no profit. For this reason druggists often overlook the importance of the soap trade, and fail to apply the means to remedy the evil.

The trade in toilet soap and more particularly the trade in medicated soap was created by the drug trade. At the present time the dry goods man, the grocer, and the fancy goods shop, and even the barber, is a competitor. In consequence of this prices are cut and quality sacrificed.

Druggists can help to overcome this adverse condition by a little well directed effort. Our suggestion would be that while the druggist should carry in stock all of the popular brands even though he may be obliged to sell them at little or no profit, he should select a few kinds that belong exclusively to the drug trade and put them in the lead. This he can do by keeping the cut-rate soaps in the back-ground, or out of sight. Then he will be able to

concentrate the attention of the customer upon the kinds which he prefers to sell.

It is, of course, imperative that the kind of soap which he shall elect to push shall be the best that can be had. It might be well here to caution druggists against any sort or kind of "name goods" brand of soap. It is well known in the soap trade that the spoiled batches of soap are reserved at the soap factory to be made over into soaps for the trade who demand goods under the buyer's name.

We also call particular attention of the druggist to a well-founded and growing prejudice against cake soaps. This prejudice against cake soap is warranted for the reason that under the stress of competition and cut prices cake soaps have been made up of poor fats, poor chemicals loaded with all sorts and kinds of stuff and fillers until they are worthless, and some of them dangerous. It has also come to be known that cake soaps are unclean, that they hold and harbor germs, skin excretions, and it is claimed that through their use disease can be transferred. Physicians now uniformly use and recommend either liquid or paste soaps.

Here seems to be a chance for druggists. They possess just the technical knowledge, and hold the ear of their patrons, and can turn this tide of prejudice to their profit. Soaps sold over the drug counter, when surrounded by a technical professional value, and provided that the soap is a quality to merit this assumption, will bring a higher price, and the customer will come back for more.—*Red Cross Messenger*.

UNWASHED FRUIT.

A danger that is too little appreciated even by many of our most intelligent and fastidious people, is unwashed fruit. In cities like New York, where so much fruit is sold on the streets from open carts and stands, the evil is increased tenfold. Apples, pears, peaches, grapes, berries and other fruits that are eaten uncooked are the chief offenders, and examinations that have been undertaken show a variety of germ life that would be astounding if the bacterial contamination liable to result from street dust was not already known. Flies are another great source of contamination.

It will be claimed by some that the organisms thus found on fruit are largely if not wholly harmless, and this is unquestionably true. But enough patho-

genic bacteria have been repeatedly demonstrated on these common articles of food, particularly when exposed to flies, to make it certain that the present danger is very real.

Many city ordinances require that all fruits—and vegetables too—be screened. This, if followed, reduces the evil somewhat, certainly in respect to flies, but little protection is afforded against dust. In spite of the utmost care, this is bound to accumulate, and with the inevitable contamination from handling, insures myriad colonies of bacteria on every piece of fruit.

All fruit, therefore, that is not cooked should be thoroughly washed. It is hard to impress children with the urgent necessity of this, and they are the ones most endangered. Realization of the constant tendency to cholera infantum, intestinal disorders, and the graver diseases like typhoid fever emphasizes the necessity of preaching, and teaching every one, from the youngest toddler up, never to carry a bit of fruit to the mouth until it has been washed—and well washed.

This is only one small detail in the general movement to eliminate or at least to reduce the possible causes of disease. To many, who recall their care-free youth and remember that they came through unscathed, though they ate anything and everything in the way of fruit, with never a thought of washing it, the foregoing may seem trivial. But there is another picture of thousands and thousands of graves of little martyrs who did not come through unscathed. Every year acute intestinal affections claim an appalling toll of children and young adults. The cases that are directly attributable to unclean fruit may be few or many. That there are any is enough to show the danger, and once shown there can be no two opinions as to the necessity for its removal.—*American Medicine*.

WHY SOAP CLEANSSES.

Some interesting details are given in *La Technique Moderne, Hospital*, concerning the researches of M. W. Spring, a Belgian chemist, into the processes whereby soap cleanses. It has been stated that the cleansing properties of soap are due to its combination with the soiling substance, but this only half explains the question how soap acts. An explanation is still required as to why it disappears after having taken up and entered into combination with

the dirt, or, in other words, why the compound is removed. The author, after studying the action of soap upon various soiling substances, such as lamp-black, clay, red chalk, silica, cellulose, etc., comes to the conclusion that the cleansing of an object consists in a process of substitution. There is brought about a colloidal combination of the soap and the soiling substance, which, by reason of its constitution, no longer has the power of fixing itself by absorption on to the solid body, with the result that it is easily carried away by the water. Thus in washing with soap one puts it in contact with one's soiling substances, these latter having a greater affinity for the former than for one's skin. The process does not end here, for soap in its turn has even a greater affinity for one's skin than for the substances, which it proceeds to replace and to set free to be taken up by the water and removed. The dirty substances have a chemical action on the fresh solution of soap and water, resulting in the formation of an acid salt, with which they agglutinate themselves. This compound of colloidal absorption is due to electrical action. The constituents have different electrical polarities. The compound is

stable and can pass through a filter-paper without soiling it.—*Practical Druggist*.

TO DESTROY THE DOMESTIC FLY.

A circular recently issued by the American Civic Association gives a number of practical hints as to the best methods of ridding houses of flies, and they deserve to be known and put to a practical use. The circular says: "Provide screens for houses and food. Keep garbage receptacles securely covered. Remove stable manure every three or four days or disinfect with lye, chloride of lime, or crude carbolic acid. To clear a room of flies heat a shovel or any similar article and drop thereon 20 drops of carbolic acid; the vapor kills the flies. A better and cheaper plan is to put a spoonful of formalin in a gill of water and expose it in the room. Another is to dissolve one drachm of bichromate of potash in two ounces of water, add a little sugar, and place the solution in shallow dishes about the rooms."

A campaign conducted on these lines will do much to rid a household of this insufferable and dangerous pest.

A NEAT CIGAR DISPLAY.—This trim appeared in the window of W. E. Sherriff, of Ellsworth, Kansas, having been set up by H. M. Curry. It consisted largely of dummies and signs sent out by the manufacturers, although a few of the placards were home-made. There is a pyramidal effect in the grouping, the base consisting of boxes while the top is made up of Tom Moore and Henry George pictures. The mechanical arrangement of the trim leaves little to be desired. In the center is a large sign devoted to Tom Moore cigars, while at the left is one on the Henry George brand. The display proved very effective.

DOLLAR IDEAS.

A WANT LIST ADJUNCT.

S. Palmer, Shreveport, La.: Every well-regulated drug store keeps a "want list." Proprietor and clerks will always (?) note shortage of items usually kept in stock. But what becomes of the numerous calls for items not usually carried in stock?

They are "passed up," but why? One may be open for business and have expenses accumulating right along; still six different clerks may each have a call for an item from as many different customers and each one fail to note it because, as he explains, "It is not in our line." Every retail store carries a vast number of side-lines having no relation to the drug business proper. Some time ago I advised the following blank form with pleasing results:

SALE LOST.	
	Date.....
Item.....	
If in stock state why the sale was lost.	
.....	
Clerk.....	

These forms I had printed and padded, and placed in convenient places. The clerks filled them out and filed them. At night I would go over them and see what my trade was demanding, and would use my judgment on the advisability of buying the things asked for.

SUCCESSFUL PLAN FOR ADVERTISING CASTILE SOAP.

C. P. Rice, Martins Ferry, Ohio: The following plan proved splendidly successful in procuring a good Castile soap trade as well as advertising and boosting the sales of our olive oil.

On a Monday we dressed our window very neatly and abundantly with eight-ounce bars of pure Castile soap and the best five-cent honeycomb washcloths we could obtain. In the center we adjusted a 14x22 inch show card appropriately worded: "Saturday Only, an Eight-ounce Bar Pure Castile Soap and a Honeycomb Wash Cloth, 10 cents." We also set up two 11x14 inch cards, one saying: "This Castile Soap is Absolutely Pure, being the Product

of Pure Olive Oil," and the other, "Remember this Offer is for Saturday Only." Our space in the local papers was occupied by the same signs.

We positively would not disturb the window for any one until Saturday morning, and by noon that day the window was ready to be redressed.

The combination cost us between nine and ten cents, but our later sales on Castile soap soon repaid us for the small profit made on our "Saturday Only" display.

During the week we had the soap display in our window we talked up olive oil at every available opportunity and continued the interest in olive oil by following the soap display with one of pint, quart and gallon packages of olive oil.

The plan enabled us to clinch the Castile soap and olive oil business of our community.

EXPLOITING BRUSHES.

W. C. Peters, New Philadelphia, Ohio: A good advertising stunt which we engineered several years ago, and which not only produced good results but made my store talked of for a week, was the following:

First we placed in our window hundreds of brushes of all sorts, hair, cloth, bath, tooth, nail, camel's-hair—in fact all the brushes in our stock. These we placed in one huge pile, with the camel's-hair brushes (about 200) in the center covered by the other brushes.

Then we inserted in different places in our daily paper the following, without any name attached thereto: "How many brushes in a brush pile?" In fact whatever part of the paper one looked, this question stared him in the face. When it appeared the second and then the third time, every one was asking, "How many brushes in a brush pile?" and "Who's running that ad?" Then on the fourth day we used large space with the following ad.: "\$5.00 in gold to the customer guessing, 'How many brushes in a brush pile.' The brush pile is in our window—see it!" Of course our name going with the last large ad. In our window we had a large card with the following: "How many brushes in this brush pile? A guess with every purchase. \$5.00 in gold to the nearest correct guess."

We closed the contest in one week, and found that our sales had increased 33½ per cent, and during the week we had sold more brushes than we had in the preceding ten.

A NEW WAY OF MAKING LIME-WATER.

F. W. E. Stedem, Philadelphia, Pa.: In cleaning up my lime-water jar recently it occurred to me that our plan of making and storing lime-water might be of interest to others; therefore this description.

Procure a twenty- or thirty-gallon stone crock. Drill a hole through the side about twelve inches above the bottom and into this aperture fasten an ordinary plumber's spigot. Shake, fill, and wash several times, drawing off the wash product by means of the spigot until all of the undesirable, soluble impurities are removed, then fill up with water, mix well, and allow the lime to subside to the bottom of the crock below the spigot. When lime-water is wanted, merely tap the spigot and draw into the dispensing bottle the quantity desired.

This method insures not only a clear water of constant saturation, but enables one to make quite an ad. of their lime-water through an occasional exhibition in the store. A peck of lime will permit of refilling the jar at least ten times.

REMOVING SCREW-CAPS OR LIDS.

Frank Green, Jr., Skidmore, Mo.: Often druggists find a screw-cap or lid which they cannot remove easily from a can or bottle. I have always found the following method works successfully:

Take a piece of strong cord long enough to loop sufficiently at both ends and wind it about one and a half times around the cap or lid, finally running one end of the cord through the loop on the other half. Turn the projecting or free end backward, having first passed a stick of wood or a bar of iron through it. The bar or stick serves as a lever which may be set against the cap or lid and turned like a wrench. If the cord slips around the cap or lid, use a little rosin on it, and this method will surely prove a success.

DISPENSING CAPSULES, TABLETS, PILLS, SUPPOSITORIES, ETC.

Frank Green, Jr., Skidmore, Mo.: I think this a good idea for dispensing capsules, tablets, pills, suppositories, etc.: After placing the required number of capsules, tablets, pills or suppositories in the box, fill the remaining space above them in the box with cotton. This prevents rattling, breaking, etc., and impresses the customer with the neatness and care of one's dispensing.

LETTERS.

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

MORE FROM MR. DUNNING ON THE PHARMACY OF "606."

To the Editors:

Since completing my article in the January BULLETIN I have improved the method of preparing for injection a

NEUTRAL SUSPENSION OF SALVARSAN.

The improvement consists in making the alkaline solution as directed under the neutral suspension method, using however a 4-ounce Erlenmeyer flask which is supported in a 4-ounce evaporating dish.

When using 0.6 "salvarsan" the alkaline solution is diluted to 100 Cc. with sterile water and filtered repeatedly through a tight pledget of sterile cotton until entirely free from extraneous matter; an extra flask having been provided to receive the filtrate. This solution is carefully neutralized in the manner previously suggested, and the resulting suspension is centrifuged as follows: A 15 Cc. graduated centrifugal tube is filled with the suspension and centrifuged until the suspended material measures not more than 3 Cc.; the supernatant fluid is pipetted off and discarded. More of the suspension is poured into the tube and the operation repeated until the amount of suspension has been reduced to about 12 Cc.; this being transferred to a beaker, the residue washed into it from the tube with a few cubic centimeters of sterile water, and the whole thoroughly mixed with a glass rod. This procedure gives by far a finer suspension than any method I have tried, and besides, the suspension is entirely free from extraneous matter. *It is, however, much more tedious than the first method suggested.*

All utensils must be carefully sterilized.

To those not possessing a centrifuge the following plan is offered: Instead of diluting the alkaline solution to 100 Cc., dilute it to 12 Cc., filter in the manner and with the precaution just described, and carefully neutralize with normal acetic acid, finishing with decinormal.

The suspension is not quite so fine as by the other method, but it is free from little specks and fibers.

I should like also to call attention to some precautions necessary to be observed in the handling of this chemical. When a vial is opened it should all be used, any remainder being discarded. The chemical readily deteriorates in contact with air. The suspensions or solutions should be almost immediately used after preparation. Within an hour or two some decomposition is noticeable.

THE ALKALINE SOLUTION METHOD.

I have recently prepared seven doses of Salvarsan by the alkaline solution method, all of which were injected into the buttocks. Compared with the pain caused by the suspension method, which I have just described, there is very much less discomfort. Besides, the method of preparation is much simpler. The method used was essentially the same as that which was published in the January issue of your journal, but on account of larger experience I am able to give some further improvements, and will therefore restate the method.

Into a wire basket, about 5 inches in length, 4 inches in width, and $5\frac{1}{2}$ inches in depth, is placed, wrapped in gauze, a 4-ounce porcelain dish, 2-ounce beaker, 2 glass rods, about 4 inches long, 1-ounce funnel, 30-Cc. conical graduate, some absorbent cotton, and small pieces of gauze, the whole being thoroughly sterilized, preferably in an autoclave. A 25-Cc. glass stop-cock burette is also sterilized. The beaker is placed in an evaporating dish, and 0.6 of Salvarsan is emptied into it; then 1.3 Cc. 4 normal sodium hydroxide is added and the mixture triturated until a perfect solution results.

Ten Cc. of sterile water are now added and mixed, the solution being filtered and refiltered through a pledget of sterile cotton contained in the funnel and into a 30-Cc. graduate, the funnel and cotton being washed with enough water to make about 12 Cc. To this solution, with constant stirring, is added, drop by drop, the decinormal sterilized acetic acid, from the sterile burette mentioned, until a slight opalescence is produced and remains permanent; about 10 Cc. of the acid will be required.

The advantage of this modification is that it insures, in the first place, a perfect solution of the Salvarsan, from which all extraneous matter is removed, and also insures a minimum degree of alkalinity and yet permits the injection of the substance in the form of a solution. This method of back neutralization is the only one which I have

seen published which will give a preparation as nearly free of alkali. It will be observed that the amount of 4 normal sodium hydroxide solution used to dissolve Salvarsan is not sufficient to form the bisodium salt, but is a little in excess of that which is required to form the monosodium salt, the excess being afterwards neutralized.

Let me say finally that there was a slight error in my article last month. Everything should be omitted in the fourth paragraph from the end except the first sentence: this matter should have been stricken out, but it evidently escaped my attention.

H. A. B. DUNNING.

Baltimore, Md.

A SOUTHERN CALL TO ARMS.

To the Editors:

Taking my own State as an example, in nearly all the examinations of the State Board of Pharmacy this question is asked: "What is Pharmacy?" and the applicant is expected to answer as follows: "Pharmacy is the *science* which treats of medicinal substances. It comprehends not only a knowledge of medicines and the art of preparing and dispensing them, but also their identification, selection, preservation, combination and analysis."

From a scientific point of view this is the proper answer, but from a general point of view it does not hold good, because I for one can prove that in many cases pharmacy is a common business operated by every Tom, Dick, and Harry. Isn't that fierce? It is fierce; it is sad to have to mention it; but it is still worse to have to admit that it is a *sound, frozen-bottom fact!* If every pharmacist were honest with himself I feel certain that he could name from ten to twelve unlawful acts. I for one can, and I can prove it.

Here is an example: Mr. Doctor comes to the conclusion that a drug store attached to his office would be very convenient, and likewise of advantage to his patients. Naturally he looks at the step merely from a philanthropic standpoint, but strange to say, after giving the matter careful consideration, he realizes that the business will not justify the paying of a registered pharmacist's salary. He is not after the profits—certainly not. It is all merely for the sake of convenience. But nevertheless he gets an "assistant pharmacist" instead of a full registered man, and even more often a man who is

not even an assistant. Now, is that not *his finish*? Am I right? Am I wrong? If I am right, then why not get busy and put a stop to it? If I am wrong, then pharmacy is not what it has been taught to be.

I wish to call attention to the fact that the present standard required by a State board examination in pharmacy directly indicates that to be a pharmacist you have to equip yourself in accordance with the answer to the question of "What is Pharmacy?" and in addition have a knowledge of chemistry, botany, materia medica, physiology, etc. Hence pharmacy is bound to be a vocation demanding respect and requiring lawful recognition. But, dear friends, cast a look around you and tell me, what is pharmacy in fact? Is it not regarded as a plain old business, or an old slot machine operated by any one who has gumption enough to start it?

I am certain that justice will be made manifest in the future, but let us make justice hurry just a little bit more! Let us join hands and uphold the standard of pharmacy. Let us see that every drug store has in it a registered and duly qualified pharmacist, and not merely his certificate, as now happens in many cases. Shall we stand by and see our chosen vocation trampled upon—abased by such unlawful and shameful acts? No! Let us see that our chosen vocation be protected as to her rights, her honor, and her standard of dignity!

J. J. DUBOURG, PH.G.

CONCERNING ETHEREAL OIL.

To the Editors:

An article giving complete information about ethereal oil would prove of interest. Until the food and drugs act of 1909 went into effect in Pennsylvania, when one ordered heavy oil of wine he paid about 50 cents for one ounce, and about half that amount for light oil. Now the Pennsylvania jobbers ask \$2.75 an ounce for heavy oil of wine, and \$2 for ethereal oil, U. S. P., which latter oil consists of heavy oil of wine 50 per cent and ether 50 per cent. At the same time most oil manufacturers sell a heavy oil of wine guaranteed under the national food and drugs act at \$5 a pound or 35 cents per ounce.

What is the difference between the heavy oil of wine which satisfies the Federal law and the much more expensive article spoken of at the beginning of this letter? Ethereal oil is described by the U. S.

Pharmacopœia as a volatile liquid containing equal volumes of heavy oil of wine and ether. The method of preparation is given, ending with a direction to add to the heavy oil produced an equal volume of ether. Why may not a druggist buy any heavy oil of wine that meets the requirements of the national act, and mix it with an equal volume of ether to obtain his ethereal oil?

The National Dispensatory states that the heavy oil contains 44 to 48 per cent of ester calculated as diethyl sulphate, and that we have no satisfactory knowledge of the other constituents.

I am informed that many druggists make Hoffmann's anodyne without any ethereal oil whatever, probably in deference to the taste of the foreigner who buys it for drinking purposes. From the amount of confusion and lack of knowledge concerning the oil on the part of druggists, doctors, and wholesale druggists, it seems to me that an article along the lines indicated would be of much interest. I know that it would to me. THOS. W. MURPHY.

Vandergrift, Penn.

THIS "LOVE POWDER" A REPEATER!

To the Editors:

I noticed a letter in the December issue of the BULLETIN from A. S. Parker asking for suggestions for a love-gaining remedy.

Let me tell my experience with a young man who was in search of a similar remedy. He was about 21 years old and appeared to me to be not quite right. When he asked for some "Love Powders" I said: "I have none prepared, but if you will give me a little time I'll fix up a box. Call in about fifteen minutes." I thereupon made a dozen powders consisting of one grain each of pepsin and sugar, with instructions to take one occasionally or as needed. The charge was 25 cents. The boy left feeling pleased, but returned in a few minutes inquiring whether a little liniment of some kind would not also be good. I sold him a 50-cent bottle of liniment.

I did not expect to see him again, but in about a year he appeared and wanted some more of those "Love Powders." I sold him another box of the same description.

If this prescription will be of any use to your readers they are welcome to it.

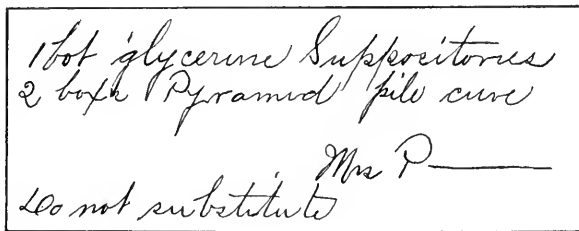

ALEX. H. FJELDSTAD, PHM.D.

Blooming Prairie, Minn.

THE SUBSTITUTING DRUGGIST AGAIN.

To the Editors:

We were much interested in the customer's order which you reproduced on page 519 of the December BULLETIN. It was an order for water of ammonia, and the customer was afraid that some awful kind of substitution would be practiced on him. An

1 bot glycerine Suppositories
 & box Pyramid pills cure
 Do not substitute Mrs P

order of a similar nature was received by us the other day, and I am sending it along to you for comparison with the other. It would seem that some of our kind friends have convinced at least a portion of the public that we druggists are a lot of substitutors.

ZIMMERMAN'S PHARMACY.

Lodi, California.

PINEAPPLE JUICE AS A VEHICLE FOR ESSENCE OF PEPSIN.

To the Editors:

In a recent issue of the *Bulletin of the A. Ph. A.*, in a report of the meeting of the Nashville branch of the A. Ph. A., mention was made of some results in the preparation of essence of pepsin. In all these experiments, wine of one kind or another was used. The writer recently made a small amount of the essence of pepsin, N. F., but used Dole's pineapple juice instead of wine.

The result was very fine, the product being just right in color and pleasant in odor and taste. Furthermore, it possessed the very decided advantage of a smaller content of alcohol. The one objection urged against pepsin preparations by physicians is the large content of alcohol, and the doctors say they use the essence or elixir of pepsin more as a vehicle than for its proteolytic effect. But if the preparation be made with pineapple juice, this objection is wiped out and the product possesses the additional value of whatever digestive power the juice itself may carry.

If any pharmacist chooses to try this experiment, the results will no doubt prove of interest to all readers of the BULLETIN.

H. P. PETTIGREW.

Sioux Falls, S. D.

THE NOMENCLATURE OF WOOD ALCOHOL.

To the Editors:

Referring to the communication from Henry P. Hynson, mentioned in the December BULLETIN in connection with the editorial, "Wood Alcohol by Another Name," let me say that the term he suggested, "Methyl Hydroxide," hardly strikes me as being all that could be desired as a new name for wood alcohol.

Would there not be danger of the term being confused by those not particularly versed in pharmaceutical nomenclature with the more universally used article Hydrogen Peroxide? "Hydroxide" and "Peroxide" to those unfamiliar with chemistry or scientific terms would have a very similar appearance in print and a certain similarity in pronunciation.

Why not call it "Wood Distillate?" No other article of common use has a title at all familiar. Neither would such a name be in any way incorrect.

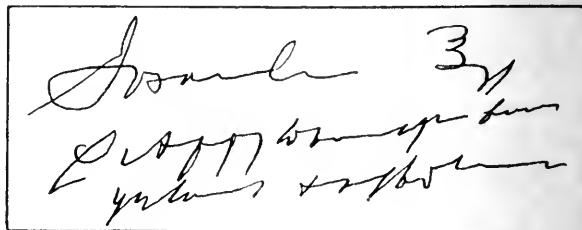

Storm Lake, Iowa.

WILBUR M. SUTTER.

A PUZZLE SOLVED.

To the Editors:

I have just noticed the cryptograph on page 519 of the December BULLETIN [reproduced herewith—

Formalin 36
 Apply to suspected sputum and otherwise

Ed.]. As a pharmaceutical cryptologist I do not consider this a very hard prescription to decipher:

R Formalin36

Sig.: Apply to suspected sputum and otherwise.

Yours for better penmanship among the learned medical profession—and it needs it sadly and badly as shown by this illustration!

Brooklyn, N. Y.

OTTO RAUBENHEIMER.

To the Editors:

I think the BULLETIN is the best that is published. Don't ever stop it, for I will pay for it.

312 BRADY STREET

a demand for Floraline Cream, which pays the owners a profit of 15 cents, but also to secure the addresses of people who use the preparation. From time to time other advertising matter of a similar nature can be sent to the people whose names are on this list.

A South African Idea—Using a Maiden for Advertising Purposes!—

Elsewhere in this issue of the BULLETIN, on page 56, we are showing exterior and interior views of the pharmacy of W. Whyte, in Roodepoort, in the Transvaal, South Africa. In this place we reproduce another picture sent in to us by Mr. Whyte. Concerning it he writes as follows:

"This picture shows a girl who went to a fancy dress ball

here a fortnight ago representing our store. Her headdress is made up with three photographs of the store, while the dress is hung all over with nipples, puffs, tooth-brushes, and labels. Her fan advertises 'Dermaline,' a skin lotion, and two tiny cakes of that soap are fixed on also. Unfortunately no prizes were awarded, but there were quite a lot of compli-

mentary remarks passed by the onlookers, and it was a novelty for these parts."

Incidentally Mr. Whyte passes on to say some very nice things about the BULLETIN: "Your journal is always of interest to me, and I pass it along to others when I have digested its monthly contents. What an improvement it is on the other journals with their dreary reports of meetings, which only furnish reading for a few of the pharmacists who happen to live in the particular towns involved!"

The Personal Letter as a Business Getter.—

R. M. Nicholson, writing in the *Practical Druggist*, dwells on the value of direct correspondence as a means of winning customers. He argues:

"Suppose for instance you are introducing a new cigar. Now is there any quicker way to get that particular cigar to the attention of the men than to write them a short, snappy letter giving them a few good reasons why they should try the new smoke? The average smoker is an experimenter. He likes to try new smokes. Your direct message to him tells him what to try.

"Take another example. Suppose you carry a line of school or college banners. Why not send a letter to the high school and college students in your town inviting them to come to your store and look over your selection. They will read your letters and appreciate your interest. Not many such letters are sent them. They are neglected by most advertisers, and it is this same neglect on the part of your competitors that will make your letter all the more forcible."

CAPSULES OF SCIENCE.

Prepared by Prof. W. L. SCOVILLE.

Knobs of Knowledge.—

Ehrlich's "606" is found to be eliminated from the body more slowly than arsenic given in other forms.

Mr. Riehl finds that taka-diastase converts twice as much starch into sugar when in the presence of hydrochloric acid as the same amount of malt diastase.

M. Madelung says that a mixture of anesthetics is much more effective than an equal amount of one anesthetic.

Terpinolene, a by-product in the manufacture of terpineol, is being used as an adulterant of essential oils. In small quantities it is very difficult to detect.

If benzoic acid be exposed to sunlight in the presence of ferric salts, it is converted into salicylic acid, says Neuberg.

E. K. Nelson says that capsicum contains about 0.14 per cent of capsaicin, and that one drop of a solution of capsaicin 1 in 1,000,000 will produce a perceptible warmth on the tongue.

E. W. Schmidt says that thymol is no good as an antiseptic or disinfectant. He has tried it on various things, and finds it innocuous.

A non-inflammable substitute for celluloid, called "Boroide," has recently been put upon the market.

Dry pancreatin is not injured by heating to 100° C., but is partially destroyed by heating at 120° for two hours.

It takes about three years to entirely eliminate radium from the system after it has been administered.

Himdin (leech extract) is stated to increase the action of mercury and to render it toxic in smaller doses than normal.

M. H. Fischer says that glaucoma is due to a chemical change in the colloids of the eye, whereby the affinity for water is increased.

T. Heryng says that if milk be heated quickly to 80° C. and cooled immediately, as by spraying, it is sterilized without injuring its enzymes. Continued heat at this temperature destroys them.

In anesthesia by chloroform, about half the chloroform administered is decomposed by the blood and tissues, according to investigations by M. Nichloux.

Some Odds and Ends.—

The tungsten incandescent light has practically displaced the carbon light in France. They make a more durable lamp there, and guarantee it against breakage.

The simplest fat, glyceryl triformate, has only recently been obtained pure. It rarely occurs in nature.

Profuse perspiration causes a considerable loss of salt from the body, which must be restored in the food.

The toadstool contains the only glucoside known to have blood-agglutinating powers, and is the first agglutinin to be isolated by chemical means.

The starch of oats is better assimilated by diabetics than any other form of starch.

D. Jonnesco says that substances which combine chemically with adrenalin in test-tubes will not so combine in the living body.

Tahiti vanillas contain less vanillin but more oleoresin than do the higher grade Mexican or Bourbon vanillas.

Moth-millers, their larvæ, and certain beetles prefer strychnine in their food and thrive on it. Two German naturalists have recently demonstrated this.

Porcelain houses are being built in the tropics. They are water-tight, insect-proof, and sanitary—a combination impossible to get in wood in hot climates.

That's What They Say.—

Drs. Short and Salisbury believe that they "have obtained definite proof that none of the drugs at present in use in the form of liniments, lotions, ointments, etc., for painting on or rubbing into the skin have any power to relieve pain. The use of belladonna, opium, aconite, menthol, cocaine for bruises, thrombosis, inflammations, neuralgia, should therefore be discontinued."

Scented, or Take it with You.—

Scholtz & Gelaine say that the disinfecting property of soap is due to the soap itself, not to free alkali which it liberates. They also say that soap increases the antiseptic properties of perfumes, and a perfumed soap is therefore more bactericidal than the non-perfumed. Carbolic acid is, however, decreased in power in soaps.

A Costly Drunk.—

Wilde finds that the amount of alcohol in $\frac{1}{4}$ to $\frac{1}{2}$ pound of the best (and strongest) brandy drops is about equal to that in a pint of beer, while in the cheaper grades from 2 to 19 pounds would have to be eaten to get the alcoholic effect of a pint of beer.

Bleachers and Unbleachers.—

Two chemists of the Kansas Board of Health have been studying the digestibility of bleached flour, and fail to find any difference between the bleached and the unbleached in respect to digestibility. They made 188 tests before they decided.

Such Actions!—

A German chemist has studied the action of senna infusion by means of Roentgen-ray photographs. He finds no action until the senna reaches the large intestine, then peristalsis is increased and evacuation of the entire colon takes place.

How it Comes Out.—

The normal fat of the skin is oleic acid, which is found most abundantly in the horny layers and the cells surrounding the sweat pores. Neutral fats and cholesterol are found in only very small amounts in skin-fats.

BOOKS.

A "WORLD CORPORATION."

A book having the foregoing title came into the BULLETIN office for review some time ago, and we have until now been vainly waiting for a period of leisure in which to give it a proper degree of consideration. We find upon inspection that it outlines a scheme of great novelty for the financial and economic amelioration of society. The author is King C. Gillette, whose portrait and personality have become familiar at least to the readers of the Gillette Safety Razor advertisements in the magazines.

The "World Corporation" is, briefly put, an organization designed for the purpose of investing in all good securities. Its own stock will be sold at a dollar a share, and as fast as capital is thus secured it will be promptly invested in listed and staple stocks and bonds of the open market. These securities, taken out of the market, would be subject no longer to speculative fluctuations, and stability would therefore be obtained. Through this purchase of stock, too, one industry after another would be brought within the control of the World Corporation, and this great organization, when it finally reached its ultimate goal, would thus have absorbed and assimilated all corporations and become the master of the world's industry and commerce. A form of socialism would be reached in which the wealth of the world would be owned coöperatively, but without the common objection to socialism that everybody would share in equal measure. Dividends would be paid on the World Corporation stock quarterly, according to one's holdings, and these would be safe, sure and beyond fluctuation and manipulation.

It is a very pretty economic dream, and it remains to be seen how well it will work out. In the meantime the "World Corporation" has actually been incorporated in Arizona and offices have been opened at 6 Beacon Street, in Boston. Mr. Gillette is the first president and treasurer of the corporation. Realizing that some great and masterful personality is needed to head the movement Mr. Gillette offers to be one of 20 individuals who shall pay Theodore Roosevelt \$25,000 each for a period of service lasting four years. This would provide our ex-president with a million dollars, and on \$250,000 a year he ought to be able to live frugally. We cannot do justice in this brief review to the scheme as a whole, and we would refer those of our readers who are interested to the book itself. The publishers are the New England News Co., of Boston, and the book sells for \$1.00.

THE MICROSCOPICAL EXAMINATION OF FOODS AND DRUGS.

This valuable book is the work of Henry George Greenish, F.I.C., F.L.S., a prominent British pharmacist. It is specially devoted to practical instruction in the methods of examining vegetable foods, drugs, and their powders. The author has selected certain typical examples and describes the ways by which they may be examined.

The subject-matter is so arranged that the student may begin with an examination of the simple substances and

proceed to the most complex, acquiring as he goes along in the work a knowledge of the various tests and operations that are more or less in general use. The author has commenced with the starches, which require but little preparation. Thence he proceeds to the fruits, which commonly possess a complex structure, and to the roots, which are hard to identify when powdered.

One chapter is devoted to the more commonly recurring adulterants of foods and drugs. While it is often true that, as soon as a novel method of sophistication has been exposed, it is abandoned, nevertheless several adulterants appear to be in more or less constant use and the author therefore brings these to the notice of the students. Finally, Professor Greenish has appended a general scheme of examination which may prove useful in the investigation of an unknown powder.

The price of the book is \$3.00 net, bound in cloth. There are 386 pages. The book is published in this country by P. Blakiston's Son & Co., Philadelphia.

ANNUAL REPORT OF THE MISSOURI BOTANICAL GARDEN.

The twenty-first annual report of the Missouri Botanical Garden for 1910, Wm. Trelease, director, has been received. This volume does not differ in dress, etc., from the earlier volumes of the series which have been reviewed in this journal. It contains 195 pages of reading matter and 32 plates. The first twenty-four pages contain the annual reports of the officers and directors. The scientific papers which make up the rest of the volume are as follows: "The Algal flora of the Missouri Botanical Garden," by Ada Hayden; "Periodicity in *Spyrogyra*," by C. H. Danforth; "The Fungous Root Tubercles of *Ceanothus Americanus*, *Elæagnus Argentea*, and *Myrica Cerifera*," by E. G. Arzberger; "Development and Nutrition of the Embryo, Seed and Carpel in the Date, *Phoenix dactylifera*, Lin.," by Francis E. Lloyd; "Illustrated Studies in the Genus *Opuntia*—III," by David Griffiths; "Abnormalities in *Oenothera*," by R. R. Gates; "Botrytis as a Parasite upon *Chrysanthemums* and *Poinsettias*," by Perley Spaulding; "Fungi of Clay Mines," by Perley Spaulding.

Mr. Griffiths describes and illustrates ten new species of *Opuntia* as a result of five years' study of the material in both field and garden.

O. A. F.

A HANDBOOK OF COSMETICS.

A very interesting little work is a "Handbook of Cosmetics" by Dr. Max Joseph of Berlin. The work has been translated, and the English version may be obtained from E. B. Treat & Co., 241-243 W. 23d Street, New York. There is a demand among doctors and druggists for a fuller or more scientific knowledge of the skin and hair, and the treatment of their minor affections. Too much of the work goes to the chiropodist, the barber, and the quack electrician. There is room for the pharmacist in cosmetics because the doctor does not make a study of these apparently trivial affections. Dr. Joseph's little book should help to disseminate some valuable information on the subject. Aside from text of a general nature it has 151 recipes for the preparation of cosmetics for the skin, hair, mouth, and nails.

QUERIES.

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Repairing Broken Glass, Porcelain, and Bric-à-Brac.

P. D. Co. asks us for a formula for making cement for china, glass, etc. The following formulas have been recommended:

1. Broken glass, china, bric-à-brac, and picture frames, not to name casts, require each a different cement, in fact several different cements. Glass may be beautifully mended to look at, but seldom so as to be safely used. For clear glass the best cement is isinglass dissolved in gin. Put two ounces of isinglass in a clean wide-mouthed bottle, add half a pint of gin, and set the mixture in the sun until the solid is dissolved. Shake well every day, and before using strain through double lawn, squeezing very gently.

Spread a white cloth over the mending table and supply it with plenty of clean linen rags, strong rubber bands, and narrow white tape, also a basin of tepid water and a clean soft towel. Wash the broken glass very clean, especially along the break, but take care not to chip it further. Wet both broken edges well with the glue, using a camel's-hair pencil. Fit the break to a nicety, then slip on rubber bands lengthwise and crosswise, every way they will hold. If they will not hold true, as upon a stemmed thing, a vase, or jug or scent bottle, string half a dozen bands of the same size and strength upon a bit of tape, and tie the tape about neck or base before beginning the gluing. After the parts are joined slip another tape through the same bands and tie it above the fracture; thus with all their strength the bands pull the break together. The bands can be used thus on casts of china—in fact, to hold anything mendable. In glass mending the greater the pressure the better, if only it stops short of the breaking point. Properly made the isinglass cement is as clear as water. When the pieces fit true one on the other the break should be hardly visible, if the pressure has been great enough to force out the tiny bubbles, which otherwise refract the light and make the line of cleavage distressingly apparent. Mended glass may be used to hold dry things—as rose leaves, sachets, violet powder, even candies and fruits. But it will not bear to have any sort of liquid left standing in it, nor to be washed beyond a quick rinsing in tepid water. In wiping always use a very soft towel, and pat the vessel dry with due regard to its infirmities.

2. The most dependable cement for china is pure white lead, ground in linseed oil, so thick it will barely spread smoothly with a knife. Given time enough to harden (some three months), it makes a seam practically indestructible. The objection to it is that it always shows in a staring white line.

3. A better cement for china is white of egg and plaster. Sift the plaster three times and tie a generous pinch of it loosely in mosquito netting. Then beat the egg until it will stick to the plaster. Have the broken egg very clean, cover both with the beaten egg, dust well with the plaster, fit together at once, tie, using rubber bands if possible, wrap loosely in very soft tissue-paper, and bury head and ears in a sand box, taking care that the break lies so that the sand will hold it together. Leave in the box twenty-four hours. After a week the superfluous plaster may be gently scraped away.

To Polish Brass.

J. M. T.—Rub the metal with rottenstone and sweet oil, then rub off with a piece of cotton flannel, and polish with soft leather. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather. A mixture of muriatic acid and alum dissolved in water imparts a golden color to brass articles that are steeped in it for a few seconds.

A brass polish may be prepared by making a paste of equal parts of sulphur and chalk, with sufficient vinegar to

reduce it to the proper consistency; apply it to the metal while moist, allow it to dry on, and rub with a chamois skin. For ornaments or engraved work, clean with a brush.

Another process, and one that gives to the brass a very brilliant color, is to make a wash of alum boiled in strong lye, in the proportion of 1 ounce alum to 1 pint lye. Wash the brass with the mixture, and afterward rub with chamois and tripoli.

A weak solution of ammonia in water makes an excellent wash. Apply it with a rag, dry with a piece of chamois, and afterward rub with a piece of chamois and a very small quantity of jewelers' rouge.

Silvering Mirrors in Spots.

J. B. R. D. C.—Clean the bare portion of the glass by rubbing it gently with fine cotton, taking care to remove any trace of dust and grease. If this cleaning be not done very carefully, defects will appear around the place repaired. With the point of a penknife cut upon the back of another looking-glass around a portion of the silvering of the required form, but a little larger. Upon it place a small drop of mercury; a drop the size of a pin's head will be sufficient for a surface equal to the size of the nail. The mercury spreads immediately, penetrates the amalgam to where it was cut off with the knife, and the required piece may be now lifted and removed to the place to be repaired. This is the most difficult part of the operation. Then press lightly the renewed portion with cotton; it hardens almost immediately, and the glass presents the same appearance.

A Mentholated Jelly of Agar-Agar.

M. P. D. Co. asks us to publish a formula for mentholated jelly containing a base of agar-agar, one which will not be too thick, be slightly perfumed and have a pink color.

Agar-agar does not make a satisfactory base for such a jelly. It is nice when fresh, but grows watery and lumpy on standing. Glycerin in small proportion does not prevent this.

From ½ to ¾ ounce of agar-agar per pint is enough, and it should be boiled three to four hours. This will make a fairly stiff jelly, perhaps "too thick." The querist should have indicated what consistency he meant by the term "too thick." We suggest the following formula, but it is only a guess:

Agar-agar	3 drachms.
Water	12 ounces.

Boil three hours, keeping up the volume of water; then strain and add:

Glycerin	1 ounce.
Menthol	1 drachm.
Camphor	15 grains.
Cologne	3 ounces.
Liquid carmine.....	a sufficient quantity.

Dissolve the menthol and camphor in the cologne, add the glycerin, then the jelly, and mix well.

Anti-freezing Solution for Automobiles.

H.'s Drug Store.—You have come to the right place to ask about an anti-freezing mixture for use in automobile radiators during the cold months. It happens that we have personally been experimenting along this line, and our ex-

perience has been that nothing will take the place of an aqueous solution of wood alcohol or denatured alcohol. Glycerin, calcium carbide, and other substances are sometimes employed, but they have disadvantages, either producing deposits or exercising a solvent effect. As for the strength of the alcoholic solution, it can be varied to suit the temperature. A 33⅓-per-cent solution will do for all ordinary purposes and is said to resist the cold pretty nearly to zero. When, however, more of the solution is poured into the radiator to take the place of that which has evaporated, the solution ought to be at least 50 per cent in strength, since the alcohol evaporates faster than the water and the mixture in the radiator therefore has a tendency to become somewhat weaker in strength. Either denatured or wood alcohol can be used, but the former is slightly preferable because less volatile.

A Cathartic Mixture.

L. D. L. asks us to print the formula of a prune pepsin compound containing rhubarb, magnesium sulphate, aloin, spices, and a small quantity of syrup of prunes and pepsin. How would this do?

Syrup of rhubarb aromatic.....	4 ounces.
Magnesium sulphate	1 ounce.
Aloin	8 grains.
Syrup of prunes.....	4 ounces.
Glycerole of pepsin.....	2 ounces.
Elixir aromatic or simple syrup.....	enough to make 16 ounces.

There is an incompatibility between the pepsin and aromatic syrup of rhubarb, the latter being alkaline. Pepsin, however, is often exhibited in an alkaline medium notwithstanding this fact.

Syrup of Hemoglobin and Calcium Glycerophosphate.

E. J. N. wants a formula for syrup of hemoglobin and calcium glycerophosphate.

We suggest the following:

Hemoglobin	960 grains.
Calcium glycerophosphate	64 grains.
Phosphoric acid.....	75 minims.
Sugar	11 ounces.
Water, to make.....	1 pint.

Dissolve the calcium glycerophosphate in ¼ ounce of water, to which has been added the acid. Dissolve the hemoglobin in 6½ ounces of water, add the sugar, then the other solution, and shake until the sugar is dissolved. Make up to a pint with water.

Each tablespoonful represents 30 grains of hemoglobin and 2 grains of calcium glycerophosphate.

A Spaying Mixture for Hogs.

A. P. I. writes: "Can you give me the address of a manufacturer of a spaying mixture for hogs?"

For spaying (ovariotomy) or castration use a 1 or 2 per cent compound solution of cresol, U. S. P. It may be had from any pharmaceutical house. Of course, the fluid is applied externally only. Wash the parts with the antiseptic before and after the operation.

Obscuring Glass.

D. W. E. W.—As a temporary frosting for windows, mix together a strong, hot solution of Epsom salt and a clear solution of gum arabic; apply warm. Or use a strong solu-

tion of sodium sulphate, warm, and when cool wash with gum water.

For permanently obscuring glass use a mixture of lead and turpentine, making a fluid a little thinner than paint. Then take a pouch of cotton batting covered with one layer of cheese-cloth and daub the mixture on the glass. In a warm room it sets quickly; so apply the lead rapidly. This frosting produces a ground-glass effect and will not wash off. To scrape it off a paint and varnish remover must first be applied.

GENERAL ESSAYS.

LOST: ADAM AND EVE.

By HARRY B. MASON.

A passing statement made in one of these essays a month or more ago has struck fire among a friend or two and also among several correspondents personally unknown to me. This statement was to the effect that "few people believe any longer in Adam and Eve and their Garden of Eden." Soon afterwards, as it happened, the subject of evolution was debated at a dinner club of which I am a member, and altogether I have had a chance to see that "our first parents" do have quite a number of advocates after all.

Thirty or forty years ago, when Darwin published his "Origin of Species," and made those experiments and observations which revolutionized the world of thought, war was at once joined between the evolutionist and the theologian. If the world had been untold millions of years in the making instead of six thousand; if it had been nothing but a nebulous mass at the beginning; if it had assumed form and shape only after eons and eons of time; if all the different classes of plants and animals had gradually evolved from a few primal types, or perhaps ultimately from the "primordial mud" alone; if man had himself risen slowly and painfully from the lower forms of life and was merely a higher animal; if, in short, the story of "special" and sudden creation as set forth in Genesis was utterly at variance with both reason and fact, what became of the very foundation and abutments of our religion? If you rob the Bible of its infallibility and accuracy of statement, what is left of the historical and inspiratory basis of our faith? If you insist that God did not create the world and everything in it within six days, what credit is left to Him, what place does He fill in the universe, and where has our allegiance gone?

This was the argument of the theologians, and this is why they fought evolution, tooth and nail. As experiment after experiment and discovery after discovery compelled them to yield ground inch by inch, and forced them to recognize unwelcome truths concerning the age of the world, they adjusted themselves as well as they could to the changing situation and strove heroically to explain away the facts. They first decided that the six days of creation were long allegorical "periods" of time, and they passed on to devise other ingenious but sophistical hypotheses to confound and refute the evolutionists. "Science" and "Religion" were

at swords' points. They were at open and determined warfare, and it was felt that one or the other must fall.

This was the situation thirty or forty years ago, but happily neither science nor religion has fallen. Both have come out of the contest stronger than ever. Religion has finally yielded to Science, and Science has reciprocated by producing a firmer Religion. The two have become perfectly reconciled, and they now live together like brothers.

That the theologian should yield was inevitable, for there came a time when the facts could no longer be denied. The evidence was too overwhelming. The geologist proved by the stratified rock that for the most part the mountains had been laid down inch by inch at the bottom of oceans millions upon millions of years ago. The paleontologist found within these strata the remains of animals whose types had long been extinct, and from which our modern animals had descended through a myriad of evolutionary changes. The paleontologist also found prehistoric man embedded in the rocks back in the pliocene and even in the miocene ages—a type of man greatly inferior to the one familiar to us in history. The archeologist discovered indisputable records of an Egyptian civilization of a pretty high character at least seven thousand years before Christ and three thousand years before Adam and Eve were supposed to have been created the "first man" and the "first woman." The experimental botanist and the experimental biologist of Darwin's time and after saw plant and animal types change; they saw new species appear; they proved therefore the fallacy of the belief that "every living creature was created after its own kind," and they gave a powerful impetus to the evolutionary hypothesis and to the belief in the slow development of man from the lower animals. In the meantime the experimental psychologist proved that the mental characteristics of the higher animals, and sometimes of the lower animals also, were surprisingly similar to those of man himself, so that the ascent of one from the other represented a difference in degree but not necessarily in kind.

All of this evidence, and much more of an equally impressive and unanswerable character, could not be denied, and it no longer is denied by thinking men. But how has the theologian adapted himself to the situation and come out of it with a richer and deeper faith? He now sees that the doctrine of evolution implies a greater God than the doctrine of special creation. He realizes that God is himself identified with the natural laws which have caused, and which are still causing, the untold changes of time; that through these great laws God is ever working upward and onward in ways which are truly astonishing and marvelous; that higher and higher types are constantly being formed; that the world is steadily growing better and better; that God is working out a vast, complex, intricate spectacle far sublimer than that implied in a mechanical manufacture of a puppet world done in six days; and, richer and sweeter than all this, that God is in His world, that He is of His world, and that He is part and parcel of the whole grand scheme. The modern theology has thus brought the Creator much nearer and much closer to man than the old theology was able to do, and it has yielded a much more human and sympathetic God. In the language of Lyman Abbot, it has made every day a creative day.

As for the Bible, it is no longer looked upon, and need not be looked upon, as an infallibly accurate document. It chiefly comprises the history and the literature of the ancient Hebrews. But the ancient Hebrews, though a wonderful people, could not be expected to know as much about theology or any other science as we know several thousand years later, and it is not surprising that they fell into doctrinal errors. Their notions of the creation, the fall, and the deluge were the current notions of the time, and were borrowed bodily from the older religions of Egypt, Assyria, and Phœnicia. But these stories, as translated by the Hebrews, were often beautiful literature, and they taught human lessons which are as pertinent to-day as they were a thousand years or two before Christ. The command of God, and likewise the command of natural law (one and the same thing), that we must not yield to temptation, is set forth in Genesis with a strength and conviction which makes the book one of great power entirely regardless of what our notions may be about creation. This book, like much else in the Bible, is to be read as a beautiful fable, or a moral allegory, and not as literal fact.

Turning now to lighter phases of the subject, and leaving heavy seriousness behind, let it be said that some of the foregoing considerations were touched upon at the dinner debate mentioned in the first paragraph of this essay, and it there became apparent, as already intimated, that some very good people still reject evolution and cling to Adam and Eve as their distant progenitors. A few of them, with pride in their family tree, object to the anthropoid ape as either an ancestor or a cousin, apparently forgetting that the imitative characteristics of the monkey are still everywhere in evidence and that as soon as one woman purchases a peach-basket hat all womankind at once resembles a fruit market on a fashionable scale.

Still others believe that mind and soul are typical of man only, are not to be found in the lower animals, and that therefore man could not have developed from them but must have been "created after his own kind." One of the speakers at the dinner was a teaching psychologist who recited some interesting experiments he had been making for the last two or three years to show the comparative mental characteristics of the rat and the man. The same complex labyrinth had been used for a colony of rats and a group of university students. The students were told to reach a certain objective point by the shortest possible route: the rats were in effect made to do the same thing by putting food for them in the same location. The identical colony of rats was kept under close and careful observation for months; meanwhile the form of the labyrinth was changed from time to time; and the result was that the rats rapidly developed the power of reasoning, grew to eliminate their mistakes one by one, and learned the direct route almost as quickly as reasoning man himself.

The result of this experiment was cited to show the fundamental similarity in mind between man and even the lower animals, but possibly the speaker failed to attribute the mental power of the rat to its proper source. Is it not more probably due to the close contact with the feminine brain which the rat has enjoyed now for several years?

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., MARCH, 1911.

No. 3.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	-	-	-	\$1.00 per year
Foreign countries,	-	-	-	1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.	-	-	MONTREAL, QUE., CAN.
378 ST. PAUL STREET,	-	-	19 AND 20 GREAT PULTENEY STREET, W., LONDON, ENG.
125 YORK STREET,	-	-	SYDNEY, N. S. W., AUSTRALIA.

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY.

LIQUOR LEGISLATION.

The Michigan Retail Druggists' Association, a new society organized a couple of years ago in the western part of the State, but already having a large membership, is somewhat at loggerheads with the Anti-Saloon League over the question of liquor legislation. The present liquor law in this State restricts the sale of liquor in dry counties to physicians' prescriptions, and directs that such prescriptions may not be refilled. It also renders it necessary for druggists to report their sales monthly to the prosecuting attorney of the county.

The M. R. D. A. declares that this law has been flouted by a large number of physicians, who have conducted a thriving traffic in the sale of liquor

prescriptions at prices ranging from 10 to 25 cents apiece; that pharmacists who have dispensed such prescriptions in good faith have been unjustly prosecuted; that the courts have exempted the physicians from blame and have punished the druggists; and that in putting the word of physicians above that of pharmacists the State has done great injustice to a reputable class of men besides subjecting them to exceedingly unfair prosecution.

The M. R. D. A. has therefore drawn up a bill eliminating the physician from the problem, and providing that liquor may be sold only in dry counties to those consumers who sign affidavits that they are buying the substance for legitimate medicinal purposes. The bill would make every such druggist a notary public, and the purchaser swearing to the affidavit would therefore make it a legal document. Then, if the consumer was found to have lied, he would himself be subject to prosecution for perjury. It will be seen that this bill would take the responsibility from the physician and place it upon the purchaser himself. Some measure of responsibility, however, would also attach to the druggist, and it is provided that he must not sell liquor to certain "posted" persons, or to any one in excess of a certain quantity every twenty-four hours.

The Anti-Saloon League is not willing to give its approval to this measure, but has had introduced into the State legislature, now in session, an amendment to the existing law seeking to overcome some of the objections of the pharmacists. Thus, the person who buys alcohol for scientific purposes, or wine for sacramental purposes, will be considered guilty of perjury if he falsifies in the affidavit which he is compelled to make out before he can buy these substances. Thus also a new provision is added plainly subjecting physicians to the penalties of the act if they prescribe liquor illegitimately and not for the proper treatment of patients under their care.

Whether these concessions will satisfy the M. R.

D. A., or whether it will insist upon the introduction of its own measure, we are not able to say at this writing. Last month a conference was held by the legislative committees of the M. R. D. A. and the Michigan State Pharmaceutical Association, the object being to discuss both measures and to decide what attitude would be taken by the retail drug trade of the State. The subject is one of great importance, and it is realized that if pharmacists go too far in opposing the Anti-Saloon League a good deal of undesirable and hurtful newspaper publicity may result.

* * *

**UNITED DRUG
COMPANY
REORGANIZED.**

The latest Napoleon in the drug business is Louis K. Liggett, of Boston, who seems to be mounting upwards in an aeroplane. The most sensational piece of news last month was the reorganization of the United Drug Co. and its incorporation under the laws of Massachusetts at a capitalization of \$5,000,000. Under the new charter the several auxiliary corporations which Mr. Liggett has organized from time to time will all be brought under the tent. This includes the Liggett chain of 35 or 40 drug stores through the eastern and middle western States, the most recent additions to which are two stores purchased from the Columbus Pharmacy Co., of Columbus, Ohio.

The absorption of the Louis K. Liggett Co. into the United Drug Co. may in part have resulted from the litigation instituted during the last year by John B. Cobb. At any rate, a feature of the new arrangement is that Mr. Cobb withdraws his suit, and the dove of peace has apparently poised itself over the differences between Mr. Liggett and the Riker interests represented by Mr. Cobb. Mr. Liggett receives \$100,000 of common stock in the new company by turning over to it his interest in the Louis K. Liggett chain of stores.

The new United Drug Co. will have 50,000 shares of preferred stock at a par value of \$50 each, and 25,000 shares of common stock at a par value of \$100. The reorganization of the company is declared to have been caused by a desire to bring all of the Liggett group of enterprises together, to avoid duplication of expense, and to secure money for the further development of the business. The preferred stock will pay dividends of 7 per cent, but the common stock is expected to do much better than that.

In the meantime we observe that the Washington

Coöperative Drug Co., which was apparently a local buying club organized under the ægis of the A. D. S., like others throughout the country, has thrown up its hands, has declared the enterprise a failure, and is going out of business as fast as the receivers can close up the accounts.

* * *

**ANTI-NARCOTIC
MATTERS.**

There is nothing particularly new to report concerning the Foster anti-narcotic revenue bill in Congress. Before this number of the BULLETIN reaches its readers Congress will have adjourned, and it cannot be foretold at this writing whether or not the bill will become a law. Such an outcome is doubtful because of the important business before Congress at this short session, and particularly in view of the time needed for the discussion of such vital questions as Canadian reciprocity and the direct election of United States senators. If the bill is passed, however, it will doubtless be modified in several respects so as to be less burdensome on all branches of the drug trade. The bonding of retailers may be cut out, and there is some talk that even the revenue feature may be eliminated.

In the meantime we observe that the Dominion parliament in Canada is getting after the narcotic traffic energetically. In 1908 a law was enacted which has had the result of suppressing the manufacture of smoking opium. Importation has continued, however, and a new bill has been devised which subjects every person to a \$500 fine who imports, manufactures, sells, or has in his possession opium, morphine, or cocaine for other than scientific or medicinal purposes. It seems that in Montreal alone 125 arrests of persons for the sale or use of cocaine have been made during the last six months by the city police.

* * *

**PROPAGANDA
WORK.**

It would seem from a report in the *P. A. R. D. Bulletin* that the Philadelphia Association of Retail Druggists has had a banner year in the propaganda work. Within a week or two not long since there were, for instance, no fewer than five get-together meetings in five different districts throughout the city. These meetings were financed in part by the parent organization, which contributed \$75 to each of them, and in part by the district members, who made up the balance of the money required. Franklin M. Apple, chairman of the Ethical

cal Preparations Committee of the P. A. R. D., is entitled to much of the credit for such excellent work. A detailed report of all five meetings was printed in a recent issue of the *P. A. R. D. Bulletin*, and altogether it would seem that the Philadelphia druggists have taken hold of the problem with their characteristic energy and success.

Perhaps the most interesting propaganda meeting held during recent months was that tendered by the Ohio Valley Druggists' Association to the physicians of Cincinnati. This was made notable by the men who were secured to deliver the addresses. John Uri Lloyd served as toastmaster, and the opening talk was given by Mayor Schwab, Ph.G., M.D. Secretary Potts of Chicago, Prof. James H. Beal of Scio, and Dr. W. C. Anderson of Brooklyn, all came from considerable distances to have a part in the programme, while two or three of the most distinguished physicians of Cincinnati represented the medical profession on the toast list.

* * *

SUNDAY CLOSING. The California Drug Clerks' Association has recently achieved quite a triumph. Inaugurating a movement for Sunday closing in San Francisco, it has finally persuaded all of the proprietors to lock up their stores between the hours of 1 and 5 o'clock Sunday afternoon. In Los Angeles the druggists' organization has attacked the problem and apparently solved it in a satisfactory manner. The city has been divided into districts, and in each district hereafter one store will remain open on Sunday for prescription work. The druggists will take turns, and notices will be posted on the doors of the closed establishments directing customers where they can get their drug supplies.

* * *

THE LATE WM. C. MCPIKE. One of the fine old men in the jobbing trade passed away recently in the death of William C. McPike, president of the McPike Drug Co., of Kansas City, Mo. He was 74 years old. Entering the retail drug business in 1853, and the wholesale business in 1856, Mr. McPike had been engaged in the drug trade continuously until his death except for two years spent at the Philadelphia College of Pharmacy in order to equip himself more thoroughly for his calling. He was graduated from the P. C. P. in the same class with Prof. L. E. Sayre. The McPike Drug Co. was established in Alton,

Kansas; as it grew it was moved to Atchison, Kansas; and as its growth still continued it became necessary in 1904 to go to Kansas City, Mo. Judge W. C. Bland, a son-in-law of Mr. McPike, and the vice-president of the company, will doubtless succeed to the presidency.

* * *

PHARMACEUTICAL ATHLETICS.

We gather from a recent illustrated article in one of the Philadelphia newspapers that the Philadelphia College of Pharmacy is making a great feature of its gymnasium. Pictures are given of both the Director of Physical Education and the Instructor of Gymnastics at the college, and views are presented of the boys at their various exercises. A group cut of the basketball team is particularly interesting. The gymnasium is located on the fourth floor of the college building, and the students have apparently taken to it like ducks to water. It will be recalled that the P. C. P. football team (or was it the baseball nine?) played a brilliant game last year with the New York College of Pharmacy. We are evidently entering upon days of pharmaceutical athletics.

* * *

P. A. R. D. BACK IN THE FOLD. There is great rejoicing in the camp, for the Philadelphia Association of Retail Druggists has come back as a part of the N. A. R. D. forces. This happy result has been foreseen for several months, but before it could be realized sore spots had to be healed over, and apologies made for unkind things said in the heat of temper. But finally the brothers have patched up their differences—or have agreed that there really were no differences in fact, and everybody is happy. The chief peacemakers were President H. B. Guilford and Executive Committeeman Henry W. Merritt. The sun now shines resplendent in the heavens.

* * *

J. WINCHELL FORBES.

The death of J. Winchell Forbes occurred just too late for us to mention in the *BULLETIN* last month. Mr. Forbes was one of the unique characters in American pharmacy. He had had a varied experience as retail druggist, professor in the California College of Pharmacy, originator of a diastase product twenty or thirty years ago, employee of a Cincinnati jobbing house, and editor of

the company's house organ. During the last two or three years his health had failed him, and from his home in a small town in Ohio he had contributed monthly to the *Midland Druggist* a series of interesting, trenchant, original comments on current developments in pharmacy. Optimistic even in the discouragements of his later years, always buoyant despite the infirmities of age, he certainly presented a spectacle of courage which it would be hard to surpass.

* * *

NATIONAL MEETING OF THE CLERKS.

Elsewhere in the present issue of the BULLETIN we are showing portraits of the nine officers of the National Association of Pharmacologists—the organization of drug clerks which has been formed in the city of Columbus, Ohio, during the last year or so. We are informed that the first annual convention of this association will be held in Columbus on June 20. It is thought that a one day's session will be sufficient for the transaction of business in view of the fact that the organization is still young, and that the district, State, and county committees are as yet incomplete. The N. A. P. is a delegate body, and the work is to be accomplished through these local committees appointed or elected in each section.

* * *

THE POSTAGE- STAMP EVIL.

It would seem that stamp-vending machines are gradually gaining in favor among druggists. The BULLETIN has within recent months published several enthusiastic letters from its readers, and we are giving space to another this month. In Chicago the pharmacists of the Hyde Park section were to hold a meeting last month for the purpose of inspecting the different makes of vending machines, selecting some one of them, and then making a group purchase. The postage-stamp nuisance is bitterly resented by a good many druggists, and it would seem that stamp-vending machines offer a very convenient solution of the problem.

* * *

Thomas V. Wooten, the well-known ex-secretary of the N. A. R. D., has connected himself with the United Drug Co. and will undertake the work of organizing the "Rexallites" of the United States and Canada into State and provincial clubs. The initial meeting of the new Michigan club we are reporting upon elsewhere in this issue of the BULLETIN.

The much discussed anti-narcotic ordinance in New York City has finally been so amended as to exempt preparations of "the latest Dispensatory or National Formulary," in each dose of which there is not to exceed one-half grain of powdered opium or its equivalent of the alkaloids. External preparations are also exempted, but they must be marked "poison."

* * *

We erred last month in reporting that Prof. W. F. Clark, of Chicago, had been elected to succeed Professor Hallberg as chairman of the Pharmacopœial Sub-committee on Miscellaneous Galenicals. Professor Clark succeeded Professor Hallberg to membership on the general committee, but not to the chairmanship of the sub-committee.

* * *

Clarence O. Bigelow, the well-known druggist in New York City, has recently been elected to the presidency of the West Side Savings Bank, located at the corner of Sixth Avenue and Ninth Street. Mr. Bigelow has been a trustee of the institution for upwards of twenty years.

* * *

The Pennsylvania Board of Pharmacy has caused the arrest in Pittsburg of 18 druggists and several clerks for the unlawful sale of cocaine, morphine, and other narcotics. This "raid" followed three months of quiet work done by one of the agents of the Board.

* * *

Jacob Diner, formerly active in N. A. R. D. circles, has been compelled to retire from business as a retail pharmacist and has made a settlement with his creditors. It is reported that his failure was due to local competition from the Riker-Hegeman Co.

* * *

One of our "esteemed" contemporaries, in making capital of the death of Professor Hallberg by connecting a subscription offer with contributions to the Hallberg fund, has shown itself possessed of ahead-of-date shrewdness of a quite remarkable sort.

* * *

W. W. Bartlett, pharmacist, chemist, and lawyer, of Boston, and a man prominent in the pharmaceutical affairs of Massachusetts, died recently at the age of 64.

EDITORIAL.

THE ADVANCE OF SPECIFIC THERAPY.

Probably no movement in modern medicine is of more interest to pharmacists than the specific treatment of infectious processes. Discoveries in this field have followed one another thick and fast. Hardly more than a year or two ago Bacterial Vaccines were introduced. To-day their use in suppurating affections is quite general. Sodium cacodylate has been known for years; but it was only a short time ago that its value in the treatment of syphilis became apparent. This disease, for centuries the scourge of civilization, has at last bowed to the mighty power of science. Ehrlich's "606" is now in the market, and promises to accomplish wonders in the cure of the ravaging plague.

Certainly these are great days in medicine. We read a lot about organotropy and parasitotropy, the former referring to the destructive action of substances upon the body tissues, the latter to the power of drugs to kill infecting organisms without harming the human system. You catch the idea? We are looking forward to a great specific therapy, *magna therapia specificans*, that will give us a definite cure for each germ infection. We have learned that it is possible to inject into the blood stream products which will destroy certain organisms there present without attacking the tissues. What we want is more of these chemicals which will unite with, alter and destroy germ cells, but leave the human body unharmed. The products are there to be found if we only have the brains to find them. Ehrlich's great discovery is itself enough to show that all things are possible to him who will but think and work.

The development of specific therapy must go down in medical history as one of the achievements of the century. Tuberculin, we already know, picks out the tubercular spot and confines itself to the one focus. Sodium cacodylate and "606" act only upon certain kinds of diseased tissue. Bacterial vaccines, now in their infancy, are but a step in the progress toward the specific therapy of infectious processes. All this is extremely encouraging to the pharmacist for it calls a halt to drugless therapy and bids the therapeutic nihilist hold his peace. It should

help to increase fourfold the people's confidence in drugs and medicines.

The near future may witness further progress in the field of specific therapy. A chemo-pharmacology is developing with an encouraging rapidity. Men are attempting to set pharmacology on a chemical basis—to explain the therapeutic power of drugs by their chemical reactions. A striking achievement in this field is seen in "606," already referred to. The chemical composition is evident from its proper name, Dioxydiamidoarsenobenzol. While experimenting with substitution products of atoxyl (sodium paramidophenylarsenic acid) it was found that the transposition of the amido radical to the third position of the benzene nucleus caused a remarkable change. It reduced the organotropic properties of the drug without lessening its parasitotropic power. It was found, too, that the five-valent arsenic such as is present in atoxyl is far less able to destroy the syphilis organism than is trivalent arsenic, such as we have in Ehrlich's "606." The process of destroying the parasite is evidently a chemical reaction involving a process of reduction. Certainly this whole work of Ehrlich and his associates remains a wonderfully interesting bit of chemo-therapy.

Now what does all this mean to the pharmacist? It signifies that he must be better trained than ever in organic chemistry if he expects to be an up-to-date dispenser. A laboratory course in organic syntheses, a fair acquaintance with benzene derivatives and aniline compounds, and even a rudimentary knowledge of bacteriology are becoming indispensable to the apothecary who would be a master of pharmacy in its latest developments. Hitherto when a new organic chemical was introduced, the pharmacist could dismiss it with the thought: "Well, I get a call for that perhaps once a month, and when I do it is no trick to make a capsule, powder or solution of the drug. Why should I concern myself with its composition?"

But things have changed. If the use of the Ehrlich remedy, for instance, becomes general, a man may be called upon any time to dispense it—a chemical task that demands more than a rudimentary training in chemistry and a superficial knowledge of the chemicals to be dispensed.

If chemo-therapy develops greatly we shall doubtless in time see specialists among pharmacists as we do among physicians. In the larger cities

or towns there will perhaps be men schooled in organic chemistry and quantitative analysis who devote themselves largely to the dispensing of organic solutions for hypodermic injection.

A NET PROFIT OF 17.5 PER CENT!

A druggist in a country town in Illinois has submitted to us a statement of his business for 1910 with the request that we comment upon it. The main facts in the statement are the following:

Sales	\$13,629 54
Cost of goods sold.....	8,928 10
Gross profits	4,701 44
Expenses:	
Salary	\$1,000 00
Clerk's salary	570 50
Light	80 00
Rent	300 00
Other expenses	346 13
Total	2,296 63
Net Profits	2,404 81
Depreciation in stock and fixtures,	
5 per cent.....	205 00
Inventory	4,120 32

On the face of this showing the proprietor seems to be making pretty good money. His net profits were \$2404.81. Subtracting from this amount \$205 for depreciation, we have actual net profits of \$2199.81. Adding to this in turn \$1000 for the proprietor's salary, we find that his total income from the business was \$3199.81—practically \$3200 from a business of \$13,000 or more.

Dividing the gross profits by the sales, we find that the percentage of profit was 34.5—a fair average. Dividing in similar manner the expenses by the sales we find that the percentage expense was 17. This is unusually low and we suspect that, as often happens, the proprietor neglected to charge up to the expense account a number of things that properly belonged there. It would seem quite surprising, too, that a business of this size could be transacted entirely by two people—the proprietor and one clerk, without even the assistance of a boy. Evidently the owner and his assistant stuck pretty closely to their knitting! Assuming therefore that by economy the expenses actually were kept down to 17 per cent of the sales, and subtracting this figure from the percentage of gross profit amounting to 34.5, we find a percentage of net profit of 17.5—certainly an unusual figure. The item of rent

is very low, and this would assist also in keeping down the expense rate.

The inventory value of stock and fixtures is \$4120.32. This means that the investment was turned over more than three times during 1910, and this of course is excellent. Other things being equal, the faster one can keep his money moving the better off he is.

THIS ISSUE OF THE BULLETIN OF PHARMACY.

There are several unique features of this number of the BULLETIN that we should like to call particularly to the attention of our readers:

1. The two pages of druggists' residences are especially interesting to us, and we hope they will be to others. Incidentally these pictures will show that pharmacists are quite as prosperous and quite as keen home-lovers as any other class in the community, despite the prevailing conception that they have no time for their families. We have a good deal of pleasure in exploding this time-honored notion.

2. In addition to these two pages of druggists' homes the Illustrated Section contains four other pages. The nine clerks comprising the officers of the National Association of Pharmacologists; the nine portraits of well-known secretaries of the State pharmaceutical associations; the full-page picture of Charles Rehfuß, of Philadelphia, showing him at work at his desk; and the excellent cartoon of H. B. Guilford, president of the N. A. R. D.—we believe these features will all commend themselves heartily to our family of readers.

3. Besides the cartoon of President Guilford, there is a very readable sketch showing how Mr. Guilford has evolved from an ambitious drug clerk without money, to the possession of two large and prosperous establishments in the city of Rochester, N. Y., with a third about to be opened.

4. "My best paying side-line" is a theme discussed in the most practical, money-making style by nine experienced and successful druggists. It may or may not be significant, but we observe that four of these nine men have found photographic supplies to yield the best returns of all of their side-lines. Two other contributors give the first place to cigars, and one each to post-cards, stock foods, and canary birds and goldfish. In addition to this, one of the four men who make photographic supplies their leading line, speaks with equal enthu-

siasm of confectionery. Are these, then, the most profitable side-lines? We should be glad to hear from others what their experience has been—and what their sales-promoting methods are.

5. We think also that special attention is deserving to the contribution of H. B. Molyneaux on "The Manufacture of Greaseless Cold Creams." Mr. Molyneaux has experimented widely with these products, and he gives several formulas which have been the fruit of his experience.

6. Our department of "Letters" this month is fine—just what we are anxious to make it! It contains a variety of short, terse, practical, meaty communications of live interest to druggists generally. Let us hear from *you* with letters of this character.

We might also speak of two prize offers mentioned this month, of the continuance of our much-valued department of "Board Questions Answered," and of the wealth of practical and interesting material of one kind and another which we have sought to crowd into every page and corner of the journal—but we have already chatted long enough.

Anyway, we have tried hard to turn out a pretty good issue this month. How do you like it?

MORE LAY ADVICE.

The lay magazines seem of late to run to medical and pharmaceutical topics. Without attempting to explain this strange predilection of theirs for things that we have always felt are peculiarly our own, we can't refrain from poking a little fun at some of the things published. The latest is talc and vaselin as a hair dressing. This combination was suggested in *Harper's Bazar* as a new method of treating women's hair. The writer prefaces her suggestion with the hope that it may help other girls.

"After washing my hair," she writes, "it always used to be unmanageable for a whole week—soft and limp so that combs and hairpins simply wouldn't stay in it. Now I have no trouble at all. I wash my hair at night, and after drying it rub vaselin on the scalp before going to bed. In the morning I sprinkle it freely with talcum powder, which takes the grease from the hair, and then brush the powder out. This gives the hair enough body, as it were, to make it perfectly manageable, and doesn't make life a burden, as it generally is to a girl for several days after washing her hair."

Druggists may now make P. M.'s of their hair

tonics. They are to be replaced by the ingenious formula of our lay friend. But perhaps we should touch only lightly on this bit of pharmaceutical erudition because it was contributed to the Girls' Exchange of *Harper's Bazar*. Here a child is in her own province, and if the formula savors of infantile intelligence, some allowance must be made for the tender age of the contributor. When she matures, however, it is to be hoped that she will be able to obtain from the pharmacist better preparations for the hair than vaselin followed by talc.

"Give the hair body." We should think it would! Add a little dust from the street and we can see how a head of hair treated with the mixture would take on a fairly firm consistency. But why not try plaster of Paris at the start and be done with it?

\$2.50 FOR EVERY ACCEPTED ARTICLE.

Here you are—a brand-new prize offer.

"Best Advertising Schemes" have been so successful with the BULLETIN that we are going to start a department of "Best Soda Schemes."

\$2.50 for every accepted article!

Tell what method for increasing the sale of your soda has proved most successful—how you followed it—what the results were. Get right down to brass tacks and give the details.

If advertisements of any kind figured in the plan, send us specimens of these for reproduction.

Or if you have *anything* novel to say about the way you have conducted your soda fountain—send it along.

That's it—*anything* good about the soda business—anything that will help the other fellow.

\$2.50 FOR EVERY ACCEPTED ARTICLE!

WE STILL HAVE THAT \$20.00!

Our prize soda formula contest seems to be dragging. We've had some contributions, but we ought to have a lot more.

We are really tired of holding this twenty dollars—it's getting heavy.

Come along, now—submit your crack soda formulas.

Ten dollars for the best one, and five dollars each for the two next best.

Contest closes soon, and the prize-winning formulas will be printed next month.

THE HALL OF FAME.

A VETERAN IN THE SERVICE.

Anybody who has ever met Dr. J. B. Bond, Sr., of Little Rock, Ark., has been attracted by his virile and cheerful personality. When the Doctor sent us the portrait some time ago at our request he remarked with characteristic vigor: "I didn't kill the barber who trimmed my

DR. J. B. BOND, SR.

mustache in a *straight line* the day I sat for this picture, but now I wish I had!" Those who have attended during recent years the annual meetings of the National Association of Boards of Pharmacy will particularly smile at this quotation and will recall the straight-from-the-shoulder manner in which Dr. Bond has expressed himself at these gatherings. At the same time, however, everybody knows that underneath this gruff exterior is a heart throbbing with kindness and courtesy.

Dr. Bond was born in 1836 and is therefore in his 75th year—still very much in the ring! He served four years in the Confederate army, attained the rank of Division Surgeon in Price's division, and remained on duty until he was compelled to surrender at Little Rock in May, 1865. He practiced medicine until 1872, then entered the retail drug business, to stay in it until his retirement in 1908. In 1895 he was appointed a member of the Board of Pharmacy, the next year was elected president of the board, still holds that office, and his present commission does not terminate until 1915. Dr. Bond was author of the State pharmacy

law of 1891. He was also one of the promoters of the State Association of Pharmacists organized in 1883, and was president of the society from 1884 to 1887.

Now, in his 75th year, he needs no spectacles, and he is a true gentleman of the South, suh!

THE DEATH OF LEO ELIEL.

Leo Eliel of South Bend, Indiana, died suddenly in his store early last month. This removes one of the few remaining pharmacists of the old school. Mr. Eliel was a product of the German apprenticeship system. He came from Prussia with his parents when he was 15 years old, and shortly afterwards was indentured to a German pharmacist in Indiana who had himself been in this country only a few years. The training was very severe and very thorough. It developed habits of experimentation and study which were never abandoned, and throughout his whole career Mr. Eliel was a practical pharmacist of unusual skill.

Such a man, cherishing the ideals of his profession, would very naturally connect himself with the American Pharmaceutical Association. Mr. Eliel was long a member of the organization, filled

LEO ELIEL.

many offices within its gift, and was finally elected to the presidency several years ago. Just about that time he sold out his interest in the drug store in South Bend with which he had long been connected, and some time afterwards opened what he hoped

to make a purely ethical and prescription pharmacy. In this, however, he was somewhat disappointed, and it was considerable of a shock to his ideals to find that there was barely enough public support for such establishments except in the larger cities.

A brother, J. C. Eliel, one of the most brilliant men which the jobbing trade of the country has yet produced, died some years ago in Minneapolis. The two men were quite unlike each other. One was an aggressive business man of great adaptability. The other was a modest, retiring scholar who had more or less difficulty in transmuting his ideals into practical results.

MAKING MONEY IN THE DRUG BUSINESS.

These are evidently the days to pile up a reasonable amount of money in the practice of pharmacy—that is, if you know how to turn the trick. There is Thomas Voegeli, for instance—the man in Minne-

THOMAS VOEGELI.

apolis whom everybody in N. A. R. D. and Rexall circles knows all about. Some months ago we told how Mr. Voegeli had purchased a building lot at a cost of \$18,750 and was going to erect a \$16,000 residence on it. Now we find that more recently the firm of Voegeli Bros. has opened its third store in Minneapolis—a branch in the West Hotel.

It is reported that the investment in this new property represents about \$40,000, that from 10,000 to 12,000 people visited the store on opening day, that the sales on that day approximated \$1200, and that the business since then has been very gratifying

in volume. The Voegeli gospel was enunciated in these pages some months ago when Mr. Voegeli declared in a letter that the thing for druggists to do was not to worry about chain-store domination or any other form of competition, but to get busy and build up the very best service they knew how—to attend to their own knitting and do a thorough job at it!

APPOINTED TO AN \$8000 OFFICE.

The roster of druggists who are successful in politics continues to enlarge. One of the recent instances brought to our attention is that of G. Edward Schulz, a pharmacist in Milwaukee. Mr.

G. EDWARD SCHULZ.

Schulz has just been appointed by President Taft to the office of Collector of Customs for the District of which Milwaukee is the center, and the appointment has been confirmed by the senate. Mr. Schulz was recommended for the office by Senator La Follette, and it might be said that Mr. Schulz has been active in the insurgent Republican movement for several years and has been an ardent supporter of the Senator. He is treasurer among other things of the Republican State Committee of Wisconsin. The collectorship of customs in Milwaukee means an income of about \$8000 a year, which is equivalent to the salary of a United States senator, and the mere fact that Mr. Schulz would be recommended for such an office indicates beyond doubt that he occupies a commanding position among the progressive Republicans of Wisconsin.

E. F. Heffner, secretary Pennsylvania Pharmaceutical Association, 13 West Water Street, Lock Haven, Pa.

Robert M. Dadd, 182 18th Street, Milwaukee, Wis.—the house in the center of the picture is Mr. Dadd's.

John C. Wallace, ex-president of the Pennsylvania Pharmaceutical Association, Mercer St. and Wallace Ave., New Castle, Pa.

C. S. Ashbrook, president Ohio Pharmaceutical Association, Mansfield, Ohio—the first house at the right.

Dr. Edward Kremers, dean of the School of Pharmacy of the University of Wisconsin, in the suburbs of Madison.

Wilhelm Bodemann, the irrepressible critic of all things pharmaceutical, Hyde Park, Chicago.

Homes of well-known druggists.

The house at the right is that of Major Ed. J. Rodgers, secretary of the Michigan Board of Pharmacy, 1217 Pine Grove Avenue, Port Huron, Mich.

This is a view of Pine Grove Park, Port Huron, Mich., which is right across the street from the residence of E. J. Rodgers shown in the opposite column.

John G. Godding, president of the American Pharmaceutical Association, Boston, Mass.

This shows a corner of the living room in the Godding camp up in Maine among the Rangeley Lakes.

Charles H. McConnell, proprietor of the Economical Drug Store on State Street, Chicago, has this home at 4417 Ellis Avenue.

This shows the living room in Mr. McConnell's residence, beautifully decorated and furnished after the Empire style.

Druggists Photographed in Their Stores.

1. Charles Rehfuess, Philadelphia, Pa.

H. B. Guilford, president of the N. A. R. D., as seen by the Bulletin cartoonist.

(See illustrated article on Mr. Guilford on the next page.)

THE PRESIDENT OF THE N. A. R. D.

H. B. Guilford of Rochester, N. Y.—Has Two Prosperous Stores and a Third Under Way—Made Stockholders of His Best Clerks—Something About the Man Himself.

By HARRY B. MASON.

H. B. Guilford, president for 1910-11 of the National Association of Retail Druggists, is a man wise in his day and generation. The average druggist, you know, is pretty much of a slave to the long hours and the close confinement of the busi-

H. B. Guilford, Rochester, N. Y., president of the N. A. R. D.

ness. He cannot seem to get away from it. He cannot detach himself, so to speak, and view his business objectively. He is in it and of it all the time.

Not so with this man Guilford. He worked pretty hard and pretty systematically to get a start, as all men must who succeed, but the lesson to be read from his business prosperity is this, that he learned to build up an organization to look after the details, and kept himself more or less free to do the heavy thinking and to get some of the recreations and enjoyments of life as he went along.

GETTING BORN RIGHT.

But we can tell best how this was accomplished by looking back and telling the story briefly from the beginning. To start with, Mr. Guilford was

far-seeing enough to select a good birthday. It was July 4—in the year 1867. What can you expect but initiative and independence in a man with such a birthday as that!

Like every other boy, he was educated in the common schools of his town—which happened to be the village of Phelps in New York State. And like every druggist, he served an apprenticeship in a drug store in his home town. Later on he attended the Albany School of Pharmacy and profited so well by his studies that after the first year he passed the examination of the State Board of Pharmacy and received his registration certificate.

He admits now that he ought to have gone back and completed the course—but he was sadly in need of the necessary funds. So he secured a position in Fillmore, N. Y., and stuck to it just

Mrs. Guilford.

about a year. That Fourth of July germ was beginning to work, and Guilford wanted a store of his own. He bought a large and thriving establishment in Fillmore, having an immense and varied stock inventorying about \$600. He paid \$300 in cash and gave a chattel mortgage for the remainder. This store he conducted for two years, and in the meantime he worked about sixteen hours a day

and filled every position in the establishment from janitor up. It was good training—but it was a little slow.

JUMPING INTO THE CURRENT.

In 1891 Guilford decided to tackle Rochester. He had about \$1500 in money, and he was long on expectations. But the store that he was able to buy was in a location that didn't promise very well, and after working against the tide for some time Guilford decided to make a plunge and get into the current. So he opened a store at 138 State Street in Rochester and settled down to the task of building up a big business. At once things began to pick up. Trade grew. Guilford has what men call a long head, and during these early years he was using it. He began to see a large and prosperous business in the future, and he addressed

The Guilford store at the corner of Main Street and East Avenue in Rochester is seen at the left.

himself to the task of planning the methods and the policies which would best bring it about.

MAKING STOCKHOLDERS OF CLERKS.

In the first place he knew that he must get the hearty and the earnest coöperation of his clerks. He must have them plugging for him. Therefore it was that in 1896, five years after he struck Rochester, he caused the incorporation of the "Guilford Drug Co." His best men were made stockholders—the stock was given to them outright without conditions, and none of it was sold to outsiders. It was purely a family party.

Guilford saw that if he was to build up an organization capable of handling a big business, and the conduct of two or three stores, he must not only get the coöperation of his leading men, but he must so arrange things that he himself would not have to be chained down to one spot from early

morn of one day to early morn of the next, with Sundays thrown in. He must train his men to rely on their own judgment. He must himself

This is an interior view of the State Street store. The establishment is open all night.

learn to delegate responsibility. There is something in life besides work—and he must give himself some of the joys and recreations that every man deserves. He must, moreover, have that freshness of view and that initiative which can come only to the rested brain, and to the man who periodically gets away from his business and looks at it objectively from a distance.

So Guilford treated his men right. He developed their spirit of coöperation. He likewise developed their initiative and their capacity to run the business. He got them in the habit of looking after things themselves without expecting him to be on hand every minute of the day.

THE GUILFORD COMPANY TO-DAY.

That was in 1896. It is now the year of our Lord 1911—fifteen years later. At the present time

Mr. Guilford's residence in Rochester.

the Guilford Drug Co. is controlled by Mr. Guilford and four employees. Early this year the capitalization was increased from \$60,000 to \$75,000.

The company has two of the largest stores in the city of Rochester, and the employees number about 36. But, more than this, a third store is about to be opened in the very heart of the retail shopping district. Mr. Guilford is authority for the statement that it will be one of the most beautiful pharmacies in the East, and that from 25 to 30 people will be required to handle the proposition.

The Guilford Drug Co. conducts its business on aggressive lines. Its stores are in the down-town business district, and up-to-date methods of attracting and retaining trade are employed. Vigorous newspaper advertising campaigns are conducted, and resort is constantly had to publicity of other kinds. The courteous treatment of customers is one of the cardinal articles in the Guilford creed, and of scarcely less importance is what Mr. Guilford calls a first-class cash system.

GUILFORD, THE MAN.

Now a little about the man himself. He is and always has been a firm believer in the organization

of pharmacists. His support goes out to all efforts intended to lessen the burdens of the retail druggist. He has been a regular attendant upon the last ten meetings of the N. A. R. D., and he has done excellent work in that association. He has at various times been elected to one office or another in the organization; he has always been in the inner councils; he has been recognized as a man of strength, absolute integrity, and excellent judgment; and his promotion to the presidency at the Pittsburg meeting last September came as a matter of course.

Outside of pharmaceutical circles Mr. Guilford is known as a very ardent and enthusiastic Free Mason. He is a Past Master of the oldest Masonic lodge in Rochester, a member of Monroe Commandery No. 12, K. T., a member of the Rochester Consistory 32d degree, and a member of Damascus Temple A.A.O.N.M.S. He is also affiliated with the Rochester Lodge of Elks No. 24, and is a most active and interested member of the Rochester Athletic Club.

THE MANUFACTURE OF GREASELESS COLD CREAMS.

Three Formulas are Given as the Result of Much Experimentation—One of Them Claimed to be "Ideal"—Suggestions for Two Perfume Bases—Practical Hints Regarding the Manufacturing Process.

By H. B. MOLYNEAUX.

The readers of the BULLETIN OF PHARMACY are no doubt, like myself, always hungry for something new in toilet preparations, and therefore read every article or formula in the hope that they have at last found the ideal for this, that or the other preparation.

It is not my intention to introduce something new, but to present a formula which experience has taught me is an exceptional working recipe for one of the well-introduced toilet preparations that have always given the manufacturers much grief. This formula has been thoroughly "tried out."

It is evident to the close observer that very few of the non-greasy cold creams in the market are satisfactory from every standpoint. I do not claim that my formula will produce the *ideal* product, but it is the result of a great many long and tire-

some experiments which have extended over a number of years of laboratory work, and which have involved a try-out of almost every conceivable proportion of every material that has ever been suggested in this connection.

The first and most important feature of every preparation, as you must agree, is the choice of the proper raw material. With this end in view I will first discuss proper raw materials—how to choose them, and, where possible, shall give the tests for their identity and fitness.

MANUFACTURING DIFFICULTIES.

Non-greasy cold creams are composed principally of stearic acid or stearic acid soap. These will soon dry down to a powder through evaporation of the water by which they are emulsified; and

sooner or later this unfits them for the market. In order to obviate or lessen this trouble, manufacturers have devised every conceivable addition, such as mucilage of tragacanth, mucilage of Irish moss, arrowroot, hydrocarbon oil, glycerin, etc., according to the climatic conditions or the individual tastes of the manufacturers. I have found objection to all these additions, but least of all to glycerin.

Many manufacturers have gone to the extreme in the use of glycerin, on the plan that if a little helps, more is better, thereby making the cream just as objectionable to the consumer as a fatty cream is.

Many consumers do not like to use fatty cold creams because they leave a greasy feeling on the skin. Glycerin has the same objection when it is used in undue proportions, and it leaves the skin in a sticky condition. In fact, many women cannot use glycerin preparations that contain large amounts, as their skin is extremely sensitive and glycerin seems to produce a certain irritation.

The different ingredients and combinations used in the manufacture of greaseless creams are so diverse that it will be impossible to devote the space in this article to discuss them all; therefore I shall confine my discussion of ingredients to the ones contained in the formulas given.

THE STEARIC ACID MUST BE RIGHT.

Let us first consider stearic acid, which is found in the market in practically all grades, most of which are unfit for use in toilet preparations, as it usually has a disagreeable odor, is dark colored, or is objectionable from some other standpoint. For this preparation stearic acid should be perfectly snow-white and odorless, and rancid lots should be especially guarded against. If the least rancid, no matter how strong a perfume is used, the rancid odor will come out when the cream is rubbed into the skin.

Stearic acid is often found with more or less mechanical impurities, such as dust and grit, which should be separated by carefully melting on a steam or water bath at as low a temperature as possible. Keep in a fused condition for half an hour until all the mechanical impurities settle to the bottom, then decant, or, to use a less desirable means, allow to congeal in the same container used to melt it, and then scrape off the bottom containing the impurities.

The next and most important points to be considered regarding stearic acid are its saponification and its melting point. This article is official in the U. S. P., and I have found the tests therein given to answer all the requirements.

The U. S. P. test for saponification is as follows: "If 30 grains of stearic acid and 15 grains of dried sodium carbonate are boiled with 2 ounces of water, in a suitable flask, the resulting solution, while hot, should not be more than faintly opalescent." One thing must be carefully noted in the handling of stearic acid, or the preparations with which it is made, and that is to avoid contact with iron, copper or brass containers. Enameled or tinned vessels are suitable, providing they are in good condition.

The next item to be considered is powdered borax, and you will find it very necessary to bolt this article carefully and see that it is perfectly pure, in order to obtain the best results.

THE SELECTION OF AN ALKALI.

There are many alkalies used in preparing non-greasy cold creams, such as ammonia water, caustic potassa, caustic soda, etc. All have their disadvantages, no matter in what proportion they are employed. Their use will be noted more by the consumer than the manufacturer, as it is impossible to avoid an excess of alkali. This will cause a smarting irritation of the skin that is not easily overcome, and, where very pronounced, will leave some very bad effects if used for any length of time.

Of course it is necessary to use a certain amount of alkali to give the cream "body" and stability, and to make possible the incorporation of glycerin. You can readily understand that it is of the utmost importance to reduce the amount of alkali to the least possible quantity, and of equal importance is the choice of the particular kind of alkali.

To answer all these requirements, I have found monohydrated carbonate of soda, U. S. P., unequaled. It not only reduces the amount of alkali to the minimum, but gives the cream that smooth, satiny appearance so necessary to enhance its beauty and market value.

There are many methods of manipulation for non-greasy cold creams, and I will outline several that are more or less successful according to the individual taste and the practical experience of the operator. Taking into consideration the nature of

stearic acid, a cream can be made (1) either by melting it and forming a cream while in a liquid or oily state, (2) by forming an emulsion in the same way that fatty cold creams are made, or (3) by taking advantage of the solubility of stearic acid in a solution of hot borax water. The latter method will enable one to incorporate small quantities of glycerin with less danger of separation, but the operation must be conducted with extreme care, skill, and experience.

FORMULA NUMBER 1.

I have found the following formula one of the best in the emulsion line:

Stearic acid	36 ounces av.
White hydrocarbon oil.....	16 ounces av.
Powdered borax	1 ounce av.
Caustic potassa	1¼ ounces av.
Distilled water	172 ounces av.
Perfume to suit.....	q. s.

Melt the stearic acid on a water-bath, and when melted, add the oil. Dissolve the potassa in half the water and bring to the same degree of heat as the acid-oil solution. To the oil solution slowly add the caustic solution, stirring all the while until thoroughly saponified. Dissolve the borax in the remainder of the water and gradually add to the saponified mixture, continuing the heat until a perfectly uniform solution results. Remove from the water-bath and stir until cold.

Much depends on the perfume used, and also on the most advisable time to incorporate it. If an alcoholic perfume is employed that is likely to be injured or expelled by the heat, wait until the cream is only slightly warm before adding it. If, however, you are using one of the strong base perfumes of an oily consistency that will not be materially affected by this amount of heat, it would be much better to add it while the cream is in the liquid state and thus insure a more uniform mixture.

It is quite important that the cream be stirred without intermission during the entire process and until it is cold. While this cream is quite stable under ordinary conditions, a good "looker" at all times, and in fact in many ways a really handsome preparation, I could not recommend it as the best for the consumer.

You will have but little trouble from shrinkage; at least, it will "hold up" for a long while, but hardly long enough to market in a wholesale way. The hydrocarbon oil acts as a binder and lessens the shrinkage resulting from loss of water.

FORMULA NUMBER 2.

My next formula involves a solution process wherein I take advantage of the solubility of stearic acid in borax water. For this method it is necessary to have the stearic acid in a granular form. In order to granulate stearic acid with the least labor and expense, get a nutmeg grater called the "Ida" made in Germany by G. M. T. & Bros. In my opinion this is the best on the market for this purpose, as it is operated by a crank and fed by a hopper, making it easily handled. For the solution method, dissolve 10 ounces av. of powdered borax in one gallon of distilled water, heat on a water-bath to about 100° C., then gradually incorporate one pound of granulated stearic acid, stirring continually during the entire operation and while cooling.

This method makes a very elegant preparation. The principal objection to it is that it is apt to dry out very rapidly if not enclosed in air-tight containers.

It is possible to incorporate a small amount of glycerin, and some manufacturers have made the addition of either mucilage of Irish moss, mucilage of tragacanth, arrowroot, etc., with varying success.

FORMULA NUMBER 3.

In my opinion there is only one method for making non-greasy cold cream. By this method the resulting cream is as near the ideal as any yet brought to my attention. The formula has only been contrived after many long and trying experiments, and after trying out almost every conceivable combination and proportion possible. It yields the best non-greasy cold cream, considered from every standpoint, that can be made. Physically it is a most beautiful preparation, having a satiny finish and luster that cannot be duplicated by any other method. It will stand up longer with less loss of water than any cream on the market. To the consumer it has none of the disagreeable medicinal features so common among these creams, such as irritating or greasing the skin.

In the beginning forgive me if I impress upon you the necessity of following the *modus operandi* to the letter. One of the first steps in this operation is the use of a granite-ware kettle of from 6 to 8 gallons in capacity for making the quantity contained in this formula. Weigh out accurately:

3 pounds of stearic acid.
 24 ounces, av., of powdered borax.
 1¾ ounces, av., of monohydrated carbonate of soda.
 1½ pounds of glycerin.
 18 pounds of distilled water.
 Perfume to suit, q. s.

Weigh the water, glycerin, borax, and soda into a suitable vessel and cause solution by heating on a water or steam bath. When heated to the boiling point of the water-bath, gradually add the stearic acid, which has been previously granulated, stirring constantly all the time during the operation.

Boiling distilled water should be added from time to time during the process to make up the loss by evaporation. The operator can gauge the hardness or softness of the cream according to the amount of water used in the process. Less water will stiffen the cream; more water will soften it. Under no circumstances should cold water be added to the cream during the process, and under no conditions should either hot or cold water be used after the cream has set. The time to add the perfume, as I have already suggested, depends on the kind of perfume used. (See emulsion process.)

MANUFACTURING DETAILS.

It is very necessary that I call your attention to some of the important points to be observed in this process. First of all see that the ingredients used conform to the description in the beginning of this paper. Under no circumstances should the operator discontinue stirring the preparation during the process until the product is cold. This is of vital importance. Do not discontinue the heat until saponification is complete.

In order to give an idea to the operator as to when the cream is finished, it will be well to describe the reaction and physical changes that take place during the operation. On adding the stearic acid the solution will begin to thicken and gradually become a gelatinous mass. After due time, through heating and stirring, it will begin to fluff up, and finally it will "come down" all at once to a semi-transparent liquid. At this point it should be removed from the fire and perfume added. (See advice on adding perfume in the emulsion process.) The preparation must be stirred until cold and should never be filled into jars or packages while hot, as it is apt to separate.

This preparation can be colored to suit the individual taste. For instance, pink can be had by adding a few drops of solution of carmine, N. F.,

or any color in fact, by using one of the liquid perfume colors.

PERFUME BASES FOR THE CREAM.

A desirable perfume is a very essential requisite in this preparation, and I will give two excellent formulas for perfume bases that are especially adapted to cold creams. These bases are just as good, and yet cost only one-eighth of what some of the high-priced synthetic bases in the market do.

You will note that I give an estimated cost on each ingredient, so that the druggist may have an idea of what these two bases will cost him.

Formula No. 1.

4	ounces	Liquid Aubepine	cost \$	13
1	ounce	Concrete oil of orris.....	"	3 25
⅞	ounce	Borvordial, 10%	"	78
½	ounce	Oil of rose geranium, African.....	"	13
1	ounce	Benzyl acetate	"	10
9¾	ounces	Alcohol, deodorized	"	20
<hr/>				
16				Total....\$5 59

Formula No. 2.

8	ounces	Muguet royal	cost \$	1 25
¼	ounce	Otto rose	"	1 50
½	ounce	Otto Jasmine, "Bush"	"	2 00
1	ounce	Oil of ylang-ylang	"	2 50
¾	ounce	Artificial musk, 100%.....	"	05
6	ounces	Alcohol, deodorized	"	12
<hr/>				
16				Total.....\$7 42

Almost all manufacturers of essential oils or perfume bases carry these ingredients in stock. It is not my intention to advertise any particular manufacturer, but in order to aid those who do not know where to buy these substances I suggest W. J. Bush & Co., 100 William Street, New York, 185 East Kinzie Street, Chicago, or Linden, N. J. I have had splendid results from the ingredients bought of them.

I am especially fond of the second formula; it is exceptionally sweet and well adapted to creams of this order, and it will withstand a great amount of heat.

In compounding formula number 2, I have found that artificial musk does not readily dissolve, so I suggest a like amount of benzole benzoate in place of the alcohol. Artificial musk is readily soluble in this when slightly warmed.

Tastes differ very much as to the right amount as well as the odor to be used in creams, but I have found one ounce of either of these bases adequate for 20 pounds of product.

Nine Druggists Discuss Side-Lines.

Always anxious to help our readers improve their business and increase their profits, we invited nine druggists to give us the benefit of their experience with side-lines. They tell which line pays them best, how they display it, how they push it, what profit it yields, and to what extent they use their windows in bringing it before the public.—THE EDITORS.

POST-CARDS MY FAVORITE—AND WHY.

By J. EARL TAYLOR, PH.G., GRIDLEY, ILL.

Taking into consideration both the direct and indirect profits, I could hardly say which of the two lines, post-cards or magazines, has proved the better from a financial standpoint. I rather think I shall choose post-cards, for two or three reasons which I shall give.

DOUBLES HIS MONEY AT THE LEAST.

We figure about 100 per cent* as our direct profit in handling post-cards. We buy in fairly large

J. EARL TAYLOR.

quantities and always take our cash discounts. The cards that we retail for 5 cents, or 6 for a quarter, cost us from \$1.50 to \$2.25 per 100.

We always sort our cards. We have found that the manufacturers or jobbers of post-cards charge for them in proportion to their quality, regardless of the cost. We find among the cards of lesser

price some that in art finish are equal to the higher priced cards, and taking into consideration our customers' desires we have no hesitancy in placing them on the 5-cent rack.

As regards our two-for-five, or 25-cents-a-dozen cards, these cost us from 60 cents to \$1.50 a 100. We also sort these cards, and during the last Christmas holidays we had on our 5-cent side many cards that only cost from 75 cents to \$1 a 100. Some of them were equal to the high priced cards in art and daintiness, so you can see why, for one reason, I prefer post-cards!

We handle nothing less than the two-for-five cards. The highest cards on our rack at this moment cost on an average not over 75 cents a 100. You say this is too large a profit? No, it is not—if you can get it without losing out. We also sell cards from 10 cents each, or 3-for-25, up to seasonable cards at \$1 each. We never think of less than doubling the price, and many of our 10-cent cards cost \$4 a 100. Sometimes it is in the extra high-class cards where you can get your price. The people are as a rule not very good judges of the cost of a card, and here comes my second reason for favoring the post-card side-line. We absolutely buy of no firm that sells elsewhere in our town. Consequently the cards are rarely duplicated. We have no competition on the cards from 10 cents up, as the other merchants seem to consider them "dead stock." Let me say that, properly handled, they are certainly "live" ones.

INDIRECT ADVANTAGES OF THE LINE.

You can readily see that, so far as direct profits are concerned, we make 100 per cent or more on our post-cards. The indirect profits no one can estimate. "Goods well displayed are half sold," it is true. The *drawing* power of the post-card for use in sending short messages, for birthday remembrances, and the stork cards, the seasonable cards,

*That is, 50 per cent of the selling price.—THE EDITORS.

etc., call the customers to your store many, many times, and if the conditions surrounding your interior decorations and displays are right, they *may* see something else to purchase—if not at the time, then possibly in the near future. Another thing: people get into the habit of going to your store and that creates confidence. Why, four years ago we had several customers who only came in if they wanted a bottle of pills, and now come in like they were not afraid of a drug store!

As regards displays, we devote about 36 square feet on the north side of our store to picture racks filled with two-for-five cards. In the front showcase under the first rack we keep our high-priced cards. On the south side we give over to the 5-cent cards about 24 square feet of racks, and about 12 square feet of stand displays—inclined planes.

BOOSTING THE SALES.

Here is one strong point! We never allow a Saturday to come without changing our cards on the display racks. People are thus led to believe that we have new cards all the time, which, by the way, is a fact. But so many *never* attempt to change conditions, and are very short-sighted. The display rack over the back edge of your counter beats any other form for the simple fact that you show your cards well and they do not become soiled by handling.

The best methods for boosting sales we consider to be those already described—upright displays, constant changes, and window work. Then for special occasions combine newspaper ads., and you have our plan. We would not give up our windows for any other form of advertising that we know of. Seasonable cards we always show in our windows, and we also use the windows many times during the year for mixed cards. We always use price tickets—"choice 2 for 5 cents," etc., etc.

Summing it all up, I believe that the post-card line affords an elegant opportunity for profits. I believe it can be made to pay in proportion to the energies expended on it. We have had no old cards to get rid of for over a year now, but when we do we expect to dispose of them through the medium of our window displays, our newspaper ads., and our price tickets offering low prices.

The direct profits you can estimate closely, but the indirect ones are hard to calculate. About the only way is, after invoicing each year, to figure your net increase in business and profits over the

year before. Last year we registered a gain of 12.2 per cent over 1909. In 1909 we went backward 4 per cent, but in 1908 our increase was 15 4/10 per cent. Our invoice this year also showed an increase of about 14 per cent over 1909, and all bills paid, so you see "indirect" profits must be credited somewhere.

MAKING A PRACTICAL SUCCESS OF THE PHOTOGRAPHIC LINE.

By B. S. COOBAN & Co., CHICAGO, ILL.

We are expending most of our efforts on the photographic line, getting into it a little more each year. We consider it a good investment and one not requiring as much time as some other lines, for

B. S. COOBAN.

the manufacturers, through their advertising, send us customers who have a pretty good idea of what they want, and with a little effort one can induce them to purchase something else which they did not think they wanted at the time. This is our best paying side-line.

We devote two wall cases, 7 by 10 feet, to the display of cameras, kodaks, films, paper, plates and other paraphernalia, and also part of a floor case to kodaks.

The line pays a profit ranging from 25 to 40 per cent.

WINDOW-DISPLAY IDEAS.

We depend very largely upon our window displays for publicity, changing the display each week, and bringing out new things continually, especially

new pictures, which always attract attention. One week we will feature the Brownie line, from one to twelve dollars, showing prints made with these machines, and making much of the Brownie slogan: "Let the Children Kodak." Then we will follow with the ten-to-two-hundred-dollar line. While we do not carry in stock anything higher priced than thirty-five dollars, we can get anything wanted in two hours' time. We make a special point of apparatus and chemicals for developing and printing. We also do developing, printing and enlarging for those who have not the time or inclination to study it up and do their own work. We turn this work over to a specialty house, and clean up 33 per cent—all velvet.

Last December we held a guessing contest on a jar of pills, with a 3A Brownie camera as the prize. This created a great deal of interest. There were over 5000 guesses turned in, and every one was an ad. for our photographic department.

The manufacturers are very liberal with booklets and display cards, which we use freely.

It is advisable, yes, necessary, that at least one person in the store become thoroughly familiar with the working of the cameras, the developing and the printing, in order to render the novice assistance, and keep him from wasting too much material, for if he does not get results his pocketbook closes tight!

MAKE THE AMATEURS YOUR FRIENDS!

Photographitis is a new word used to designate the photograph disease, and the ailment has various stages from acute to chronic. What the dealer wants is to foster and nurse the symptoms until the chronic stage is reached. Do not encourage extravagance, but keep every kodak in your neighborhood working. We tell them to bring in their troubles. In most cases we can help them, and revive their enthusiasm, so that they go at it again, and the photographitis strikes in a little deeper.

A little intelligent criticism, giving praise where due, and stretching a point if necessary, is greatly appreciated, and brings you in closer relation with your customer. Convey the idea that "we are all friends together." Size up your customer and sell him the best outfit he can afford. Then make him *feel* that you are his friend. He will bring *his* friends to you, and no matter how trivial the trouble, look at it their way, and help them out—it will pay!

ENTHUSIASTIC ABOUT THE KODAK LINE.

BY ARTHUR G. LYON, COLDWATER, MICH.

It is a peculiar fact that the best side-line in this forty-year-old store is a line of goods that we have handled less than three years. Three years ago we noticed that we had a constant call for films, plates, papers, and camera supplies in general. We wrote the Eastman Kodak Co. for price lists, discounts, etc. After some little difficulty we secured the agency, and now this is our best selling side-line. As we size up the matter we find half a dozen good reasons for pushing this line of goods.

1. *Continual repeat orders.* The sale of a kodak is but a small beginning. The kodaker must be constantly buying supplies if he is to get any great amount of pleasure from his camera. He must have films or plates, chemicals, sensitized papers, and mounts for the finished pictures. Kodakery is a very fascinating pastime, and when one has become well inoculated we gain a regular customer.

2. *Exclusiveness.* Kodak agencies are limited. Most towns have but one—a wise provision of the Eastman Company to insure one good stock of their goods in each place rather than several incomplete ones. Even Detroit has only eight or nine agents. We get most of the amateur photographic business of the town and surrounding villages. New people are constantly gotten into the store, and new drug customers are gained continually.

3. *Price protection.* The kodak plan is simple yet efficient. Goods are invoiced at full retail prices from which the agent's discount is deducted. These retail prices must be maintained in all except a very few cases. The only penalty for violation of this agency agreement is that the agency will be withdrawn. However, it would be hard to find even a druggist who would care to cut prices on goods handled by no one else. The profit averages better than most kodak agents think. The agent's discount from the retail price of a kodak is 33½ per cent, and on papers and films 25 per cent, but the profit on the investment is actually 50 and 33½ per cent respectively.* A No. 12 camera costs \$8; profit \$4—50 per cent. We are careful to keep as small a complete stock as possible, thus turning over the capital several times a year. Another source of considerable profit is our finishing department, where we do developing, printing, and en-

*Profits, however, should always be based on the selling and not the purchasing price.—THE EDITORS.

larging for amateurs. This work amounts to several hundred dollars each year, of which about one-half is profit. One of our regular clerks who is much interested in the work spends a part of each morning and afternoon at it, and we are thus provided with a quick service which appeals to the amateur very forcibly. All work brought in before 9 A.M. is ready to turn out at 6 P.M. the same day.

4. *Clean goods to handle.* Kodak goods are ready to sell in most cases without even wrapping. As a rule customers know about what they want and so are taken care of very quickly. However, when one wishes to look at cameras, we give all the time necessary, knowing that in a short time we shall be well repaid.

5. *Seasonable goods all the year.* Although most of the business is done from May to November, still every month is a good kodak month. The summer months are especially active photographic times, and there is also good business clear through November, while in December we dispose of quite a few kodaks for Christmas gifts. Then the long winter evenings following the holidays are dandy times for the amateur to get out his summer and fall films, to make prints for his own album and for his friends. So there is no time when we are not more or less busy with kodak goods.

Best of all we feel that with the kodak line we are not wandering very far from the drug business. For who should be in a better position to understand and explain the chemistry of photography than the druggist?

CIGARS AND CIGARETTES—ESSENTIAL POINTS IN ATTRACTING AND HOLDING CUSTOM.

BY FRANKLIN M. APPLE, PHILADELPHIA, PA.

To reply to your request for information concerning side-lines in an intelligent and accurate manner is a very difficult task, as it is almost impossible for a retailer enjoying a moderate sized business to determine exactly what just proportion of expense shall be charged up against each department, and therefore what the department profits are, but I shall endeavor to make replies to your several inquiries, taking them up seriatim, as follows:

1. My best paying side-line is cigars and cigarettes. I include the latter, as the tendency in this vicinity is very largely to substitute "coffin nails" for Havanas.

CASES FOR THE GOODS.

2. My display of the goods is confined absolutely to cases built especially for the purpose. Cigarettes, for instance, should not be kept in humidors or moist rooms, and it is also more difficult to keep cigars properly when cigarettes are stored in the same place. I use a 5-foot Silent Salesman case for cigars, upon the top of which rests a 3-foot cigarette case.

3. As for increasing the sales, I depend upon the quality of the goods in my stock chiefly for results, ever mindful, too, that it is essential to have the

FRANKLIN M. APPLE.

stock kept in prime condition. I always endeavor to carry a good variety of popular brands, allowing my customers to indicate which they prefer, as I am no smoker myself. I do not forget that I am here to serve the public and cater to its wants, and that it is more probable that it will patronize me more frequently and steadily if I can satisfy its tastes. I never handle a cigar costing less than \$35 a thousand, thereby establishing a minimum standard of quality.

THE PROFIT.

4. The profit yielded by this line can only be estimated in the form of gross profits, based upon the cost, and in these calculations I am most glad to state that I have no necessity of reckoning upon pilfering by my present corps of assistants. The gross profit is 30 per cent. This may appear as a

low percentage, but the grasping tendencies of the manufacturers of cigarettes are reducing the profit upon their goods, as no increase can be made in the selling prices. I make no attempt to follow the extremely low cut-prices prevailing down-town, as profits, apparently, are not interesting to the merchants in that portion of our city of homes. As for pushing lower priced goods netting a larger percentage of profit, I do not subscribe to that policy for any one located as I am in a residential section. for the time consumed in extolling the merits (?) of such stuff is more valuable than the extra few dollars gained. When I encounter what appears to be a very good cigar, free from artificial flavors, I stock it in moderate quantity and let it win its way on its own merits. I am guided largely by appearances externally and internally, for we usually make an examination of the contents of a new cigar, and it sometimes pays to have acknowledged cigar experts smoke a sample or two and render their verdicts before stocking the article to any extent.

DOESN'T BELIEVE IN USING THE WINDOW.

5. I never place these goods in the show window, neither do I permit signs to be attached to my store windows and sidewalk, for I wish to emphasize the fact that mine is a drug store first and a cigar store last, so that no mistake can be made in identification.

In conclusion I wish to state that I do not allow my cigar department (or any other department) to interfere with my prescription department's interests, for obvious reasons. I am not ready to be classified in our city directory as a retail cigar dealer or anything else than a retail druggist.

CANARY BIRDS AND GOLDFISH.

By E. B. HEIMSTREET, PALMYRA, WIS.

My best side-lines have been goldfish and canary birds. I buy half a dozen to one dozen canaries at a time. When they come I put half of them in good cages and hang them up around the store; the others in small cages I put in the window.

Besides realizing a fair profit on the birds themselves, I sell a good many cages and considerable bird-seed, cuttlebone, etc. A druggist will be surprised at the sales he will make in these lines if he has the birds. I buy the seed in 100-pound bags, mix it and put it up in pound boxes.

Goldfish I buy in lots of 200 and I sell them at

25 cents each. They also add to the appearance of the store and afford a good profit. They lead to the sale of goldfish food and globes of all kinds. I have handled these things as a side-line for forty years past, and have been well pleased with the results.

I just want to say to those who think of going into it that the best fish in the United States can be bought of Shoup & Heck, of Waldron, Ind., and the best birds of Fred Kaempfer, 88 State Street, Chicago. I speak of this because I have made purchases all over the country, and have found that there is a big difference in both birds and fish. The above firms have always given me the best of satisfaction.

THE KODAK LINE.

By ARTHUR L. CHENEY, MORRISVILLE, VT.

Our chief side-line is made up of kodaks and photographic supplies. We carry the Eastman line and we devote one section of a wall-case in the main store to the goods.

My office windows are located on the main street,

ARTHUR L. CHENEY.

and in these I always have something in the line of cameras or supplies. The goods are sure to catch the eye of passers-by. I also use newspaper space during the season when there is the most interest in photographic work—that is, during the early spring and summer. Another advertising scheme that we follow out is to do developing and printing promptly, and to instruct new customers in the use of both cameras and chemicals.

The Eastman line pays from 25 to 40 per cent,

and it is a full-priced proposition. Every one has to pay the same price the world over.

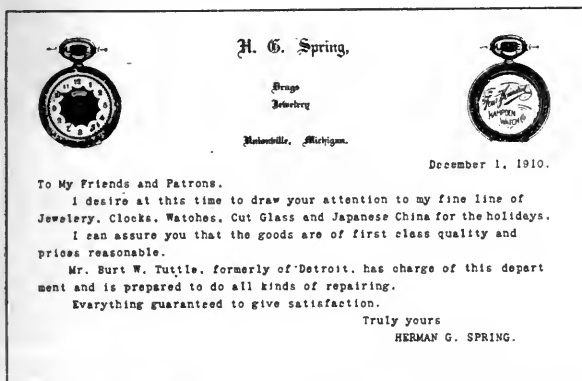

Making a success of the photographic business is dependent on a thorough understanding of the work in all of its details, and on a willingness of the salesman to give frequent hints to assist customers and keep them interested. It must be remembered that the customer who does good work with his camera will use many more supplies than he would otherwise, and he is a constant booster for the business. We have found, too, that to do developing and printing for those who do not care to do it for themselves is profitable. Furthermore, it helps sell the line if you get the work and do it well.

JEWELRY.

BY H. G. SPRING, UNIONVILLE, MICH.

I may answer your questions as follows:

1. Our best paying side-line is jewelry. Unionville is a small town and there is no other jewelry store in the place.
2. We devote to this line our principal show-case as well as a wall-case.
3. In pushing jewelry we utilize the ordinary ad-

Letter sent out by Mr. Spring to exploit his jewelry line at the holiday season.

vertising methods. In addition to this we send out a letter through the mails at the holiday season. The letter used last December I am sending you a copy of.

4. As for the profit yielded by this side-line I may say that it pays my clerk's salary.

5. We do not use the windows for exploiting jewelry except during the holiday season.

6. I would not advise druggists in general to carry jewelry as a side-line unless they had a complete stock of a good quality and in addition kept a watch repair man.

PHOTOGRAPHIC GOODS AND CANDY.

BY W. E. BINGHAM, TUSCALOOSA, ALA.

1. Confectionery and kodak supplies represent our best side-lines.
2. To confectionery we give a whole section of shelving, and we also have a display on a table in the front part of the store. Kodak supplies occupy one entire show-case.
3. In advertising these goods we employ the

W. E. BINGHAM.

booklets and the literature furnished by the manufacturers.

4. On both candies and kodak supplies our profit averages from 25 to 30 per cent.

5. We use the windows very little for these things, and I may say in general that the front of our store is not very well arranged for window displays.

6. When we bought out the Collins Drug Co. we fell heir to their agency of Huyler's confectionery and the Eastman kodak line, and we have found them both winners. We do a very good mail-order business in kodak goods. We do not develop the negatives ourselves, but we arrange with a local photographer to do this work on a commission basis.

CIGARS.

BY WILHELM BODEMANN, CHICAGO, ILL.

1. Our best-paying side-line is cigars.
2. We devote one 10-foot show-case to the goods—a case which opens from the top so that patrons can take their pick without the necessity of hauling over all the boxes.

3. The best advertisement for a line of cigars is in keeping the cigars themselves in good condition, the boxes always in good order, never putting in fire-sale bargains, and always selecting the best possible brands. It pays to handle the best cigars just as much as it pays to give Parke, Davis & Co.'s pharmaceuticals the inside track.

4. As for profits, I may say that we have a good

WILHELM BODEMANN.

box trade and that while the profits vary under such circumstances, the line averages about 30 per cent on the whole.

5. No, we never put cigars in the window. It would render them unfit for sale—except in the Fatherland (Germany), where no cigar is salable unless it is bone dry. My father was a smoker: he used to buy 5000 cigars at a time and put them on the highest shelf in the warmest room!

6. This about closes the case for the defense.

STOCK AND POULTRY FOODS.

By F. C. CAHOW, READING, MICH.

In response to your questions as to our best-paying side-line, I would reply as follows:

1. Stock and poultry foods pay us best of anything outside of the strictly drug line.

2. As for displaying these goods, a very small part of our store is used for this purpose.

3. The methods we employ in advertising this

line are our own personal push and "continual hammering" when farmers and poultry men are in the store, besides the coöperation of the firm whose goods we handle (the Hess line).

4. The profit on the goods is about $33\frac{1}{3}$ per cent in our store. This, of course, depends upon where you are and upon your expenses. It varies from 20 to $33\frac{1}{3}$ per cent.

5. To bring our side-lines before the public we use our window a great deal, also our local paper from four to six weeks in the year.

6. The success of any side-line in a drug store depends upon the demand that may be created and the amount of hard work the druggist wishes to do.

NO SIDE-LINE.

By M. H. GOODALE, BATTLE CREEK, MICH.

I may surprise you by saying in reply to your inquiry that we carry no side-lines in this store—that is, we do not have the lines generally so considered. Our business is comprised almost entirely of drugs, and even our sundry cases are lightly stocked. I may say, however, that we are rather unique in this respect, as the store is the oldest in the city. While our prescription business is very light, we have a heavy drug trade and hardly feel the necessity of branching out in side-lines, especially since we have no room in the store for displaying such lines.

About Antiseptics.—

Professor Delepine says that antiseptics and disinfectants cannot be graded mathematically according to their power, because of the differences even in the same species of bacteria, and also because of differences due to age and environment. Antiseptics may entirely inhibit the growth or development of germs, so that cultures will not produce growth, but if the conditions are properly adjusted these germs will be resuscitated. If used too strong, antiseptics may paralyze germs without killing them, and in too weak solutions active antiseptics, such as phenol, will actually stimulate the growth of the germs. Chemical substances that have the reputation of being strong disinfectants, because they easily cause the death of non-sporing bacteria, are under ordinary conditions practically without lethal effect upon the spores of the same bacteria. The disinfectant power of any agent depends upon the strength of solution, the number and vigor of the germs, the time of contact, the medium in which the germs are contained, and the temperature. In the case of phenol, a dilution of 1 in 10 may kill in one minute, while 1 in 150 is just as effective in one hour, but greater dilutions than 1 in 400 will not kill after very prolonged exposure, and in some instances will stimulate the growth of the germs.

BOARD QUESTIONS ANSWERED.

AN ILLINOIS EXAMINATION.

CHEMISTRY.

(Continued from February BULLETIN.)

10. Give the name of and describe a test for arsenic.

The apparatus consists of a hydrogen generator connected to a calcium chloride tube, which in turn is connected with a piece of hard glass tube about a foot long and $\frac{1}{4}$ inch wide, drawn out at intervals of 3 inches to a diameter of $\frac{1}{8}$ inch. Hydrogen is generated in the flask by the action of sulphuric acid on zinc, and examined for its purity by heating the glass tube to redness at one of its wider parts for at least thirty minutes. If no trace of a metallic mirror is formed at the constriction beyond the

Marsh's apparatus for the detection of arsenic.

heated point, the gas and the substances used for its generation may be pronounced free from arsenic. Both zinc and sulphuric acid often contain arsenic.

After having thus demonstrated the purity of the hydrogen, the suspected liquid, which must contain the arsenic either as an oxide or chloride (not sulphide) is poured into the flask through the funnel-tube. The glass tube heated as mentioned, at one of its wide parts, will show a bluish-black metallic mirror at the constriction beyond. Arsenic spots treated with solution of hypochlorites dissolve readily; antimony spots which are similar are not affected.

MATERIA MEDICA.

1. Define Natural Order as applied to Materia Medica.

Nearly related genera are brought together in groups known as families. Thus we have the Mint Family known as *Sabiatae* which comprise a number of related genera, such as *Mentha*, *Hedeoma*,

Salvia, etc. Still larger groups of related families make up Orders, as the *Graminales*, including the *Gramineae* or Grass Family and *Cyperaceae* or Sedge Family. Orders make up classes and subclasses, as the *Monocotyledons* and *Dicotyledons*.

2. To what family does Fennel Seed belong? (a) What are the characteristics of their family? (b) Name four other plants of the same family.

Umbelliferae or carrot family. (a) The arrangement of the flowers and fruit in compound or simple and generally involucrate umbels. (b) Anise, caraway, conium, and coriander.

3. Distinguish between a root and a rhizome and give an example of each.

The root is that portion of a plant which grows downward into the earth through the force of gravity for the purpose of furnishing a support for the part above ground and to absorb food substances from the earth. A rhizome is an underground stem which sends up foliage branches from the upper surface and sends down roots from the lower surface. A root has no buds; a rhizome has. *Triticum* is a rhizome or underground stem; *belladonna* is a root.

4. Name a leaf and a bark that have cathartic properties.

Senna and *cascara*.

5. From what plant is Opium obtained? (a) Explain the method of obtaining it. (b) Name and give the medicinal action of its most important active principle. (c) Also a salt of the latter having a different action.

Poppy. (a) Opium is obtained by making transverse, oblique or longitudinal incisions in the unripe capsule; the latex which exudes is collected when partly dry and made into a mass. This is then enclosed in a covering of *rumex* or poppy leaves and further dried, subsequently being packed in bags with *rumex* berries to prevent the masses from sticking together. (b) Morphine, a soporific and analgesic. (c) Apomorphine, the salt of an artificial alkaloid made from morphine, is an emetic.

6. What is pollen? How is it useful in plant life?

Pollen is the male element of the plant, a powder that fertilizes the female element. It fertilizes the female flower for the production of seed and thus makes possible reproduction and the continuance of the species.

7. Name two forms of crystals and give an example of each.

Sodium chloride cubical crystals are an example of the simple form; crystals of calcium oxalate in rosette aggregates are an example of the compound.

8. Define Astringent; Sedative; Diuretic; Diaphoretic; Narcotic.

Astringents are agents which produce contraction of the muscular fiber and condensation of other tissues, the first probably by direct irritation, the second by precipitating its albumen and gelatin. They also lessen secretion from mucous membranes. Sedatives are agents which exert a soothing influence on the system by lessening functional activity, depressing motility and diminishing pain. Diuretics are agents which promote the secretion of urine either by raising the local or general blood-pressure and so increasing the renal circulation, by stimulating the secreting cells or nerves of the kidneys, or by flushing the kidneys with water. Diaphoretics are remedies which increase the action of the skin and promote the secretion of sweat. When they act energetically so that the perspiration stands in beads upon the surface, they are known as sudorifics. Narcotics are agents which lessen the sensibility of the individual to the external world. At first more or less excitant to the higher brain and stimulant to the mind and to all the bodily functions, the next stage of their action is one of profound sleep characterized by increasing stupor, and this, if the dose has been sufficient, is followed by coma and insensibility (narcotism). Finally death occurs from paralysis of the medullary centers which govern respiration and the other functions of organic life. In proper medicinal doses, narcotics relieve pain, allay irritation, and induce sleep, thus serving great therapeutic use.

9. What are the medicinal properties of Squill; Jalap; Nutgall; Cantharides?

Squill is largely used for its stimulating, expectorant, and diuretic properties. It may be given with benefit in bronchitis. As a diuretic squill is frequently employed in dropsy. Jalap is a hydragogue cathartic. Nutgall has a powerful astringent effect. Cantharides is employed in medicine externally for the purpose of producing a blister. Internally it is given in very minute doses as a stimulant for the kidneys when these organs are torpid, and also for its stimulant effect on the skin in dry, scaly cutaneous diseases.

10. Give the official name of three drugs obtained from the sheep.

Glandulæ Suprarenales Siccae, Glandulæ Thyroidæ Siccae, Adeps Lanæ Hydrosus.

11. What is the official name of Levant Wormseed? (a) Name its active principle and give the dose and antidote.

Santonica. (a) Santonin 1 grain. Use a stomach pump if called in time. Give a non-oily cathartic and then treat symptomatically.

12. Give the official name, dose, and antidote for the following: (a) Laudanum; (b) Prussic Acid; (c) Carbolic Acid; (d) Fowler's Solution; (e) Corrosive Sublimate.

(a) Tinctura opii, 8 minims. Tannic acid or vegetable astringents, followed by evacuation of the stomach, if the poison has been taken by the mouth. Use a stomach pump at intervals. Give strong coffee. Keep the patient moving. Strychnine antagonizes the respiratory paralysis. (b) Acidum hydrocyanicum dilutum, 1½ minims. If in time to do anything, give cobaltous nitrate. Per and proto salts of iron with magnesia are used. Application of cold to the chest and spine, the internal administration of chlorine water and aromatic spirit of ammonia, with inhalations of ammonia gas, have been employed with some success. (c) Phenol, 1 grain. Magnesium or sodium sulphate is the chemical antidote. The condition is treated by applying external heat, the administration of demulcents and opium to relieve the pain, and by giving stimulants to prevent or overcome shock. Give large quantities of any soluble sulphate. (d) Liquor potassii arsenitis, 3 minims. The antidote for arsenic is hydrated ferric oxide, freshly prepared by precipitating a solution of ferric chloride with sodium carbonate—or as the official ferric hydroxide with magnesium oxide. (e) Hydrargyri chloridum corrosivum, 1/20 grain. The antidotes are albumin, magnesia and milk. The white of one egg with each 4 grains of the poison forms the albuminate, which must be at once evacuated by emesis or the stomach pump.

13. Give the chemical antidote for the following: (a) Phosphorus; (b) Nitrate of Silver; (c) Nitric Acid; (d) Sugar of Lead; (e) Oxalic Acid.

(a) Potassium permanganate. (b) Sodium chloride solution. (c) Alkalies, as sodium carbonate or bicarbonate, magnesia or chalk. (d) Sodium or magnesium sulphate. (e) Calcium carbonate or hydrate (as lime-water, chalk, whiting, wall-plaster, in water).

(To be continued.)

DOLLAR IDEAS.

The editor of the BULLETIN will pay \$1 in cash for every practical idea accepted for this department. What is wanted are good formulas, dispensing kinks, book-keeping suggestions, business plans, advertising schemes, new soda drinks, and everything else of a novel and useful nature.

AN INGENIOUS SHELF SUPPORT.

Emil Reyer, South Bend, Indiana: Having devised a shelf support useful in window displays, I am sending sketch and description of it. The device may be of service to others. It can be made with little trouble from boards sawed from packing boxes. The supports, of course, can be built of such size as to suit the individual convenience.

Those made for the store where the writer is employed are 1 by 6 by 6 inches. Saw the pieces from the board, observing the size desired. Then saw out a section of a width exactly equal to the

thickness of board shown in sketch A. This slit extends into the piece just one-half the height of the support. The two pieces for each support are made alike and can then be slipped together as shown in sketch B.

The pieces should then be stained, using a color that harmonizes with the wood. These supports can be used for glass shelves, or package goods, etc. As they cost little more than the time to make them, one can have quite a number of various sizes. When not in use, slip the pieces apart and they can be stored away in very little space.

USING A DELIVERY BASKET AS AN ADVERTISEMENT.

Edwin R. Mohler, Philadelphia, Pa.: Every bottle or package that leaves the store is delivered by our porter in a neat covered basket. Upon two sides we have painted these words "Rehfuss Drugs," in heavy black letters. It does not fail to attract

people's attention as the young man passes along the street. The basket is one of the best ads. for your store that is possible, as it impresses upon people both one's name and business. It has also been the means of increasing our business. People send in

orders for goods or prescriptions by handing them to the porter as he happens to pass by their house. That is a daily occurrence with us and is entirely due to those two words on the basket.

A NEW METHOD OF MAKING ROSE-WATER.

H. S. Carpenter, Detroit, Mich.: This is by no means a U. S. P. product, but is every bit as satisfactory and considerably cheaper to manufacture:

White rose extract	½ ounce.
Boric acid	1½ ounces.
Aqua	1 gallon.
Purified talc	2 ounces.

Mix and filter. Mix the boric acid and talc with the white rose perfume and gradually rub up this mixture with warm water. Pour it into a filter and add water through the filter to make up the required amount.

We find that the boric acid has a small healing and antiseptic value, which is very desirable in the hand lotions, rose-water, glycerin, etc.

By this method one can make a gallon of rose-water for about twenty cents, and a pretty good article at that.

DRUG-STORE SKETCHES.

ALGERNON MEETS HIS WATERLOO.

By CLEO C. LONG.

"Me selling perfumery indeed!" remarked Algernon from behind the fragrant case of toilet goods. "Why, I don't know lilies with the lid off. I'm the boy prescriptionist of the Middle West, I am, and what do you think of his nibs for putting me behind *this* counter?"

"Proba'ly thought it might teach you some scents," remarked the pretty cashier, with a wink at her cash register.

"Wow! She certainly did put one over that time," admitted Algernon. "But honest to goodness, Gert, I don't know this stock. What's the matter with Miss Grace? Sick, yes?"

"Sick, yes. All you gotta do I s'pose is to read the labels on the goods. You can read printing, I presoom?" suggested the cashier. "It's likely to be a busy day in cosmetics, too," she continued cheerfully. "The new show across the street, 'Gushy Girls,' is just crowded with chorus loidies. I saw 'em go in for rehearsal. They're always dandy toilet customers."

"They're some on the soda fountain, too," proudly announced the angel-faced boy who presided over that department. "I've chalked up a new drink for their special benefit—'Gushy Girls' Guzzleit.' Guess that's a poor sign, huh?"

"What cosmetics do they buy, mostly?" asked Algernon, with anxiety. "Pew-fume, powder, rouge, and all the outfit? I know exactly what to say if a Gushy Girl comes in and asks me for powder."

"What?" asked the soda boy, biting readily.

"Ah, powder? Certainly, madam," said Algernon, assuming his most salesmanlike manner. "Face, gun, or bug?"

At this juncture it became evident that the rehearsal across the street was over, for groups of chorus girls came out through the stage entrance, and several of them promptly crossed the street to the Pillpenny Pharmacy and settled themselves on the stools that lined the soda fountain.

"Feels like lunch time to me, girls," said a languid blonde, casting aside her cheap fur collar with all the air of a grande dame at Delmonico's. "Hot

chock'let for mine and plenty of suds on top, Kiddo."

"How many wafers goes with the chock'let?" asked another. "Gee, only two? Say, girls, I put it to you, ain't this the close town? 'Member that swell fizz counter in Louisville where they gave you three styles of wafers—plain, Graham, and frou-frou? And two of each kind. That was some food garage, wasn't it? What's in the sandwiches?"

"Say, look girls, pipe the sign, 'Gushy Girls' Guzzleit!' Me for that whatever it is. I'll be game. What's it like, Gastong?"

In view of the fact that it was a cold day, and that the girls were obviously seeking sustenance rather than froth, the genius of the soda fountain made a lightning change in his mental picture of the dainty thus advertised.

"Best stuff you ever tasted," he announced with conviction. "It's a hot tomato bouillon (he was very careful to say *to-mah-to*), rich and creamy, with a dash of whipped cream on top, and, er—about four wafers to a portion."

"That's the stuff."

"Me for that."

"Set her up, little one," chorused the chorus, and in a few minutes the girls proceeded to make good the title of the dainty dish set before them.

In the meantime Algernon was not happy. He was never happy unless occupying the stage center, and the chorus girls seemed unaware of his existence. They sipped their bouillon, and nibbled their crackers, and jollied the soda boy, assuring him of their entire approval of his concoction. They also expressed their intention of taking meal tickets on his counter for the remainder of the week, and of putting the rest of the chorus girls wise to the excellence of his cuisine.

Finally Algernon could stand it no longer. As the girls rose and approached the cashier's cage with their ten-cent checks, he seized an atomizer and began to spray the atmosphere with violet perfume.

"U-um, where's the good smell comin' from? Oh, girls, I gotta have some cold cream—wait a minute," said she who wore a bright red feather in her Tyrolean hat. "Have you got Smearem's cold cream?" she asked, approaching the toilet goods with dignity.

"Certainly, madam. A shaving cream, is it? I beg your pardon! That's what I use it for, of course," confided Algernon, who had no suspicion of down on his countenance. "A massage cream,

I intended to say. Now here is an article we find especially in demand among all the leading actresses, madam. Only last week Olga Nethersole bought a pound jar of this. She said that it was undoubtedly the most auspicious compound she had ever applied to her countenance. Removes paint equal to turpentine—better in fact. Perfectly delicatessen and non-partisan. Guaranteed not to become discordant in any climate."

"You put up an elegant line of talk, but it don't mean nothin'," said the girl. "Nix with the Nethersole story, and anyway I want Smearem's cold cream. Have you got it?"

"One moment, I'll look again. 'Smearem's,' 'Smearem's'—well, here's Smugnut's and Snitch Hazel and Goose grease—"

"Aw, add up your talk, kid, add up your talk," urged the Red Feather. "What's the answer? Have you got Smearem's Massage Cream or have you not? 'Cause that's what I use on my map, Olga to the otherwise notwithstanding!"

"I deeply regret to inform you," admitted Algernon, "that for the moment Smearem's Massage Cream is out of stock. But we have one of the most complete lines of toilet water and perfumery ever instigated. Try this, for instance. Isn't that a swell article? The most perfect, permeating, pervasive and permanent perfume ever permitted to grace a lady's—er—pergola. Redolently speaking, it is designed to suggest all the odors of Araby. It is a bouquet, ladies, not a single scent. A blend, a harmonious inhalation of half a dozen delicious fragrances, suggesting now the lily or the rose, again the violet or carnation, or perchance the—"

"Onion?" suggested one of the girls as Algernon paused for inspiration. "Say, Poicy, you sure are the most wonderful little press agent that ever shuffled the syllables. You've missed your calling, all right, but when it comes to a show-down I'll bet I'm there with the stuff as swift as you are. If you think because we're in the chorus that it's up to you to get gay and string a line of talk that gives a girl the earache you've missed your cue. And let me tell you, horizontally speaking, that your remarks are exceedingly eppycack, and if a lady can't buy a jar of cold cream without being treated to a loose shower of lingo it's time to put the rollers under somebody, and it might as well be you."

Whereupon the chorus girls swept out in a body, leaving a crushed and shaken Algernon, who for once had not a word to say in reply.

LETTERS.

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

HINTS ON PRACTICAL PHARMACY.

To the Editors:

Here are a few suggestions along the line of dispensing:

LINIMENTUM TEREBINTHINAE ACETICUM N. F.

Stokes's Liniment, which is well known to my professional brothers, often thickens and hardens on standing if kept for some time. When a lucky 5 or 10 cent call for the liniment is received, the drug-

LEO TARTAK, PH G.

gist, in order to dilute the liniment so as to be able to pour it out from the stock bottle, adds some turpentine, or water, or a mixture of both.

To overcome the thickening one should use the yolks of the eggs only and a small part of the white. Of course fresh eggs are required, not stale ones containing hydrogen sulphide in excess. By removing part of the whites and using only the yolks of the eggs in the preparation, one obtains a product that will never thicken on standing.

SYRUP HYPOPHOSPHITES COMPOUND U. S. P.

When this preparation is made according to the official formula it often ferments on standing with

the formation of a green coating on the top of the syrup. I have found by experience that the addition of 5 per cent of glycerin will prevent fermentation. The container should be kept closed.

CRETA CAMPHORATA.

There are many methods in preparing camphorated chalk for the hand sales. Some rub camphor with alcohol in a mortar and then add the chalk. Others use spirit of camphor, incorporating it with the chalk powder, and many other ways.

A very good and easy method is to place a block of camphor in the stock bottle and then fill it with the powdered chalk. This yields a very fine product owing to the sublimation of the camphor, and it is very easily done.

TINCTURE OF LARKSPUR.

There are many different ways of making tincture of larkspur, but no matter which method is used, there are always difficulties in filtering. To overcome such trouble strain the seed through gauze or other medium.

Saturated solution potassium iodide (1:1) often darkens on standing. Free iodine is liberated, rendering the drug unfit for dispensing. To prevent the presence of uncombined iodine add a small quantity of sodium hyposulphite, $\text{Na}_2\text{S}_2\text{O}_3$, from 0.5 to 1 per cent. The therapeutic action of the solution is unaffected.

ELIXIR AROMATICUM.

To prepare U. S. P. simple elixir, a purified talc is required as a clarifying agent. The filtration is very slow, but if pure carbonate of magnesia is used in place of the talc the liquid will pass through the filter in a very short time, much faster than the U. S. P. talc process.

LEO TARTAK, PH.G.

New York, N. Y.

SOME PRACTICAL POINTERS ON TOILET SOAPS.

To the Editors:

The discussion on toilet soaps in the January BULLETIN was timely and should prove helpful to the trade. Toilet soaps are one of the most profitable lines handled by the druggist, if given care and attention. The following remarks may assist you in securing from druggists who have made a success of the soap trade a few pointers in taking care of toilet soaps (toilet soaps well taken care of are half sold!) which may help others to build up a still better soap trade.

If there is a shipment of one line of goods more than any other that it is a pleasure to open up and check off, it is toilet soaps. Before you have the cover of the first case off, you are greeted with a pleasing perfume that soon finds its way through the store, cellar, or basement where you unpack freight shipments. As you go further in unpacking the goods, and open up the original packages of one-dozen cakes, or four boxes, you get the individual odors themselves—carnation, rose, violet, or lilac, as the case may be. Then, too, the boxes and wrappers are very attractive. Manufacturers spend considerable time and money in getting up "fetching" packages and odors. But if the soaps are carelessly stored and handled they soon lose their selling qualities. You will find it a good plan to keep some of these soaps in their original packages, and store them away in a cool, dry place free from light.

Before opening up a shipment of toilet soaps it is advisable to consider the best way of disposing of the greater part of the shipment in the shortest time possible—that is, when the odors are good and the packages have not lost their attractiveness. This can be accomplished by preparing your trade a week or two in advance for a soap sale, or advertising for a soap week. But do not take out of the original packages more of the soaps than you feel reasonably sure you can sell during the sale, as the stock that is left over soon loses its attractiveness and odor. If you are using a window for a soap display, do not keep the goods there longer than three days, and have the window as cool as possible and free from direct sunlight.

It is also a good plan, when dressing a show-case with toilet soaps, to avoid filling it up with all kinds of soaps. Make the principal part of the display with a very attractive 10- or 15-cent line, and open up as few of the really expensive soaps as possible. The latter soon take up the cinnamon or clove odors from the cheaper soaps. Be sure, too, to keep the medicated products away from the others—particularly the tar and carbolic soaps.

Did you ever take a number of remnants of perfumes and mix them? As a rule the scheme is not a success, and so it is with soap perfumes—the soaps lose their individual odors if a show-case is filled with a big assortment. As there are quite a number of well-known and advertised soaps that you are called on to handle, it may be found advisable to confine your buying outside of these to a

good stock of a small assortment, rather than to a small quantity of a big assortment. A good quantity of only one line, well displayed, is more salable than the same quantity of an assorted line; it is more striking to the eye.

Many druggists leave the big sale of five-cent lines to the grocer. This is a mistake, for unless your trade is very high class, or unless you have a large prescription trade, you can buy and sell just as cheaply as the grocer, and you know more about the chemistry of soaps than he does. You will be surprised at the turnover during a year of the 5-cent business if you go after it. Boarding houses and hotels are the big users of such soaps, and usually buy a six months' supply at one time. Much the same applies to toilet paper and fly poisons. Don't let the grocer have this business. When your turnover is large, and you get quantity prices, it means more frequent buying and your stock is kept fresh.

Take care of the 5-cent lines; keep them well displayed and ticketed. The white-milled soaps, when unwrapped, soon chip, lose luster, and become unsalable. The cheaper, unwrapped, transparent glycerin soaps, on the other hand, collect dust very quickly. Keep them before your customers, but keep them clean.

Keyes, Manitoba.

HE BELIEVES IN MAKING THE PURCHASER OF LIQUOR TAKE HIS MEDICINE.

To the Editors:

The States have different laws regarding the sale of liquors by druggists or open saloons. However, this State (South Dakota) has local option, and when a town or township votes no license the druggist cannot sell liquors for any purpose whatever except on a prescription from a physician in the county wherein the drug store is located. Now I am unfortunate enough to be located in a small dry town without a physician. I therefore cannot sell liquors, but the way the stuff is shipped into the town is a caution! Five- and ten-gallon kegs are as common as if there were two saloons in the town. One day alone not long ago there were unloaded from the local freight train 60 gallons of whisky and brandy!

Now I have found that since this is a dry town the people will go a few miles farther to a town where they can purchase liquors to do their trading.

I wish to say that because I am unable to sell liquors it has driven customers and business from my door. I am not making this statement to create the idea that I want to be a rum-seller, but as long as liquors are official in the U. S. P., and people want them for good legitimate purposes, let there be a law that a druggist can sell them regardless of whether the town or State is voting out the saloons.

But make it an affidavit law—*i.e.*, have an affidavit for the purpose stating therein that the liquor is intended for medicinal purposes, giving the amount and kind of liquor, and declaring that the purchaser wants it for himself or his family, and have the purchaser sign and swear to this. Put a limit of one sale a day to any one person. Then when the purchaser violates his affidavit by using liquor for other purposes than specified in the affidavit, let the law get him and get him hard instead of giving the druggist the worst of the deal. I say, give the purchaser a touch of the law.

A law of this kind, along with a few convictions, would soon teach the people who want liquor that they could not do as they please with liquors bought on an affidavit, and that they would have to take the blame instead of the druggist. Such a law would soon make the selling of liquors by druggists as innocent as anything else sold in the store. While the law could be abused I do not think any druggist would go out and solicit liquor sales; but let the enforcement of the act be left to the peace officers and then see to it that they do their duty. It would not be long ere this howling about the booze-selling druggist would be a thing of the past!

Brentford, South Dakota.

H. G. RAVELING.

THAT INCOMPATIBLE PRESCRIPTION—TWO LETTERS ON THE SUBJECT.

To the Editors:

I have been interested in the following prescription printed on page 43 of the January BULLETIN:

Solution of ammonium acetate.....1 ounce.
 Spirit of nitrous ether.....4 drachms.
 Potassium iodide25 grains.
 Syrup of squill.....1 ounce.
 Syrup of tolu, enough to make....4 ounces.

Sig.: 1 drachm every two hours.

Permit me to point out that two of these ingredients are, as I have stated on previous occasions, trouble makers, and the dispenser should bear them in mind. I refer to spirit of nitrous ether and

potassium iodide. Even if the first should not be acid it will be decomposed, since three of the other ingredients in the prescription have an acid reaction—solution of ammonium acetate, syrup of squill, and syrup of tolu.

Some time ago I was called upon to dispense practically the same prescription. I notified the physician of the incompatibility, explained that iodine would be set free, and suggested to him that he order spirit of ether instead of spirit of nitrous ether. This was done and the trouble was entirely overcome.

OTTO RAUBENHEIMER.

Brooklyn, N. Y.

To the Editors:

The prescription contributed by R. S. T. to page 43 of the January BULLETIN can be compounded in the following manner, and a presentable mixture, showing no trace of free iodine, will be the result:

Mix the sweet spirit of nitre and solution of ammonium acetate, and then add sufficient carbonate of ammonia to insure the solution being alkaline (a few grains will suffice). In this dissolve the potassium iodide and lastly add the syrups of squill and tolu.

The incompatibility between sweet spirit of nitre and potassium iodide or bromide can usually be overcome by neutralizing the nitrous acid in the sweet spirit of nitre with potassium bicarbonate. In this case, however, it is correct to use the ammonium salt. The nitrous acid is converted into a nitrite of the alkali.

PETER M. WILKIE.

Missoula, Montana.

HE IS ENTHUSIASTIC ABOUT STAMP-VENDING MACHINES.

To the Editors:

Let me say in reply to your letter of inquiry that I have two stamp-vending machines which I have had in operation for a little over a year. They are wonders. To begin the story (and I'll let you dig out the best of it if you desire to publish it) I had been selling about \$50 or \$60 worth of stamps a month—just about enough to keep us running for them a good part of the time. And fifty per cent of the stamp customers only came just inside the door! One trip down an eighty-foot store to get the order, another trip to the register to get the stamp, and usually still another to get change! That meant a walk of at least 150 feet in order to wait on every stamp customer.

I got hot and threatened to throw out stamps entirely. Then the Automatic Service Company came along with their proposition, and I installed two machines. Yes, I did lose a customer for about four weeks, but she was like the cat, "she came back." At first she got very warm—called the deal a swindle, etc., went to a groceryman up the street, recited her tale of woe, and then requested him to supply her with stamps. "Why," said he, "this is not the post-office. Uncle Sam pays a corps of men and has built a building just three blocks down the street where he sells stamps."

Cold comfort!

The two machines are patronized quite liberally, and they require no labor on the part of either myself or the clerks, except occasionally to show some one how to operate them. Our profit in fourteen months has been \$22.03, a like sum going to the stamp-machine company. My customers, after a little explanation, have come to see the justice in the extra charge made, and now, after a trial which I believe to be amply sufficient, I would not think of taking the machines out.

There are, I think, eighteen of the machines in operation in this city, doing a more or less lucrative business. Our returns, I am informed by the agent, are heavier than any others, and yet we are close to the post-office.

CHARLES L. MCBRIDE.

Kingston, N. Y.

A SIMPLE METHOD FOR TESTING THE COLOR OF GRANULATED SUGARS.

To the Editors:

During a talk with Professor Scoville not long ago we discussed the difference in color in granulated sugars, and the professor pointed out to me the difficulty the pharmacist or manufacturer often meets with in selecting a sugar which will make a colorless syrup. The U. S. P. does not give any test for color, only directing that the sugar must yield a colorless syrup. Therefore to know by the sugar itself what the resulting syrup will be seems really what is wanted in a test.

I happened to know a very simple method which will reveal the color of white granulated sugar in a few minutes, and Professor Scoville, after he had tried it out, urged me to publish it for the general benefit.

In the first place I will call your attention to the fact that a sugar made up of large clear crystals will make in most cases a clearer syrup than can be pro-

duced from the smaller grains. Furthermore, it seems to me that the method of manufacturing simple syrup as given in the U. S. P. offers a chance of caramelizing the small particles of sugar which may come in contact with the dry and therefore overheated surface of the dish, and it needs only a little caramel to give a tint of yellow to the syrup. May not dissolving in boiling water, and a careful removing of the scum if such develops, do just as well?

But now for the test: Put a little pile of granulated sugar, say 25 Gm., in a white porcelain evaporating dish, so that it appears as a flattened cone. Then allow from a pipette 5 Cc. of distilled water to run carefully and little by little around the base of the heap. While the water draws slowly up to the top of the pile, keep on emptying the pipette until the whole heap is soaked—always running the water around on the base. If the sugar is off color—either blue, yellow or gray—this will show in the place where the water comes ultimately together, leaving either a large dot or a ring of the peculiar color involved. A comparison of the color, which is clearly distinguishable against the white of the dish, may be made with a standard approved sample if necessary to settle any doubtful case.

L. G. LEHR.

Analytical Laboratory, Parke, Davis & Co., Detroit.

WHAT DO YOU THINK OF THIS FORMULA FOR A TOILET CREAM?

To the Editors:

During the last several months I have noticed in your valuable journal, particularly in the department of "Queries," several formulas for toilet lotions, creams, etc. While most of them differ somewhat from one another in their component parts there is nevertheless a good deal of similarity. For some time I have prepared a toilet lotion after the following formula:

Quince seed	2 ounces.
Boracic acid	1 ounce.
Rose-water	8 ounces.
Distilled extract of witch-hazel....	8 ounces.
Glycerin	8 ounces.
Alcohol	8 ounces.
Tincture of benzoin.....	1 ounce.
Oil of rose.....	20 minims.
Carbolic acid	20 minims.
Water, enough to make.....	1 gallon.

Place the quince seed in a gallon bottle, add the water and

let stand 24 hours, shaking occasionally. Strain through muslin. Dissolve the carbolic and boric acids in the glycerin with the aid of gentle heat. With this mix the tincture of benzoin, and add this mixture in several portions to the quince-seed mucilage, agitating the bottle well after each addition. Finally add the oil of rose dissolved in the alcohol, and mix the whole well.

This makes a nice, creamy, non-sticky preparation. I put it up in 3-ounce bottles and retail at 25 cents. I always wash the quince seed well before macerating.

I have found this product to be very satisfactory, and I would like to have the opinion of your readers on it. I may add that I have been a subscriber to the BULLETIN OF PHARMACY for several years, and I consider it a valuable acquisition to my library.

Milton, N. C.

R. L. DIXON.

A PHARMACIST IN THE PANAMA CANAL SERVICE.

To the Editors:

From time to time there are sent to your magazine for publication freak notes and orders. Having received one recently that is the most complex and confusing I have ever seen, I am enclosing it. It was received from a Hindoo who could not talk English, and there was no one to act as interpreter for me. I dispensed cough syrup on a wild chance, and in a few days the man came in with the empty bottle and I refilled it for him. He bowed, smiled, and went his way.

As a druggist in the service of the Isthmian Canal

Commission, my experiences have been both varied and amusing. There are some forty-five nationalities represented here, and the demands are more varied even than the number of countries represented. One is called upon to dispense medicine to people who say that they have "A giddiness in the head and the bowels humbugging," that they have "A pain in the back and want some embrocation to anoint it."

Space will not permit me to go into much detail about my experiences. The work is pleasant and the hours short. There is a shortage of druggists in the service here, and any one who would like

some good experience, and can let liquor alone, can do well here.

Candidates should apply to the Isthmian Canal Commission, Washington, D. C., so that the applications will not be delayed or made out incorrectly.

With best wishes to the BULLETIN.

Gatun, C. Z., Panama.

"APOTHECARY."

A PUZZLER.

To the Editors:

I submit a traced copy of a prescription filled in the course of business a little while ago.

I think the first and third ingredients would puzzle some of my brother pharmacists. The first article, "Tr. ferri pomat.," is tincture of iron and

Tinct. Ferri pomat 3 1/2 fl
" Cinnamon 3 ss
" opii crocata 3 i
sh. sh. 3 times daily 10
drops

bitter apple. The third article is "Tinct. opii crocata" or tincture of opium and saffron.

Neither of these is ever used now. It is the first time I have dispensed either for years.

Beverly, Mass.

CHESTER H. KNOWLES.

SELLING THERMOMETERS.

To the Editors:

Here is a little scheme by which we sold a dozen and a half thermometers. We suspended a 25-cent thermometer by means of a white cord in the center of the front door. Just above it we had a sign reading: "Don't ask your neighbor how cold it is to-day." Underneath the thermometer we simply printed the price as follows—"25 cents." These signs were painted on the window-glass itself by the use of zinc oxide paste.

Just inside the store, on a table, we had a display of various thermometers, and there was a third collection of the goods on a show-case near the wrapping counter. During the cold weather we feature thermometers in this way, and we seldom fail to sell an interested customer a high-grade thermometer.

WALTER A. BADE.

Corvallis, Montana.

IT MAKES A DIFFERENCE WHO DOES IT!

To the Editors:

I notice that in the department of "Letters" of the January BULLETIN my friend J. C. Hagar has been complimenting you about the "General Essays" in the BULLETIN. I second his motion, but I would amend it by suggesting that you not only use ten-point type for these articles, but raise the size to twelve-point. After reading your essay entitled "Punishing the Innocent" in the January BULLETIN, and giving it a chance to settle well, I reread it. Now I would ask you to tackle this theme: "What one man can do, and is praised for it, another does and is damned for it." That's a variation of "punishing the innocent." I have heard association leaders criticize each other and they were praised for it. I have heard men of the rank and file do the same thing and get h— for it! They have been called traitors and excommunicated. Now what's the difference—can you tell me?

Chicago, Ill.

W. BODEMANN.

LET OUR READERS TELL.

To the Editors:

I submit a copy of a prescription for which I charged \$3.50. The customer said the last time he had had it filled he had paid only \$1.50:

Strychnine sulphate.....16 grains.
 Sol. arsenic chloride.....3 ounces.
 Quinine sulphate.....640 grains.
 Tr. of iron,
 Glycerin, aa.....1 pint.
 Aqua, q. s.....4 pints.

Will you please tell me how the druggist could possibly put up this prescription for that price?

Birmingham, Ala.

B. R. E. LEE.

[NOTE BY THE EDITORS.—We shall be glad to have our readers express their opinions about this price. What do you get for a half-gallon of such a mixture? We can't see how a druggist can retail such a solution on prescriptions at the rate of \$3.00 a gallon. Let us hear from you.]

To the Editors:

I congratulate you on the continued beauty and value of the BULLETIN under your editorship!

Boston, Mass.

IRVING P. FOX,
 Editor of "The Spatula."

* * *

To the Editors:

Can't do without the BULLETIN.

Rutherfordton, N. C.

W. O. WATKINS.

THE SERVICE DEPARTMENT

In this new department of the BULLETIN the market wants are indicated of those subscribers who are not able to find what they desire, and who are anxious to be put in touch with sources of supply. In some instances we have brought inquirer and manufacturer together, but in all cases it would pay other manufacturers to follow up the clues here given. We shall be glad to furnish the full name and address of any inquirer to producers or distributors who write us for this information. Readers of the journal on their part are earnestly requested to send us a description of their wants; we are anxious to make this department as valuable as possible to them all.

A Course in Optometry.

34. B. O. J. wants to take up the study of optometry by mail and is anxious to prepare himself thoroughly and properly for the fitting of glasses and other work which comes under this general head. He believes this might be made a very desirable professional side-line by the pharmacist. He wants to know what institutions are prepared to give a home course of study.

Replating Soda Spoons; Imitation Glass Labels.

35. J. P. C. & Sons would like to get in touch with some one who can replate old soda spoons and similar articles of this character which have begun to tarnish.

They also want to know where they can procure labels for shelf bottles which are in the nature of imitations of glass labels but cheaper. They think they have seen something of the kind advertised but cannot locate it.

Machinery Wanted.

36. W. Bros. Manufacturing Co. write as follows: "We are trying to secure a machine for grinding wood shavings for the making of a sweeping compound, and our object is to get in touch with manufacturers of special grinding machinery of this character. Such machinery we are informed is used by the drug manufacturers in grinding up minerals, roots, herbs, etc."

Tablet Machines.

37. The H. N. B. Co. wants to be referred to manufacturers of tablet machines. It desires to know where it can obtain the best tablet machine on the market—one that will make all sizes of tablets and in various forms.

Labels for Canned Goods and Cans Themselves.

38. H. J. M. desires to be placed in communication with manufacturers who make labels for canned goods—such labels as are used for canned corn, tomatoes, peas and the like. They would also like to be put in touch with manufacturers of cans of various kinds.

Fiber Boxes.

39. C. A. F. would like to hear from manufacturers of

boxes made from fiber or from waterproof paper of some kind.

Drawer Pulls.

40. B. F. M. wants to buy 125 drug drawer pulls. He prefers those made of oxidized copper bearing the names of drugs. He is building a new drug store, and he is also in the market for a nice awning for the front.

A Card Cost System.

41. The G. Drug Co. is anxious to establish a card cost system in its business and it does not know just where it can obtain what it wants. It would be glad to hear from manufacturers who can render advice and supply the equipment.

Book Racks.

42. B. & Son are desirous of finding out where book racks may be procured for cloth-bound and paper-back books. They are establishing a circulating library in the store and want something in which to keep the books.

A Line of Jewelry.

43. R. L. W. is in the market for a good, reliable line of jewelry, but he does not want to deal with any firm that is not entirely responsible. He assures us that fakirs need not apply.

Souvenirs for an Opening Day.

44. M. E. L. writes as follows: "I intend to open a new drug store in the future and I would like to be put in touch with concerns which make a specialty of selling premiums or souvenirs for opening and anniversary days. I have thought of match safes, calendars, and other things, but most of these have been worked overtime, and in fact it is pretty hard to pick up anything that is novel at a reasonable price."

A Special Container for a Pile Remedy.

45. T. C. writes as follows: "Could you tell me where I could get those hard-rubber tubes that screw onto collapsible tubes, to be used in connection with a pile remedy? The hard-rubber tubes are about one inch and a half long and are screwed onto collapsible tubes; the former is inserted into the rectum and then one gently presses on the collapsible tube and the salve comes out of the sides of the hard-rubber tube. If you know where they are made kindly let me know and oblige."

Advertising Service Wanted.

46. G. S. S. writes: "Can you put me in communication with concerns which prepare advertising matter for druggists—ads. which may be used in the daily papers?"

Manufacturers and Dealers in Castor Oil.

47. The A. H. R. Co. would like to hear from the principal manufacturers and dealers in castor oil in the American market.

Tieman's Soluble Blue.

48. T. J. M. is very desirous of knowing where Tieman's Soluble Blue is made. He would like to be placed in communication with the factories where this or similar substances are produced.

QUERIES.

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

A Compound Laxative Elixir.

H. G. H. wants to get up a compound laxative elixir of which each fluidextract will contain:

Senna	5 grains.
Podophyllum	1 grain.
Rhubarb	2 grains.
Cascara sagrada	5 grains.
Magnesium sulphate	20 grains.
Sodium sulphate	5 grains.

H. G. H. writes: "We used fluidextracts of the first three drugs, aromatic cascara, added some licorice, and produced a mixture with a more pronounced salts and senna taste than the original product which our physician friend had in mind. He said the original had very little odor and only a slight licorice taste, and that the taste of the product did not remain long in the mouth. Can you suggest a good working formula? I might add that the physician wants to get the product at \$2.75 an imperial gallon. By using a good quality of fluidextracts, however, we are unable to meet this figure."

Our friend will readily appreciate the fact that to match a flavor or appearance from a description is a most difficult matter, even though the description be clear and lucid, as in this case. We would certainly expect that a preparation containing about 50 per cent of salts would have a very pronounced salt taste, and when the other ingredients and solvents bring the volume up to three-quarters of the final amount, there isn't much room for sweetening or flavoring. Another difficulty is that of getting the podophyllum resin to remain in solution in the weakly alcoholic liquid—a consideration which seems impossible on the face of it. A strongly alcoholic fluid will precipitate the salts, and a weakly alcoholic one, with the salts in solution, will precipitate the resin.

Acids are the best disguise for salts; but they cannot be used if licorice is to be employed to cover the taste. Our correspondent does not state what form of licorice he used. Has he tried the liquid extract of licorice of the British Pharmacopœia—or some similar preparation? The more licorice you can get into the mixture, the better the salts will be covered, but of course the stronger will be the licorice flavor, and this appears to be contrary to the purpose of the original preparation. It also adds to the cost, which he already has overstepped.

Our correspondent has gone at the problem in the right way. We can suggest no improvement on that. If he will now compare his product with the original preparation in specific gravity, extractive, relative precipitates with barium chloride, etc., he may get a clue to the problem. We are unable to suggest more than this.

Some Points About Greaseless Creams.

O. D. R. asks for a formula for a greaseless cream and inquires: "What would be the result if you added enough sodium carbonate to the stearic acid to make an alkaline product, then added enough to just leave it acid, then just enough to make it neutral?" Also, "How much 28-per-cent ammonia would be required to neutralize 1 ounce of stearic acid, to make stearate of ammonium?"

O. D. R. will find on another page an article which deals with this subject and includes several formulas for greaseless creams. We will refer him to this for the formulas.

A study of such formulas will show that these creams are not intended to be alkaline or neutral, but to contain a large excess of stearic acid. To this end only enough alkali is used to saponify a portion of the acid, and the rest is held as an emulsion in the mixture. An alkaline product would not be acceptable as a skin cream, since its tendency would be to roughen instead of to soften the skin. Even a neutral cream would have little if any softening effect, and it would be difficult to secure a smooth cream in a neutral form except by reducing the sodium stearate to very small proportions; this would make it of little value as an application to the skin. In these creams stearic acid takes the place of the oil and wax of the ordinary cold cream, and this is what lubricates the skin.

It (stearic acid) is more readily absorbed than are mineral or vegetable oils, hence the term "greaseless," which is not a true designation, though the products are not greasy in the way that cold cream is.

An alkaline cream would not only be roughening to the skin, but since salts throw soaps out of solution, the mixture would tend to become granular and separate.

A neutral cream would be translucent if thin enough to spread easily, and would be jelly-like instead of creamy.

An acid cream is what practically all of the formulas give, but they are not "just acid," but decidedly acid.

To neutralize 1 ounce (avoirdupois) of stearic acid will require 94 grains of 28-per-cent ammonia water, or about 104 minims.

Carbolized Solution of Iodine, N. F.

W. E. R. Co. asks: "What can we use to deodorize carbolized solution of iodine N. F. so as not to interfere with its medical properties, or is there any other similar preparation that we could use instead?"

The odor of Boulton's Solution (carbolized solution of iodine) is due mainly to the carbolic acid which it contains. There is no way of deodorizing this without interfering with its properties.

The quality of the glycerin used will have something to do with the odor of this compound. Commercial glycerin frequently contains acrolein in combination, or fatty acids which remain concealed until they are liberated by heat, or acids or oxidizing agents. In the preliminary decolorizing of the iodine solution some of these ill-smelling bodies may be liberated and so develop an unpleasant odor in the mixture. A purer glycerin would remedy this.

There is no similar preparation which can fully take the place of this. Whether a combination of decolorized tincture of iodine, phenol, glycerin, and water would have the same

or similar properties, we do not know. You might try a mixture of 9 Cc. of decolorized tincture of iodine, 5.5 Cc. of liquefied phenol, 165 Cc. of glycerin, and water enough to make 1000 Cc., and submit a sample to your physicians for trial. This will contain about the same amount of iodine as Boulton's Solution.

Red Hair-oils.

A. J. D. writes: "Please furnish me with a formula for a red hair-oil."

Here are three formulas:

Castor oil	2 ounces.
Oil of bergamot.....	120 minims.
Oil of lavender.....	30 minims.
Oil of rosemary.....	30 minims.
Oil of rose geranium.....	15 minims.
Alkanet root.....	60 grains.
Alcohol	14 ounces.

Dissolve the oils in the alcohol, add the alkanet root, digest two or three hours, and filter. The color may be deepened or lightened by adjusting the quantity of alkanet root.

Oil of benne.....	1 pint.
Cumarin	1 grain.
Oil of lemon.....	12 minims.
Oil of bergamot.....	60 minims.
Alkanet root.....	a sufficient quantity.

Dissolve the cumarin, oil of lemon, and oil of bergamot in the oil of benne, and add sufficient alkanet to give the desired color after macerating a few hours; then strain. Olive, almond, peanut, or white cottonseed oil may be used in place of oil of benne. Or, if preferred, liquid paraffin may be employed.

Cocoanut oil.....	3 ounces.
Castor oil.....	4 ounces.
Alcohol	8 ounces.
Oil of cinnamon.....	4 minims.
Oil of bitter almond.....	2 minims.
Oil of lavender.....	30 minims.
Oil of bergamot.....	90 minims.
Alkanet root.....	a sufficient quantity.

Melt the cocoanut oil and add it to the castor oil and alcohol. Warm until the liquid is clear, add the other oils and alkanet root, and macerate a few hours until the color is right; then strain.

Nail Bleaches and Nail Polishes.

O. S. asks for formulas for cuticle ice, nail bleach, nail polish in cake form, and nail polish in paste form.

"Cuticle ice" is a new term to us. Perhaps some of our readers can help us on this. We are not familiar with it.

For a nail bleach, a solution of oxalic acid in water acts well. Half an ounce of oxalic acid in 12 ounces of water is a good proportion. Hydrogen peroxide may also be used.

A nail polish may be made of any colorless polishing agent, such as chalk, infusorial earth, clay, zinc oxide, tin oxide, etc. Tin oxide is a frequent ingredient, though whether it has any advantage over other and cheaper polishing powders we do not know.

A typical combination is as follows:

Lead oxide	1 ounce.
Tin oxide.....	3 ounces.
Carmine	20 grains.

This forms a base for a powder, cake, or paste. For a cake form, make it into a stiff (somewhat crumbly) paste with mucilage of tragacanth, press into molds, and dry.

For a paste, mix with enough of a mixture of paraffin 1 part, and white petrolatum 4 parts, to give the required consistency. In the latter case a better color will be secured by employing an ammonia solution of carmine rather than

the dry carmine, and using just enough to give the required color.

As suggested before, a very satisfactory paste can be made from white infusorial earth, mixed with a little kaolin or talc, colored with carmine solution, and made into cakes with mucilage of tragacanth, or into a paste with paraffin-petrolatum. Another base for making the paste, which has some advantages in spreading, is a mixture of 1 part white wax and 3 parts cottonseed oil. This is softer and spreads a little more smoothly.

A Poor Prescription.

E. D. D. asks what should be the appearance of the following prescription as to color, and he also wants to know whether it should be filtered or dispensed with a shake label:

Morphine sulphate	1 scruple.
Zinc permanganate.....	1 grain.
Water	4 ounces.

Inject as directed every three hours.

Morphine salts and permanganate are incompatible—permanganate of potassium even has been recommended as an antidote to morphine poisoning. This prescription, from the pharmaceutical standpoint, should not be dispensed at all. Since pharmaceutical considerations do not always prevail in such cases, however, it becomes necessary to dispense it as written. The permanganate will be reduced, and the result is usually a muddy-brown mixture. We would advise not filtering it, but dispensing it as a shake mixture.

Lilac Toilet Water.

M. P. D. Co. writes: "Please publish a formula for a lilac toilet water."

The following formula was published by W. L. Scoville about eight years ago:

Oil of bergamot.....	3jss.
Oil of lemon.....	5vj.
Terpineol	3iv.
Oil of orange.....	3ij.
Oil of rosemary.....	3ij.
Tincture Siam benzoin.....	3ij.
Water	3xij.
Alcohol, to make.....	1 gallon.

Dissolve the oils and tincture in seven pints of alcohol, gradually add the water, and filter.

The Standard Formulary gives the following:

Essence of tuberose.....	5iv.
Essence of orange flowers.....	3j.
Oil of bitter almond.....	1 minim.
Tincture of civet.....	3ij.
Alcohol	Oij.
Water.....	q. s.

Dissolve the essences, oil, and tincture in the alcohol, cool to about 60° F., and gradually add water until a faint milkiness remains. Then filter.

Compound Vanilla Extract with Tonka, Vanillin, and Coumarin.

"Subscriber" writes: "Please supply me with a formula for vanilla extract to contain, besides vanilla beans, tonka, vanillin, and coumarin flavoring. I should like a formula which can be sold in gallon quantities to compete with the well-known brands."

Cut and grind 6 ounces of vanilla beans and 1 ounce of

tonka beans, mix well with $\frac{1}{2}$ pound of granulated sugar, and add 1 quart of alcohol, 4 ounces of glycerin, and enough water to make a gallon. Macerate two weeks, then filter and wash the filter and contents with enough water to obtain a gallon of fluid. To this add $\frac{1}{4}$ ounce of vanillin and 15 grains of coumarin, then enough compound tincture of cudbear, N. F., to obtain a rich color. Such a product should not be labeled "Extract of Vanilla," but "Extract of Vanilla and Tonka Compound," and the presence of vanillin and coumarin should be stated on the label.

Two Questions.

The C. Drug Co. writes: "Could you give us a formula for shoemaker's wax?"

"Does alcohol lessen the action of formaldehyde as a preservative when the latter is used in an embalming fluid?"

A shoemaker's wax may be made after the following formula:

Melt 40 pounds of rosin and add 4 pounds of rosin oil and 4 pounds of coal-tar oil. Boil the mixture until a portion of it on cooling is plastic and dough-like, then add 2 pounds of chrome yellow and 2 pounds of prepared chalk. Mix well and cool in molds.

So far as we know alcohol does not lessen the preservative action of formaldehyde. Commercial formaldehyde solutions always contain some methyl alcohol, the proportion of which varies. For embalming or preserving purposes

alcohol itself is of much value, and is more likely to increase the formaldehyde action than lessen it.

Camphor Cream.

F. H. E. wants a formula for making camphor cream such as is used in barber shops. The following is a typical formula:

Melt $\frac{1}{2}$ ounce white wax and add $9\frac{1}{2}$ ounces of white petrolatum. When the whole is fluid remove from the heat and stir in 90 grains of camphor, 90 grains of menthol, 2 ounces of zinc oxide, and 3 ounces of boric acid. Stir until the mixture stiffens, then run through an ointment mill. If a mill is not available the zinc oxide and boric acid should be just rubbed smooth with a little of the petrolatum mixture, and the rest worked in after it has cooled.

Removing Tattoo Marks.

S. F. Pharmacy.—These are said to be removable by the application of a paste of salicylic acid and glycerin. A compress is applied over the paste, and the whole secured with sticking plaster. After about eight days the paste is taken off, the dead skin removed, and the application of the paste repeated (as a rule, three times).

Applications of cotton wadding, soaked in chloroform, and kept in place by means of a bandage, have also been recommended.

A QUARTER-CENTURY CELEBRATION.—Oscar W. Smith, manager of the New York branch of Parke, Davis & Co., gave a dinner at the Hotel Astor on the evening of February 1 to commemorate in a fitting manner the completion of twenty-five years of continuous service in the house. The guests comprised General Manager E. G. Swift and several executives from the home office in Detroit, the department chiefs in the New York office, and representatives from the branch in Baltimore over which Mr. Smith presided for several years prior to his promotion to the New York management. Dr. Jokichi Takamine, the well-known Japanese chemist, was also one of the guests and speakers. Mr. Smith was presented with several gifts from his friends in the house, and the evening was replete with interest, good humor, and pleasant congratulation.

GENERAL ESSAYS.

THE CANCER OF SUSPICION.

BY HARRY B. MASON.

What a lot of cruel suspicion there is in the world! How often are people's motives questioned! How frequently are their actions misinterpreted! How repeatedly are their reputations injured by a sort of social Vigilance Committee which acts summarily and which gives the defendants no chance to appear in the moral court at all!

Nearly everybody, as I have said in a previous essay, seems to act on the perverted and cruelly unjust assumption that people are to be deemed guilty until they have proved their innocence, and since they are given little or no chance to prove it, and are condemned and punished without a hearing, the charge of guilt is fastened on them securely. One incident that "looks bad" is usually enough to set tongues wagging: "I didn't think *he* would do that, did you? I *am* surprised. I always thought he was above such things."

The second time a seeming offense against convention or ethics or morals is committed the tongues wag still more actively, and the man's reputation already begins to hang in the balance: "Well, I declare, I *did* hope I was wrong before. He has always been such a good man. But I guess he is like all the rest. You can't trust men, anyway."

Oh! the cruelty of Dame Gossip!

And women are not the only sinners. I have seen the Cancer of Suspicion gnawing at the vitals of men quite as rapaciously. I have seen them question the honesty or the decency of their fellows with quite as much injustice.

Few things do more harm in the world than suspicion. Confidence is the basis of our financial and commercial system—every one knows that. Every one knows that financial panics and industrial depressions have largely resulted from a lack of business confidence. Destroy this and you make every business man suspicious—you make every one afraid of every one else—you pull out the supporting columns and bring the structure crashing to the ground. If it were not for arousing political feeling (a thing I have no desire to do) I would dwell somewhat on two political leaders, one in each of the great American parties, who have of late years done much to foster suspicion, destroy confidence, awaken prejudice, and undermine our national prosperity, with the result that our business interests have been seriously injured. Both disturbers are now temporarily if not permanently under a pall, and a restoration of business confidence, and consequently of industrial progress, is slowly manifesting itself as a direct result.

But I have spoken of business confidence only to pass on to the statement that social confidence is quite as essential to our well-being and happiness. The man or the woman who inserts suspicion and doubt in among the meshes of the social fabric is doing as ruinous a thing as the noisy agitator who destroys the confidence of business men in one another and in the country. Confidence and trust comprise the very warp and woof of the social as of the industrial structure, and they cannot be injured without serious results.

As for me, I prefer to believe that most people mean to do the right and the square thing. I prefer to believe that there is more good than bad in the average man or woman. Anyway it makes me happier to think so: it gives me more pleasure in the companionship of men and women if I can trust and respect them. I do not want to be constantly on my guard. I do not desire to be watching my friends and acquaintances out of the corner of my eye to see if they do not trip occasionally and perhaps fall to the ground. If they *do* fall I want to pat them on the back, tell them it was an accident, and urge them to go ahead again with courage and confidence. It is time to convict and punish them in the court of public opinion when they have been proved guilty, and they should be deemed innocent until then. This is the fundamental principle of criminal law. Why shouldn't it be the fundamental principle of social law?

I have always noticed, too, that if people know you trust them they will try hard to be worthy of it. Put them on their honor and in nine cases out of ten they will be faithful. Doubt them, and, since they have nothing to lose, they will measure down to the doubt.

Eight or ten years ago, perhaps longer, the "honor system" of conducting examinations was installed at Princeton University, and immediately the naive and inexperienced faith of the faculty was made the subject of irony and satire from one end of the country to the other. Did the professors not know what students were by this time? Did they not realize that, given a free hand, every last one of them would "crib" his way through the examination with flying colors? Where had the unsophisticated members of the faculty been living all these years that they did not have a better understanding of human nature?

But what was the result? Cheating at examinations at once stopped absolutely! If memory does not serve me falsely, only one man continued his "cribbing" practices and his fellows were so indignant at the disgrace he had brought on himself and on them that they exposed and punished him with revengeful thoroughness!

What is the secret of the marvelous success Judge "Ben" Lindsey has had in reducing juvenile crime in Denver? Simply this: that he has trusted his "boys;" that he has placed confidence in them; that he has put them on their honor. And his "boys," as boys always will with few exceptions, have responded nobly. The Henry George Junior Republic and similar institutions and movements here and there throughout the country have been conducted on the same fundamental principle, and everywhere boys have measured up to the confidence reposed in them. It has never failed to bring out their best qualities and make men of them.

Do let us be charitable. Let us banish suspicion from our minds. Let us be unwilling to believe and pass along the first bit of evil gossip we hear of people. Appearances have injured many a reputation just as circumstantial evidence has hung many a man. We cannot always know the real facts; we cannot read one's motives; we cannot usually judge accurately of circumstances that may look suspicious—so let us be lenient. Let us have faith in people; it will make us happier and it will make them better.

To indicate how deceptive appearances often are let me tell the story of a reputable citizen who left four umbrellas to be repaired. At noon he had luncheon in a restaurant,

and as he was departing he absent-mindedly started to take an umbrella from a hook near his hat.

"That's mine, sir," said a woman at the next table.

He apologized and went out. Later in the day, when he was going home in a street car with his four repaired umbrellas, the woman he had seen in the restaurant got on the car. She glanced from him to his umbrellas and said:

"I see you had a good day."

It is scarcely necessary to say that the policy of charity and trust does not at all mean that either commercial crime or social offense shall be condoned. We must uphold our private and our public standards with jealous and rigid resolution. We must punish offenders with sure and speedy determination. But let us be certain first that they *are* offenders—that's the point. Let us not go about wearing the blue glasses of Suspicion and seeing the color of guilt fastened upon everybody and everything within reach of our vision.

ADVERTISING.

THE MANUFACTURER AND HIS DISTRIBUTOR, THE DEALER.

In a recent speech delivered before the Chicago Advertising Association on the advantages of advertising in trade papers, Mr. John A. Tenney, of the firm of Hoyt & Tenney, drug and medical paper specialists, brought out the following facts:

The most vital factor in a manufacturer's success is distribution, and with few exceptions this means the retailer, but in a great many advertising campaigns he is ignored entirely. The agencies many times say: "Create the demand and the dealer will be forced to stock your goods." They have repeated this so long that the advertisers believe the dealer is a man to be forced and bullied. It is true that they may force some articles on the dealer by such methods, but they cannot force them off his shelves. Make no mistake—the dealer controls the situation in his home town and can sell your goods or keep them under the counter.

The dealer has a great deal of self-respect and does not care to make himself a tool for some manufacturer in pushing the sale of his goods without being asked for his coöperation.

Assuming that the product is right, the first step in an advertising campaign, to my mind, is to interest the dealer and make him a loyal representative, so that he will assist in creating the demand when your general advertising campaign starts.

There are three ways to reach the dealer—the trade paper, the letter, and the salesman. You will find the trade paper and the letters the less expensive and most profitable.

Dealers want to know whether the established price will give them a good profit, whether the manufacturer intends to prevent price cutting, and whether the advertising will be continuous.

You can gain his good-will through his favorite trade paper for the reason that he has confidence in it, and if he will tell your story for you to his own customers it will make your work of introducing your product very much easier.

Not only that, but your trade paper advertising will do this for you:

It will gain the dealer's good-will.

It will cut the work of your salesmen in half, and they can double their sales, as the sale is half-made before your salesmen call.

It will teach the dealers the talking points of your product and how to create the demand.

It will make dealers familiar with your name and location.

It will build up the prestige of your firm.

It will inspire confidence in your firm and your methods of doing business.

It will go behind the doors that are locked to your salesmen.

The trade paper is the logical and economical way to reach

JOHN A. TENNEY.

the retail dealer. If you have anything to tell him, talk to him straight from the shoulder in his trade paper and the returns are bound to come in.

I wish to state that I believe more advertising failures are caused each year by goods being extensively advertised before the matter of *distribution* has been properly attended to than from any other cause. These failures will be reduced when the advertising agents begin to use trade and class papers a little more, and when the prospective advertisers refuse to be blindfolded by having other minds do their thinking for them.

COLLEGE BUILDING WILL COST \$70,000.—Construction soon will begin on a large dentistry and pharmacy college building in Portland, Oregon, to cost \$70,000. This structure is to meet the rapidly growing requirements of the North Pacific College of Pharmacy and the North Pacific College of Dentistry, which institutions have already far exceeded their room capacity on Couch and Fifteenth Streets. The new college building is to have ground space of 100x100 feet and will be located at East Sixth and Oregon Streets. The college has owned for some time a half block at this point, and will have as soon as the contractors can get the work under way there, a large, modern college building on the south half of this half block.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., APRIL, 1911.

No. 4.

THE

BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	-	-	-	\$1.00 per year
Foreign countries,	-	-	-	1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.	-	-	MONTREAL, QUE., CAN.
378 ST. PAUL STREET,	-	-	LONDON, ENG.
19 AND 20 GREAT PULTENEY STREET, W.,	-	-	SYDNEY, N. S. W., AUSTRALIA.
125 YORK STREET,	-	-	

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY.

LEGISLATIVE MATTERS.

Something like 40 State legislatures have been or yet are in session this year, and the usual grist of measures affecting pharmacy in one way or another has appeared. It would be hopeless for us even to enumerate all of them. We understand that death has been meted out to the liquor bill desired by the Michigan Retail Druggists' Association and discussed by us last month at some length. In Pennsylvania a good deal of interest has been excited by the customary form of bill which would compel all proprietary medicines and "own-make" goods to bear the full list of ingredients on the label. In California a bill has been introduced by pharmacists themselves which among other things would subject druggists to the risk of losing their registra-

tion certificates by the payment of prescription commissions to physicians—an evil which seems to be particularly rampant in San Francisco.

In both Pennsylvania and Illinois the pharmacists are still working over the drafts of pharmacy acts to be introduced. The Pennsylvania pharmacists cannot agree on the medical dispensing feature and are divided into several camps over different provisions of the measure. In Illinois the present draft provides for the graduation prerequisite, but there seems to be more or less dispute over the proposition to abandon the principle of apprentice registration in the present law. Another thing that has disturbed the dreams of the Illinois pharmacists is the recent opinion of the Attorney-General that State boards like that in pharmacy cannot keep and use their receipts. All money must be turned into the State treasury—and of course after that is done it is pretty hard to get it out again for the purpose of enforcing the law and paying board expenses.

* * *

MONEY FOR THE PROCTER MONUMENT.

A movement has now been under way for three or four years to raise a fund of \$20,000 for the purpose of erecting a monument to the memory of William Procter, Jr., on the grounds of the Smithsonian Institution in Washington. What has given life and purpose to the plan is the desire on the part of American pharmacists to have their profession recognized in this public manner at the National Capital. Professor Procter, having been the "father of American pharmacy," and having rendered so many pioneer services to the calling, is deserving of the honor, but apart from the personality of Procter himself, the movement is entitled to the support of pharmacists everywhere who love their calling and who desire to see it dignified.

At the last annual meeting of the Maryland Pharmaceutical Association it was reported by Dr. J. F. Hancock, chairman of the A. Ph. A. Committee on the Procter fund, that of the \$20,000

desired, only about \$4000 had so far been raised. Henry P. Hynson thereupon remarked that the Washington monument, erected to the memory of the immortal George, was built by money raised from the sale of policy tickets—strange as this may sound. Money for the Lee monument in Richmond, on the other hand, was secured by selling certificates of membership in the Lee Monument Association at \$5. Mr. Hynson did not favor the policy idea, of course, but he was inclined to think that if a plan could be devised of issuing stock or membership certificates in a Procter Memorial Association, the money could be raised much more quickly than by the method so far followed. If these certificates had a value, say, of \$1 each, he was inclined to think that every pharmacist might buy as many as he had members in his family.

This plan seems to us a good one. Dr. Hancock replied that some such method had already been discussed by the Memorial Committee, and that during the present year something along this line might be decided upon.

* * *

TIT FOR TAT IN ENGLAND.

In Great Britain there is far more counter-prescribing by pharmacists and dispensing by physicians than in this country. Every physician who can afford it, indeed, apparently has a dispensary with an assistant in charge of it, and there seems to be very little brotherly feeling between the two professions. Not long since the organized medical profession induced the government to undertake an investigation of the extent to which prescribing was done by the "chemists."

The inquiry was conducted by 1600 medical officers of health, who furnished particulars concerning their own districts. The report based upon the information supplied by these medical officers constituted a remarkable attack upon pharmacists. It stated that "chemists" do not know, or only imperfectly know, the diseases they treat, and that consequently their prescribing is for the most part superficial and directed only to the symptoms, and in some instances cases are referred to doctors only in time for them to give a certificate of death. Infectious diseases, such as measles, scarlet fever, whooping-cough, diphtheria, and smallpox, were stated to be frequently overlooked by chemists, and outbreaks of infectious diseases were attributed to this cause. It was alleged that children's skin diseases were

wrongly treated, and that this sometimes necessitated a prolonged absence from school.

The treatment of infants' diseases by chemists, according to this report, has some bearing on infant mortality. Phthisis and cancer in the early stages are sometimes through improper treatment aggravated, and in many cases become too advanced for effectual medical or surgical treatment afterward.

Under the circumstances it is not surprising that pharmacists were up in arms and that they promptly resolved to ask for an investigation into the conditions under which the storage, compounding, and dispensing of medicines are carried on by doctors. It seems only reasonable to expect the government will be willing to make such an inquiry out of a sense of fairness and justice, for one profession is just as culpable as the other in encroaching upon his neighbor's preserves.

* * *

VENDING LAW KNOCKED OUT.

More or less consternation has fallen upon the N. A. R. D. camp by the recent State supreme court decision in Illinois declaring the itinerant vender law unconstitutional. The court held in the first place that since there are no restrictions in Illinois on the sale of proprietary medicines, the itinerant vender could not properly be prevented from selling them. It declared in the second place that a license fee of \$100 a month was practically prohibitory, and that the effect of the statute was to give the druggists of the State a monopoly without in any way conserving the health of the public. If we remember correctly, a similar law in the west, possibly in Minnesota, was declared unconstitutional two or three years ago for the second reason now advanced in Illinois. The Illinois law has heretofore been considered a model by the N. A. R. D. people, and its duplication in other States has been urged for several years. The decision comes just when the sessions of several of the State legislatures are drawing to a close, and when similar measures are pending here and there. The problem will evidently have to be tackled from a different angle, but it seems rather late to do anything now until another year.

* * *

SATIRIZING EARLY CLOSING.

Out in Spokane, Washington, a movement has been started for the purpose of bringing about early and Sunday closing by the druggists of the city. This has evidently interested the newspapers

somewhat, and we are reproducing a cartoon which appeared recently in the Sunday edition of the *Spokesman Review* of Spokane, together with the verses which were printed under it:

Oh! father, dear father, come home with me now,
The clock in the steeple strikes ten.
You've broken the Sabbath and mother's poor heart,
And baby won't know you again!

Oh! what do we care for the sale of a sponge,
A tooth-brush, a stamp or a pill?
Our Sundays without you are awfully sad
And mother, I fear, will be ill.

The lawyers are saying there's grounds for divorce,
And I'll have a stepfather then.
So lock up the drug store each Sunday at 12,
And make us all happy again.

* * *

THE HALLBERG FUND.

A gratifying number of responses have been made to the request of the American Pharmaceutical Association that contributions be made to the Hallberg fund for the liquidation of the \$3500 mortgage on the family residence in the interest of Mrs. Hallberg and her young son Carl. The Chicago Veteran Druggists' Association, always an ardent advocate of every humanitarian movement, generously contributed \$500. The contributions from individuals have been fairly numerous, and the local committees of the A. Ph. A. are planning a systematic canvass in the interest of the fund. Everybody realizes that Professor Hallberg devoted himself with complete surrender to the welfare of American pharmacy. To such an extent was this true that he neglected his own private interests, and therefore left his family without proper protection. Under the cir-

cumstances it is only meet and proper that pharmacy should pay Professor Hallberg's family the debt which it owed to the Professor himself.

* * *

N. A. R. D. MATTERS.

The Executive Committee of the N. A. R. D., holding its regular mid-winter meeting in Chicago, seems to have tackled the work of the organization with customary vim and energy. Plans were laid for a continuation and enlargement of the regular activities, and two new features were decided upon. A free employment bureau will be established, and a "greater legal department" will be created. So far as the latter is concerned, Judge Errant will render assistance to local and State associations with reference to litigation, legislation and the like. He will also supply information regarding subjects of this kind to dues-paid individuals.

The Executive Committee likewise decided upon the inauguration of a vigorous membership campaign. The field force of organizers will not be increased for the present, but an aggressive method of going after new members by mail will be worked out by an expert and will be prosecuted with great vigor and determination. The slogan is to be 10,000 new members in 1911!

The annual meeting will be held this year at Niagara Falls. Milwaukee, Rochester, and Cedar Point were considered, but Niagara was finally selected because of its central location, desirable hotel rates on the American plan, and the offer of several desirable features gratis.

* * *

DON'T LIE ABOUT EXTRACTS!

These are bad days for flavoring extracts which are not properly labeled. In the last annual report of the Dairy and Food Commissioner of Connecticut we find mention of a large number of prosecutions where lemon, vanilla and other flavoring extracts were discovered to be out of harmony with the State law. So-called "Extract of Lemon" was variously condemned because it contained no lemon oil at all, or because the content of oil was too small, or because the product was artificially colored. "Extract of Vanilla" was deemed illegal usually because it was misbranded, preparations made of vanillin and coumarin not being properly labeled. There is no objection under most State laws to products of this kind if the titles are not misleading and dis-

honest. Among other flavoring essences falling under the ban of the law were peppermint, orange, ginger, and the like. It pays to tell the truth these days!

* * *

**WELL! WELL!
WHAT NEXT?**

Here's a brand new proposition! Down in Boston, where some of the latest ideas in public reform have been adopted, the reformers want a municipal drug store! Not long since a good old-fashioned "town meeting" was held in the City Hall for the purpose of enabling the citizens to tell the mayor and Council what they thought they ought to have. The municipal drug-store idea was advanced on the ground that the public ought to have an opportunity of getting medicines at all hours, and at the cost price—or at least as near to that figure as possible. Mayor Fitzgerald jollied the citizens along by approving the general principle involved, but declared that to establish such an institution was not within the power of the City Council. He suggested that the matter be taken up with the State Board of Pharmacy. The latter body will of course grant the request right away—yes?

* * *

**DRUG-STORE
"EXPERIENCE."**

There has been considerable difference of opinion in Pennsylvania over the interpretation of the phrase "drug-store experience." The Board of Pharmacy has been inclined to insist that this literally means experience in a real drug store and not in a hospital. The attorney-general of the State, however, has recently ruled that a candidate who had his experience in a government medical dispensary had complied sufficiently with the requirements of the law. This decision seems to us sound, as we declared editorially some months ago.

* * *

**NINE MONTHS FOR
SELLING "DOPE!"**

The Pennsylvania Board of Pharmacy, in its commendatory enforcement of the anti-cocaine law, has succeeded in putting into jail for nine months one Benjamin Ashmead, who is, startlingly enough, himself a government inspector of drugs! The testimony showed that Ashmead had been buying

cocaine for years from a large chemical house. Over 400 ounces of the stuff have been traced to him by the detectives of the Board. The jury rendered a verdict of guilty without leaving the box, and Judge Carr evidently thought that Ashmead needed a little compulsory leisure in which to think the matter over.

* * *

**COUNTER-
PRESCRIBING.**

An interesting judgment has just been rendered in Canada against a druggist. It seems that a customer asked a clerk for a bottle of a particular proprietary liniment, whereupon the clerk told him that he had something which would prove to be much more effective for the purpose. The patron purchased it, but upon using it he found that it caused him severe pain. He promptly brought suit, declaring that he suffered for two months from the effects of the liniment, and insisting that he ought to have about \$500 to make things square. In the meantime the owner of the store had died, and his heirs had become the defendants. The plaintiff won the case, but the judge reduced the damages to \$150 with costs.

* * *

**READ BEFORE
YOU SIGN.**

Every once in a while some druggist will nibble at a hold-up proposition of one kind or other. Several pharmacists in Rochester, N. Y., have recently been caught by a manufacturing concern in Ohio. They thought they were signing an order for a line of new specialties on commission, but when it was too late they discovered that they had actually signed notes which the manufacturing firm had discounted! The old injunction, "look before you leap," might well be paraphrased thus: "Read before you sign."

* * *

The Philadelphia College of Pharmacy, in addition to its regular course in commercial training, has inaugurated a special course of weekly lectures given by outside speakers. The special course was opened on March 20 by the editor of the BULLETIN OF PHARMACY, who was invited to address the second and third year men on the subject of business records.

EDITORIAL.

RESTRICTIONS ON THE PRACTICE OF PHARMACY.

Some very good people in pharmacy fear that legislative and other restrictions on the practice of the calling are becoming altogether too great in number and too intolerable in character. Liquor laws, anti-narcotic statutes, carbolic acid ordinances, pure food and drug acts, and measures of various kinds seem to be crowding one another in rapid succession. So keenly was this felt that at the Pittsburg meeting of the N. A. R. D. in September last the cry was often heard: "If this thing keeps up what freedom will be left to us? What right will remain to conduct our business as honorable men? How long will it be before nothing can be sold over our counters except on a physician's prescription?" More recently we have seen a page and a half fulmination in one of the pharmaceutical journals uttering the same cry and forecasting the day when physicians' prescriptions would be required for every petty transaction in the drug store.

We confess that we do not take quite so pessimistic a view of the outlook. It must be understood that these are days of statutory restrictions. What might be called individual liberty is being surrounded more and more by the State and Federal governments with limitations of one kind and another. More and more the interests of the individual are made to give way to the interests of the community, and a healthy type of socialism is permeating our government structure. A higher standard of morality and honesty is being demanded, and this demand is seeking expression in legislation. What the Federal government is striving to do with the trusts and the railroads is merely another form of a wide-spread movement which has for its basic inspiration a desire to give better protection to all the people.

Unfortunately such movements and such legislation have a tendency to confuse the innocent with the guilty. If a few members of any calling violate the laws of honesty, ethics or square dealing, it is too often assumed that the entire calling is guilty of the same practices and that every member of it must be so tied up with restrictions as to compel

morality in the interests of the public. The good men must therefore be surrounded with restrictions because the bad men abuse their privileges, and there is no easy way of separating the sheep from the goats. What is true of individuals is true of the different States themselves; because North Dakota or Nevada has loose divorce laws, because New Jersey has loose corporation laws, the other States are threatened with a certain loss of their independence by the demand of the "new nationalism" that greater powers be centralized in the national government in order that the weak links in the chain may be removed.

We in pharmacy will suffer no greater restrictions than are imposed upon men in every other calling, and we shall be wise if we move with the tide instead of in opposition to it. We ought not, it is true, to accept every hobble which may be placed around us; we must be alive to protect our best interests; but we must show our good faith and disarm suspicion by proving an eagerness to correct our own evils, to punish our own malefactors, and to approve of every legal restriction which may be necessary for the betterment of the community as a whole.

A MOVE TO POPULARIZE THE PHARMACOPOEIA AND EDUCATE THE PEOPLE IN STANDARDIZATION.

In reading "The Autocrat at the Breakfast Table," we were struck to run across a mention of the Pharmacopœia. So seldom is this word found in general literature! But our wonder ceased upon remembering that the author, Oliver Wendell Holmes, had been a physician and for thirty years was a professor of anatomy in the Harvard Medical School.

Why is it that the Pharmacopœia is never mentioned in lay literature? Isn't it unfortunate? Wouldn't it be better if people generally were familiar with the nature and purpose of this book? R. D. Lamie, of the Dairy and Food Department of Michigan, believes that there ought to be a concerted effort among druggists to familiarize the public with the meaning of the term "U. S. P." Every one should know what that authority stands for. It would be asking too much of the N. A. R. D. to request an appropriation of, say, \$3000 for ads. in papers like the *Saturday Evening Post* to carry on

an educational campaign. Nor would that be necessary.

What druggists can do is to have the letters "U. S. P." on the labels of packages wherever the contents permit it. Let proprietors in their individual advertising, in their circulars and newspaper announcements, have some mention of pharmacopœial standards. This is perfectly feasible. If a druggist observes the official requirements, what is to be lost in mentioning the fact? Once make this movement general and it would not be long before the Pharmacopœia would be far better known than it is now. The book would come to stand for something in the lay mind.

What is to be gained by a popularization of the Pharmacopœia? A lot. It would raise the druggist a peg or two in the esteem of the masses. It would put a stop to the habit of judging a drug store, not by the quality of the goods, but instead by the lowness of the price. A scrupulous druggist may sell an essence of peppermint containing ten per cent oil. But if his competitor chooses to prepare a seven or even a three per cent essence, there is nothing to prevent him, providing he indicates the strength on the label.

The trouble is just here. People have not been educated to read the strengths of drugs on the label. "U. S. P.," "N. F.," and percentage compositions in general are things unknown to the lay mind. What is the result? A. sells a spirit of gaultheria containing the official amount of oil, 5 per cent. B. has only 3 per cent of oil in his preparation and can therefore charge less. Obviously A. suffers by the seeming disparity of prices. All this is very unjust to the man who observes the U. S. P. requirements. A woman may pay 75 cents for a pint of vanilla extract in one store and later buy the same quantity for a half dollar from another. At once she concludes that she is getting more for her money from the second fellow. But the differences of drug strength may more than account for a disparity of 25 cents in the price of the two vanillas.

There should be some way of acquainting customers with the variable strengths of vanilla extracts. This could be accomplished by a campaign of education among the people on the subject of pharmaceutical standardization. If retail automobile agencies can talk about standardization of the parts in an automobile in their public advertisements, why can't a retail druggist proceed along

parallel lines? Let the man who sells strictly U. S. P. goods tell the people so in his advertising. The more men and women know about official standards, the better it will be for druggists who observe them.

CYANIDES OR PTOMAINES—WHICH?

There has been an alarming number of ptomaine poisonings in the past few years. Curses have been heaped upon canned goods. Cold storage has been denounced as one of the worst evils affecting humankind, and recourse has been taken to the authorities at Washington to stop the sale of decomposed products.

Hardly a day goes by that the papers fail to chronicle a case of alleged ptomaine poisoning, and of course it is usually attributed to mock turtle soup, oysters, or canned meats, and with that passed over.

Now we hear that many of these cases, instead of resulting from ptomaines, are due to our old enemy potassium cyanide. The polishes used to clean coffee-pots and other articles of silver often contain this dangerous salt. After cleaning the silverware, hotel employees are not careful to rinse each container repeatedly in fresh water before drying it, with the result that cyanide is ingested with the food. The hotel guest drinks it in his coffee. A pretty note, indeed!

While this explanation may satisfy our scientific curiosity, it is poor consolation for the bodily suffering. Fortunately, new devices are being introduced to clean silverware in which the cyanide is completely eliminated. Zinc plates do the work. Not only do they take the place of toxic agents, but they remove also the necessity of scouring the silverware. A few rinsings and all the tarnish is removed. The silverware takes on a bright luster without becoming a carrier of poison.

But what of the druggist who makes and sells a silver polish at a good profit?

AN INVITATION.

The photographs of druggists' homes reproduced in the BULLETIN lately have attracted a great deal of interest, and we should be glad to have other contributions for the series. If you have a residence that you are proud of for either its beauty or its home-like attractiveness, we should be happy to receive a picture of it.

THE HALL OF FAME.

THE SUCCESSFUL PROPRIETOR OF FOUR STORES.

The remarkable pharmacy recently established in the Hotel Astor in New York City has attracted a great deal of attention. We are showing a full-page view of it elsewhere in the present issue of the

FREDERICK K. JAMES.

BULLETIN, and a mere glance at the picture will suffice to show that this pharmacy represents the latest achievement in the perfection of drug-store art.

In the meantime it is of general interest to note that Frederick K. James, the proprietor of the Astor Pharmacy, has three other prosperous establishments in New York City. The original store, opened in 1890, is at 8th Avenue and 44th Street, and here Mr. James retains his office and keeps his headquarters. Of the other two stores one is at the corner of 46th Street and Broadway, and the second at the corner of 8th Avenue and 113th Street. In addition to these large and growing establishments, Mr. James also has a laboratory where he makes something like 300 toilet articles and household remedies, many of which are sold on the open market.

Mr. James comes honestly enough by his efficiency in the drug business. Beginning in 1883 with James A. Hart of Ossining, N. Y., he afterwards

attended the New York College of Pharmacy and was graduated from that institution as an honor man in the class of 1889. He began for himself the next year, and since then his expansion has been gradual and continuous. He is a member of the New York College of Pharmacy, the Alumni Association of the College, the New York State Pharmaceutical Association, and various other pharmaceutical societies. He is a member also of the Ancient Lodge F. & A. M., No. 724. Finding time for recreation amid so busy a life, he is an enthusiastic member of the Fox Hills Golf Club.

The new pharmacy in the Hotel Astor represents a big investment and more or less of an experiment, but there is no doubt at all that Mr. James will make of it one of his customary successes.

THREE FAIR VICE-PRESIDENTS.

A neat tribute to the interest and efficiency of the women members of the Vermont State Pharma-

MISS AGNES J. QUINLAN.

ceutical Association was paid at the last annual meeting when three of their number were elected

first, second, and third vice-presidents of the association. These three interesting officials are Miss Agnes J. Quinlan of Bennington, Mrs. A. L. Cheney

MISS ELIZABETH GREGG.

MRS. A. L. CHENEY.

of Morrisville, and Miss Elizabeth Gregg of Bennington. We have much pleasure in showing the portraits of all three, and we would gently suggest at the same time that Vermont rather has the best of any other State pharmaceutical association in the country.

ANOTHER DRUGGIST IN POLITICS.

We have had a good deal to say during the past few months about druggists in public office, and we have been very gratified to know how many representatives of the drug trade have been elected to positions of importance in the community. In

CHAS. D. JOHNSON.

the December BULLETIN we printed a portrait of Chas. D. Johnson, among many other pharmacists whose candidacies proved successful in the Novem-

ber election. We are showing Mr. Johnson's likeness again for the purpose of giving our readers a few interesting details regarding his political experiences.

Mr. Johnson was born in Blue Earth county, Minnesota, in 1859, and was educated in the public schools of Mankato in that State. In 1877 he went to Brainerd, and during the thirty-three years which have since elapsed he has been engaged in the drug business in that town. Now for Mr. Johnson's political experience: He served as postmaster four years, was a member of the State Council seven years, and during four years of the latter period was president of the Council. After these evidences of public trust and support Mr. Johnson became a candidate last fall for the State Senate and was elected. As a representative of the drug trade of Minnesota at the State Capitol he will undoubtedly be able to protect and advance its interests.

SUCCESSFUL IN POLITICS AND PHARMACY.

That politics and pharmacy make a homogeneous mixture has been proved by the subject of this sketch—Thomas W. White of Newton Upper Falls,

THOMAS W. WHITE.

Mass. And yet Mr. White is only 35 years old. He is a graduate of the Newton high school and of the Massachusetts College of Pharmacy. He entered the drug business at the age of 15 and became a proprietor at the age of 21. At the age of 28 he was made a member of the Newton Board of Aldermen, and he served in that body for five years. At the end of this period, in 1909, he was

elected a member of the State House of Representatives, and was reelected in 1910.

To give a list of the clubs and organizations to which Mr. White belongs is a rather formidable task, but we might as well begin. Here are some of them: The Massachusetts State Pharmaceutical Association, The Newton Club, the Newton Players' Club, the Middlesex Club, the Massachusetts Club, the Boston City Club, and the Oddfellows Encampment. He is a Mason, a Knight Templar, a Mystic Shriner, and several other things. Evidently Mr. White is a good fellow as well as a good druggist and a good politician. He is said to be a fluent and forceful speaker, and his capacity for wit and repartee has put him in demand as an after-dinner orator.

Yes, Mr. White is a Republican.

THE NEW STATE ANALYST IN MICHIGAN.

There have recently been some changes in the Dairy and Food Department of the State of Michigan. Commissioner Dame, himself a new

FERN L. SHANNON.

appointee of Governor Osborn, has selected Fern L. Shannon as State Analyst to have charge of the dairy and food laboratory. Mr. Shannon's training seems to have fitted him admirably for this important position. Graduating first from the high

school in Camden, Michigan, he spent one year at Hillsdale College, and then took the four-year course in pharmacy at the University of Michigan. He was graduated two years ago with the degree of B.S., and since that time has been instructor in drug and food analysis at the University. So successful was his work, and so level-headed was the young man generally, that Dr. Schlotterbeck and Dr. Stevens warmly indorsed him for State Analyst when asked to recommend an efficient candidate. We understand that Mr. Shannon is anxious to have it known that in his relations to the retail druggists of Michigan he will follow out the policy established by his predecessor, Floyd I. Robison—a policy of education and assistance rather than persecution and annoyance.

BARNUM AND BAILEY OUTDONE.

Ladies and gentlemen, we now ask that you turn the next page of this journal and permit us the pleasure of presenting to you the greatest collection of highbrows the country affords. We refer to our competitors and friends—the other pharmaceutical editors. These men represent the gray matter of pharmacy—the concentrated extract of the Cerebellum Pharmaceuticum. They may not look it, but it is only a simple fact, ladies and gentlemen, that they hold the destiny of the calling in their hands. Legislative committees in pharmacy may think they secure the passage of laws. Teachers may beguile themselves pleasantly with the assumption that they plant the seeds of education in which lies the best hope of the future. Association leaders may lay to their souls the flattering unction that they are forming pharmaceutical opinion and achieving pharmaceutical reforms. But, ladies and gentlemen, these are delusions all. The men we show on the next two pages of this journal are the real powers behind the throne—the real educators—the real leaders—the real molders of opinion—the real goods in every particular.

Step right this way, ladies and gentlemen. The big show is on. Positively the only appearance in public—the one and only performance. Walk right in. Admission is free. We make no charge for the greatest intellectual exhibition of the century—nay, more, the most marvelous variety of intelligence the world has ever witnessed.

Druggists Photographed in Their Stores.

2. Dr. Clement B. Lowe, Philadelphia, Pa.

Prof. James M. Good, St. Louis, Mo.

One of the sanest, soundest, most patriotic pharmacists and best-loved teachers in the United States.

New York's Latest Contribution to Drug-store Art.

Frederick K. James's new pharmacy in the Hotel Astor is for the exclusive use of the guests of that fine hotel, and it has no street entrance whatever. The fixtures of "piano" mahogany, done in Bangs's best style, and the whole decorative scheme generally, put the place in harmony with the artistic environment of the Astor and with the famous Orangerie just across the corridor. The show-cases are all of the buffet wall style, there being no counters at all, and the display of expensive sundries and toilet articles is dazzling in the extreme. Something about Mr. James himself, of whose group of stores this is the fourth, is printed elsewhere in the "Hall of Fame" department.

HOW THEY USE THEIR WINDOWS.

Several Druggists Describe Their Methods—The Importance of Regularity in Changing the Exhibits—What Articles Make Attractive Displays—Linking Trims to Newspaper Advertising—Specific Instances of Large Sales Accomplished Through the Window.

To dwell on the value of window displays in a vague and general way is not the purpose of this symposium. Several druggists discuss the subject from their own practical view-points. Some of them cite specific instances of goods sold through this form of advertising—goods that otherwise would have remained on the shelf. Ours is a busy world and these are busy days, but every now and then some fellow hits upon a scheme that really stops the passing crowd and bids the people: "Come in." In the following contributions will be found several plans of just such drawing force. Read them.—THE EDITORS.

CHARLES W. HOLZHAUER, NEWARK, N. J.

We usually change the trim in our windows weekly, except when conditions warrant a longer period, and we always make the change on the same day if possible, having the window cleaned out on the night before and ready for the new material the

CHAS. W. HOLZHAUER.

next morning. Candy displays we never continue longer than a week, because if people constantly see the same goods in the window for a long period they will get the idea that our stock is not fresh. If a brush or sundry trim is doing well we frequently let it run several weeks, and exceptionally good and novel displays we have continued for three weeks straight.

We display in our windows only such goods as yield an adequate return, our own specialties, sundries, and occasionally a purely drug display or a fountain window. If an outside concern wishes us to make a display of their goods, and the article is a legitimate one, we will frequently make an arrangement with them, they giving us a cash consideration, or an equivalent in goods, which will at least equal the profit we would get from a similar display of our own preparations.

We often use newspaper space, calling attention to our windows, and find that it pays.

UNITY NECESSARY.

The first essential of a good window trim is *only one article at a time*. We never make a display of a dozen articles at once. The passer-by, on glancing at such a display, carries away nothing with him, but if there is only one article, and that is prominently shown, he can't possibly help but see it; and though he is not in a buying mood at the time, when he does require that article he will remember having seen it in our window. This we have seen demonstrated time and time again. People call for goods that we displayed months before. By showing only one article at a time, the impression is also created that a large business is being done in that article, particularly if you have a liberal quantity of the thing displayed.

THE WINDOW'S SELLING VALUE.

We find that window displays pay handsomely, and careful attention should be given to them, because aside from the goods that they sell, windows reflect more than anything else the character of the store. I could overload you with exact figures of

the quantity of goods we have disposed of through our windows, but one or two instances will suffice.

Every spring we make a display of sulphur and cream of tartar tablets. This will be the fourth year we have used exactly the same display. Here are the figures for 1909 and 1910:

Sold during two weeks display April, 1909, 778 10-cent boxes and 89 25-cent boxes.

Sold during two weeks display April, 1910, 1080 10-cent boxes and 168 25-cent boxes.

These figures do not include goods sold after the display was taken out of the window. The demand kept up along into the hot summer months.

GEO. A. SKELLY, MINERAL POINT, WIS.

The professional window dresser advises a change of trim about every seven days. With the average pharmacy it may not always be convenient to make the shift quite so often, although I would advise adhering as nearly as possible to this time. Of course, occasionally one is justified in extending the time of display to two weeks in case of an exceptionally fine show, but this I would consider the extreme limit. It is well to be systematic with the work. Have a regular time for the changes and follow it as closely as possible. Different stores will vary as to the most convenient days in which to conduct this branch of the store's routine, and that matter can best be adjusted by the person in charge to fit each particular case.

VARIETY MUST BE OBSERVED.

Vary the displays. Don't fall into the rut of everlastingly showing the same articles. Every pharmacy carries a sufficient line of merchandise to make an indefinite amount of trims. Be seasonable. It scarcely seems necessary to enumerate items for window displays, but for the guidance of the beginner the following suggest themselves: Paints, brushes, stationery, wall-paper, rubber goods, books, toilet articles, perfumes, fountain pens, shaving supplies, chemicals, crude drugs, etc. This merchandise is mentioned as an example, it being understood that all pharmacies do not carry all the foregoing lines. Devote a little study to this particular branch and you will soon develop the faculty of not being at a loss as to what the window will be used for next. Plan your work ahead a short time.

A most excellent opportunity is presented to the pharmacist to connect directly his newspaper display

ads. or announcements to his show window. Call the public's attention to the fact that you have a certain article on exhibit, especially if you have something good at a special figure. Feature new goods often in this manner, and thereby create in the minds of the public the impression that you are running an up-to-date store, and are continually stocking the new and late novelties.

SOME ESSENTIALS.

The essentials of a good window trim are: Avoid giving an overdrawn or crowded appearance. Don't try to display half a dozen lines at a time. Confine yourselves strictly to one. Place a sufficient amount of goods on show to make an attractive trim—that is, make it showy and yet not overdone. If the articles shown are small, arrange them in a neat and catchy shape, in squares, diamonds, etc. Line them up with a straight edge, so that they are true and symmetrical. Attention to these small details will attract the eye of the passer, and especially of women, who are admirers of neatness. Use care in selecting contrasting colors. The merchandise displayed should be in good relief, yet not in extreme contrast. Oftentimes the introduction of two or three neatly cut-out and mounted pictures will add materially to the general effect.

No mention as to finish or style of work has been made in this article, no word as to dressing the platform or the background. This is a feature that would involve the use of considerable space and time. To the amateur I would suggest the purchase of a copy of "Window Displays for Drug-gists," which will give very many valuable suggestions bearing on this subject, and is a book not to be overlooked by the professional as well.

PRICE MARKS IMPORTANT.

And now for what is considered of the utmost value in window work—the price mark. Never make a display, no matter how large or how small, that you do not plainly mark the price of the article on sale. Unless one observes this point, the trim loses a large percentage of its effect.

From a close connection with window trimming for some years past, I can say without any hesitation that the pharmacist who is overlooking or neglecting this work is sacrificing the most valuable space of his store, and letting go by default a most excellent chance of increasing his bank account. 'Tis true every pharmacy cannot support a professional trimmer; nor is that to be expected. The

average store will have some one connected with it who can devote a little time now and then to this important branch of modern pharmacy. If you have not already given this matter special attention commence in a small way; work on simple displays at first. Study shape, colors, spacing, etc., and you will be agreeably surprised at your progress.

For the benefit of the clerk of to-day let me add the following suggestion: Devote some of your spare moments to this work. You will increase your value to your employer, and if you become moderately proficient in it, it will materially improve your condition as an all-around man.

SOME DIRECT RESULTS.

In conclusion, let me call your attention to some of the *direct* results of window trimming. Some time since we bought a very liberal supply of initial stationery. This we placed on sale by making a good, showy trim. The selling price was plainly marked in two or three places. It seemed to have an almost instant effect. The ladies were much interested in the paper and a liberal sale followed.

It is surprising, too, the number of bags of horehound drops we sold after dumping a barrel of the goods in the window. The people apparently could not resist the temptation. A number of instances could be cited to show the direct selling power of the show window.

Brother pharmacists, make your trims work for you, and gain the extra revenue that you are entitled to.

H. M. CURRY, ELLSWORTH, KANS.

We change our window trim every Friday for this reason: Our newspapers being weekly issues only, are published on Thursday, reaching the majority of readers on Friday; to have clean, fresh window displays that as a rule connect with our advertisements is to put our best foot forward just at the time when the thought engendered through the advertising is fresh in their minds.

DISPLAYS TO CONFORM WITH OTHER ADVERTISING.

Having probably read the papers, if on visiting town the following day or two, people see the goods displayed, with show cards and prices that recall the ad., there is likely to be a pretty well determined desire to buy; and if the goods are right, the advertisement and price true and alluring, there usually result sales sufficiently satisfactory to make it pay.

We have had many instances where a good window display simultaneously advertised has brought immediate results, and many others wherein the results continued to augment trade in some meritorious article. We have in mind a demand for a special brand of stationery that has steadily grown for more than three years.

Our Hazel Cream is another article that grows in popularity after good displays, and is as staple as Castoria, and almost as old-fashioned; but it's honest, does the work, and holds its own alongside all the newer "fads."

THE ESSENTIALS.

We consider the essentials to good window display to be cleanliness, timeliness, unity, and well-executed show cards and price tickets. Simple color harmonies and careful attention to guard

H. M. CURRY.

against an overcrowded appearance are to be observed. As a rule, it is the article you are showing that does the work. It must impress upon the passer-by its character, its merits, and its price. The quantity of goods on display is occasionally an important matter. It impresses one with the popularity of the article, proving the advisability of large purchases on the part of the merchant who displays it, and probably leads prospective customers to think that if it's such a good thing, 'twould be well to join the chorus and go marching along.

Clean displays, often and systematically changed, grow to impress many persons who habitually pass

your windows, and they learn to look for them. Once you get people to doing this, and you have attained the superlative in window display. Your windows are working for you, and as they are maintained in their excellence, just proportionately are they a valuable asset in the business.

Don't be satisfied with good enough, keep trying to do better, and the results will surely be gratifying not only to the window dresser but to the "boss" as well, and he's the man who raises salaries.

P. HENRY UTECH, PH.G., MEADVILLE, PA.

We always aim to get up original trims, and if they happen to be something unique or unusually attractive, we let them remain from 10 to 14 days. Otherwise we change them oftener and in summer time always every week. By concentrating our efforts on one item, *i.e.*, by connecting our newspaper ads. with the window display, we have at times gotten extraordinary results. I have in mind a tooth-brush display made some months ago. We took some little pains to get up a sort of spider-web arrangement which, aside from fascinating passers-by, sold about four dozen 25-cent brushes during the first week. Nor was this all, for time and again customers when purchasing brushes at a later date would incidentally remark that they had seen such a unique tooth-brush window here several weeks ago.

PUSH YOUR OWN SPECIALTIES.

As I have repeatedly told BULLETIN readers before, it pays to feature preparations of your own manufacture. Get up preparations of merit. Get them up neatly and display them frequently and in season. Get up catchy show-cards and window strips. If it happens to be a toilet cream or a hand lotion, put out liberal quantities of samples. These cost but little and bring surprising returns.

We feature many different preparations, and on one in particular, a hair tonic, our profits exceed more than \$100 a year. I call attention to this item in particular, because it is one which the average druggist seldom undertakes to market, preferring to sell the ordinary patent nostrums at a meager profit.

NO PATENTS FOR US.

We never display patent medicines, nor do we make use of any of the made-to-order window trims of the patent-medicine concerns. There is a two-fold reason for this. In the first place, we claim to

have brains enough to create an original design or two of our own products which pay a much handsomer profit and give much more satisfactory results to our patrons. And secondly, we aim to run a first-class pharmacy, and not simply be purveyors of patent medicines, which latter cannot fail to antagonize the good-will of reputable physicians whose business we much prefer.

SPECIAL FEATURE WINDOWS.

To get the best results, we display only one item at a time in the window, arranging the trim artistically, and making liberal use of catch-cards and window strips. We fill the entire window, often

P. HENRY UTECH.

using several gross of an article if necessary to make the display effective.

Another most excellent scheme is to get up special trims, such as a house-cleaning window, in spring-time; a hot-water bottle trim, in zero weather; etc., etc. We generally get up a "sick-room" window, using such articles as bed-pans, fountain syringes, invalid rings, hot-water bottles, ice-caps, etc. We arrange a window of this kind three or four times a year and always secure excellent results from it, beside eliciting numerous inquiries from curious persons who happen to pass by.

By carrying out the suggestions herein noted I am positive every druggist will get pecuniary results. Furthermore, it is always well to remember that in the eyes of the general public a store is judged largely by the appearance of its show windows.

G. W. PFENDER, CHICAGO.

A window should be trimmed at least once every week, although there are exceptions where a trim may be left to advantage for another week, but never longer than that.

THE DAY TO TRIM.

A great deal depends on the location of the store and the nature of the goods displayed. A good time for trimming the window is on Friday; then you have a good clean display for the Sunday sight-seers and for those who do not take the time to look during the week. But the best time of the week to trim is on the day one has the most time to devote to the work, as a hastily and poorly arranged window is little better than none.

We usually display everything except patents.

G. W. PFENDER.

During the proper seasons we have our own preparations in the way of cod-liver oil and emulsions, cough mixtures, beef, iron and wine, talcum, etc. Between times we use the window for rubber goods, sponges, soaps, perfumery, stationery, etc. Once in a while a cigar display is very profitable.

TYING UP DISPLAYS WITH AD. MATTER.

Connecting a window display with a newspaper ad. is probably a very good plan in a small town where the distances are not too great for patronage and where customers have a chance of becoming more personally acquainted with the store without going too far out of their way. Distributing circulars from house to house is a better plan in the city. We have tried that with our sundry line and have had splendid sales.

The most essential parts of a good display are neatness in placing the goods. They should not be too crowded and never too many articles of a different nature. It is always better to have a few articles nicely arranged with a good background than so many that none impress themselves on the mind of the observer.

AS TO PRICE TAGS.

It is doubtful whether everything should be price-tagged or not. If there is a special inducement, then it is well to mark the goods, but if the display is of an article which may be considered more a luxury than a necessity, then the curiosity of knowing the price often brings the people into the store, and a sale can be made. If on the other hand the price were on the article and was considered too high for the observer, he would simply pass on.

Window displays do certainly pay; and the more attractive, the better the sales. We positively know that our sales on such things as tooth-brushes, combs, hair-brushes, manicuring goods, and other small articles are nearly always doubled when on display—in fact, it is so with everything, and the druggist who neglects his window is certainly making an unpardonable mistake. It is without a doubt the best and cheapest advertising any druggist can do, regardless of the dollars it takes to buy the necessary trimmings and often the time some think is wasted at it. Besides, it is certainly more satisfying to a druggist to hear people comment favorably on his windows than to hear the remark: "That fellow never has anything in his windows but a lot of patent-medicine dummies, smoking tobacco cartoons, and other junk."

HARRY S. SPONGBERG, ROCKFORD, ILL.

In our store we change the trim in the window once a week, usually on Thursday. In making our displays we try to show such goods as are liable to bring best results and the most profit. Among the practical lines displayed are drugs, drug sundries, toilet goods and preparations, soaps, paints, brushes, trusses, surgical supplies, and rubber goods. As a rule we give very little space for patent-medicine displays. Occasionally we have in our trims articles mentioned at the same time in our newspaper announcements.

The essential characteristics of a good display are clean goods, neat arrangement, good, plain show cards and price cards. I find that window displays

are one of the best advertising media possible. Certainly they are very profitable. An instance of this I noted recently. We made a soap display, and as a specialty introduced a new brand of glycerin soap which sold for five cents a box. As a result of our efforts we sold over two gross in one week, disposing also of several boxes of other soaps.

A. ARMOR, PITTSBURG, PA.

The window is the soul of your store. Improve your opportunities in that direction if you wish to make additional sales.

My windows are trimmed once a week, on Friday. The two remaining days of the week are practically holidays in our city, and for that reason the public have an opportunity to see what there is to offer and can be promptly cared for. Windows must be clean and well lighted.

I alternate my window displays, giving publicity to my own preparations first, then bring in side-lines such as stationery, cigars, confectionery, and other specialties that give me a fair margin of profit. All goods are price-marked. The idea acts as a silent salesman.

I do not advertise any cut-rate goods. I have never used any newspaper advertising, but display advertised goods; I think this a good idea. I have distributed handbills with telling effect.

In trimming my windows I make an effort to be as original as the circumstances will permit. Signs and cut-outs are arranged to give an artistic tone to the surroundings. Study to make your window attraction bring customers into your store.

My windows have sold many dollars worth of goods. A record is kept of each display and results have proved very satisfactory. Goods in their season bring the best returns.

W. E. NEBLETT, RIVERSIDE, CAL.

We make it a point to change our window trim once a week, Wednesday being the customary time. As to the class of goods to be displayed, we do not confine ourselves to any particular kind. We show all sorts of lines, but at different seasons. We never display more than one thing at a time.

We have never tried to pattern our windows after our newspaper advertisements, or *vice versa*. Both are separate and distinct, the object in the window being in no way determined by what we may happen to be pushing in the newspaper.

In my opinion the essential characteristic of a good window trim is just this: Show one thing at a time and do it in a catchy, new way. Once attract the eye of the passer-by and you have won.

Do window displays pay? To be sure. I can cite many specific examples by way of proof. Last week we exhibited a line of tablets, marked 10 cents a package. It hadn't sold before, but by making a window display we disposed of several dozen.

All told my windows pay me better than any other advertising. I can sell anything I show.

CARL C. KENNEDY, GROVE CITY, PA.

I change my window trim every week with few exceptions, and as a rule do this about the middle of the week. I select for display any goods on which I can make a reasonable profit.

The results are usually very good. I try to

CARL C. KENNEDY.

correlate the window with my newspaper advertising, often making Rexall articles the subject of both.

The essential things in a window display, in my estimation, are neatness of arrangement, not too much goods displayed, and any kind of a sign "to make people stop."

The selling value of window displays must be evident to any one who has tried them. Not long ago we had a rubber goods trim, and it practically cleaned us out of the stock.

THE PRESIDENT OF THE A. PH. A.

John G. Godding, of Boston—The Man Himself and His Business—Something, too, About the Fashionable District in which His Stores are Located.

John G. Godding, of Boston, was recently elected president of the American Pharmaceutical Association by the present system of choosing the officers by mail. Three nominations for each office are made at the annual meeting, and the voting is then done by the assistance of Uncle Sam. This throws the franchise open to the entire membership of the organization instead of restricting it to the relatively small number who are able to be present at the conventions. Mr. Godding was one of the three nominees for president, and when the votes had been

Mr. Godding.

counted it was found that he had run away with the honor. Incidentally it was quite appropriate to elect a Boston man to the position in view of the fact that the 1911 meeting will be held in that city, and Mr. Godding can therefore be installed in office in his own town. Of course he will preside, not at this convention, but at the meeting in 1912—wherever that may happen to be held.

Mr. Godding is one of the men who are long on judgment but short on talk. He doesn't say very much, but people have a habit of going to him when they want the assistance that can be rendered by good sense and unflinching integrity. It is for this

reason that Mr. Godding has so long been treasurer of the Massachusetts College of Pharmacy, and it is not without interest to say that in this capacity he

Mrs. Godding.

shares the responsibility with others of handling what is by all odds the largest endowment of any

The Godding home in Boston.

school or college of pharmacy in the United States. The Warren B. Potter fund, left to the college some years ago, amounts nearly to \$200,000,—and there

Exterior of the main Godding store at the corner of Dartmouth and Newbury Streets in Boston. This pharmacy is located right in the heart of the Back Bay District and is only a block distant from the famous Copley Square.

are two or three other funds considerably smaller in size. It might be added in this connection that Mr. Godding has been a member of the Board of Trustees of the Massachusetts College for many years, and that he was treasurer of the Boston Association of Retail Druggists until he positively refused reelection two or three years ago.

The character of Mr. Godding's business in Boston is well reflected in the character of the man himself. It is of the solid and stable order. There are two stores—one at the corner of Dartmouth

and Newbury Streets, and the other at the corner of Massachusetts Avenue and Beacon Street. The first of these was the original Godding store, and Mr. Godding has been in business on that corner for upwards of 28 years. The location is right in the very heart and center of the fashionable "Back Bay district." Copley Square is only a block distant in one direction, and Commonwealth Avenue but a block in the other. Commonwealth Avenue, be it understood, is the pride of Boston, and here are to be found the wealthiest and the elite people in the city. Copley Square, on the other hand, is occupied by the Public Library, Trinity Church, and the Art

This shows the exterior of the store formerly owned by William D. Wheeler at the corner of Beacon Street and Massachusetts Avenue, only a block distant from the Charles River where during the season the Harvard crews may be seen in training. The store was purchased by Mr. Godding three or four years ago.

Interior view of the main pharmacy, showing the store to be dignified and rich in effect, harmonizing well with the district and the character of the trade enjoyed.

Museum—the first two of these being among the most famous buildings in the country.

This store is preëminently a family pharmacy, and some of the "best people" in Boston are numbered among the patrons of the establishment. Nearly 160,000 original prescriptions—not counting "repeats"—have been dispensed in this store, and a considerable mail-order trade has been developed. The pharmacy itself, as will be gathered from one of our illustrations, is rich and dignified in effect, thus harmonizing well with the district and the character of the trade enjoyed. Mrs. Godding is of considerable assistance to her husband in the management of the store, and in particular concerns herself with the Godding line of specialties. She has charge of the advertising literature and looks after its distribution. The 1500 book accounts of

the establishment are also under her supervision. Twenty people, it may be remarked incidentally, are now required to transact the Godding business.

Mrs. Godding herself is well known as one of the small band of Boston women who caused the formation six or seven years ago of the Women's Organization of the N. A. R. D. She was secretary of the society for several years. The Boston Chapter

was the first to be created; she was elected president of it; and if we mistake not she still holds this position. At any rate, she headed the Chapter for several years. Mrs. Godding is well known personally among the membership of the N. A. R. D. and the A. Ph. A., and she and Mr. Godding are regular attendants upon the conventions of the two organizations.

USEFUL HINTS FOR THE PRESCRIPTIONIST.

Suggestions that Conduce to Elegant Dispensing—Methods of Disguising the Odor and Taste of Some Familiar Preparations—Other Observations of Value.

By JOSEPH HART,
Portland, Oregon.

Since you saw fit to publish one of my letters in your journal on Dispensing Hints (page 473, Nov., 1909), I again take this means to promulgate what I think will be of interest, and hope it may encourage others to do likewise.

Balsam of Peru blends so nicely with iodoform in ointments as to almost cover the odor of the latter.

The addition of three ounces of water to the pint of tincture of benzoin, and then filtering, will be appreciated by the ladies who buy this article for toilet purposes as this addition prevents the familiar, disagreeable gumming when the tincture is added to water.

Alcohol is very easily dehydrated by adding a little gelatin and macerating several days.

Oil of bitter almonds very effectually disguises the odor of cacao butter, thereby enhancing its value for toilet uses.

The brushing of chocolates with a soft brush give them a markedly fresh appearance.

I make fresh argyrol solutions quickly by keeping my argyrol finely ground in an amber wide-mouth bottle. When the solutions are ordered I add the required amount to the bottle containing the water, carefully pouring the argyrol so that it will not adhere to the neck of the bottle, afterward shaking the container several times, then laying it on its side. The salt will be in solution before the customer calls or desires to use it.

Sprinkle protargol on the water in the dispensing bottle and let it stand until dissolved, thereby avoid-

ing a slightly turbid solution which results when glycerin is used and obviating filtering. This holds good for weak solutions, not exceeding 5 per cent in strength.

In dispensing ointments in collapsible tubes, such as Adrenalin, Baume Analgesique, etc., you can make a very neat and easy-to-wrap package by peeling off the label from both the tube and the lid of the box, pasting a white strip of paper over the latter, and putting the prescription label with directions onto this.

By dipping weights in a concentrated aqueous solution of potassium cyanide and then washing off in clean water one obtains bright, clean weights with practically no loss of mass. The same holds true with dirty coins. It is an advertisement to hand to a lady who wears clean white gloves, nice new or clean coin for change.

To seal soluble elastic capsules, take a small piece of wire, make a loop at one end to fit over the cut end of the capsule and apply the sealing gelatin by means of the loop.

It was suggested to use soap liniment in the molds in making suppositories by fusion in the old-style molds for the purpose of keeping the suppositories from sticking. I find after using the liniment the addition of lycopodium to the molds is of a decided advantage. When the suppositories are finished, do not throw this lycopodium away as waste, but keep it for rounding pills. When the pills are finished, notice what a pretty, odorless gloss they have.

Balsam of tolu with heavy calcined magnesia is far superior for massing pills or capsules that contain such ingredients as creosote, oil of savin, etc., than pepsin which has been suggested.

The patient will appreciate the dispensing of granulated boric acid in the place of the powdered when the directions call for a definite quantity to be dissolved in a given amount of water; for the granulated does not float and is more easily soluble.

To avoid duplicating stock especially in the prescription room and when things are ordered in quantities, attach a strip label at the bottom of the original label to the effect that more is in the basement or storeroom.

The following prescription has caused some trouble for the boys with whom I have worked:

Aristol	10 grains.
Menthol	5 grains.
Eucalyptol	6 drops.
Camphor	4 grains.
Carbolated white vaselin, 1 per cent.	1 ounce.

Mix and make an ointment and put it into a tube with a long tip. Rub the aristol with a little petroleum oil, such as albolene, etc., on one end of the slab, and on the other menthol, camphor, eucalyptol, and the required amount of carbolated vaselin; then incorporate the aristol mixture gradually in the menthol-camphor solution, and you will get a perfect solution which will mix readily with the vaselin without lumping. Roll this ointment in a piece of paper so that it will fit the tube and insert the roll, leaving a little paper over the end of the tube. Press the ends firmly against the paper so that in rapidly pulling the paper out, the tube retains all the ointment. In this way one need not even soil his hands. Finally seal the tube by making two end folds.

TO PREVENT DETERIORATION IN DRUGS.

Valuable Hints Regarding the Preservation of Crude Drugs, Syrups, and Tincture of Iodine—From a Bulletin Published by the Kentucky Agricultural Experiment Station.

Most crude drugs when received by the druggist in a modern drug store are very seldom in the form in which they are packed or collected. They have passed through the hands of the drug miller and reach the druggist usually in powdered form, ready for percolation or maceration, or other form in which the drug is to be used. But there are several crude drugs handled by the druggist, which have not been ground, such as spices, rhubarb, cardamom, compressed herbs, etc.

Many crude drugs when gathered contain a large amount of moisture, varying anywhere from 5 to 80 per cent of the weight. In order to preserve them and to facilitate comminution, they must be dried, and, owing to their porous nature, are very prone to reabsorb moisture and become moldy.

HOW TO KEEP CRUDE DRUGS.

The practice of keeping crude vegetable drugs in cardboard or paper containers, or in open drawers, in drug stores, is not good practice, as a great many of them depend for their medicinal properties upon the presence of volatile principles, and when so kept, rapidly lose a considerable portion of such constituents in the hot dry atmosphere of the average drug store. Ofttimes such drugs, when kept in this

manner, are stored near a stove or radiator during the winter months, and subjected to its direct heat.

Such drugs should be placed, as soon as received, in japanned tin boxes provided with removable labels. Let them be so arranged that odorless drugs will not be kept in close proximity to those possessing strongly odoriferous principles, thus preventing contamination.

The boxes containing such drugs should be kept in a cool, dry place in the storeroom, and only a sufficient quantity taken from them and kept in the store to supply the immediate trade.

ATTACKS FROM INSECTS.

Some crude drugs are especially liable to attack from insects, and the insect that is apt to attack a particular drug will depend to a large extent on the nature of that drug, and the physical characteristics of the insect.

The insects most injurious to crude drugs are those provided with strong jaws for biting. In this class may be cited the mites, many kinds of beetles, and some insects that are injurious in the larva stage.

The mites are small, round, oval insects with eight legs, and the mouth is provided with a beak. There

are many species of the mite: some being known as sugar mites, cheese mites, etc.

Cantharides are often attacked by a mite belonging to the genera *Glyciphagus*. The presence of this pest may be known by the formation of a considerable amount of dust and broken fragments collecting at the bottom of the jar; and by careful examination small whitish objects may be seen moving about in the powder.

Prof. L. E. Sayre, of the University of Kansas, reports having found a small beetle, *Satodrepa panicea*, feeding on columbo, aconite, mustard, althea, belladonna, pokeroor, ginseng, angelica, and other drugs.

Ergot, belladonna root, musk root, powdered senna, powdered jaborandi leaves, sweet almonds, etc., are attacked by species of the same family (*Plinidæ*).

Several other drugs are attacked by some form of insects, and large quantities are damaged to such a degree as to prevent their use in pharmaceutical preparations.

Drugs liable to be infected with such insects should be treated with the vapors of carbon bisulphide, chloroform, etc. Lay them in tight boxes and set within a wad of cotton, or a sponge, saturated with the insecticide. Then close the containers tightly and allow them to stand for about twenty-four hours, until the vapors have had time to thoroughly penetrate the contents, after which expose the drugs to air until they are free from vapors.

Sunlight is also valuable to prevent the growth and destructive action of such insects.

SYRUPS.

This is one of the most troublesome classes of preparations that the druggist is afflicted with, because many of the official syrups are seldom called for, and the druggist usually finds that the stock on hand has spoiled, by becoming sour, or mold has formed in the bottle, etc., this usually occurring just when a "hurry up" prescription is received.

Consequently the making of syrups should receive the druggist's most careful attention, for while attention to details will not always prevent the spoiling of his syrups, yet it will prevent it to a great extent.

Syrups deteriorate for several reasons:

First, impure sugar used.

Second, inversion of sugar to fermentable sugar, by (a) acids being present in solvent; (b) heating too long.

Third, excess sugar used, which subsequently crystallizes out, leaving a weak syrup.

Fourth, insufficient amount of sugar used.

Fifth, contamination with molds, yeast "germs," and other fermentative bacteria.

Sixth, loss of active ingredients by (a) volatilization by heat—*e.g.*, syrup of wild cherry, etc.; (b) oxidation—*e.g.*, FeI_2 .

Seventh, discoloration caused by caramelization of sugar by acids.

These changes may be prevented to a large extent by:

First, using pure sugar and carefully adjusting the proportion of sugar to solvent.

Second, filling small bottles completely full with the hot syrup and stoppering tightly, and keeping in a cool place.

Third, by use of preservative, as specified in Pharmacopœia, as in syrup hydriodic acid, etc.

Fourth, by the use of "cold process," which prevents the formation of fermentable sugars.

Fifth, by preparing only as much syrup as can be used up quickly.

TINCTURE OF IODINE.

There is hardly a preparation in the Pharmacopœia which varies so much as this one, which is due to two causes:

First, carelessness in preparing.

Second, carelessness in storing and keeping.

The first cause needs no comment—it speaks for itself; the second cause has certain extenuating circumstances which may relieve the druggist of a certain portion of the responsibility.

Tincture of iodine, when prepared without potassium iodide, rapidly forms ethyl iodide, and hydriodic acid, with corresponding loss of free iodine, which is entirely prevented by the use of the quantity of potassium iodide directed by the U. S. P.

If exposed, it loses alcohol faster than it does iodine, becoming rapidly stronger, sometimes reaching a concentration of 200 per cent, or more, of the U. S. P. strength.

It should be kept in tightly stoppered bottles, in a cool place, and never be dispensed with cork stoppers, as iodine rapidly attacks cork.

"MY MOST EXCITING EXPERIENCE."

A Darling Boy Swallows Iodoform—A Clerk Who Saw Prison Doors Staring Him in the Face—A Customer Is Denied the Privilege of Dying in the Store.

A PSEUDO-IODOFORM POISONING.

By G. E. MANN, SARNIA, ONTARIO.

An exciting and amusing incident occurred a few days ago. I was weighing out some iodoform which a physician had ordered sent when a lady and a little boy four or five years old walked in. I left the iodoform on the scales and proceeded to wait upon her. She wanted some perfume, and it took her some time to decide upon a satisfactory one. The boy was meanwhile making himself at home, pulling over this and that, and his mother seemed to think that it was perfectly right for her pet to enjoy himself.

All at once he gave the most terrible howl, followed by more of equal intensity. Running to him we had no difficulty in learning that sonny's trouble was only due to helping himself to the iodoform and the taste had displeased him. I do not suppose he swallowed any, but his mother was of a different mind. Wetting her finger she tried some for herself, and instantly concluded from the taste that it was poison. Without even asking what it was or giving me time to explain, she grabbed up the kicking and squalling youngster, who was doing his best to turn the air blue with his yells. Then she started down the street to the doctor's. Now a woman running along a thoroughfare with a child in her arms and moaning that her darling had been poisoned was sufficient to draw a nice, big crowd. Rumor soon had it that this was the store where it was done, and so persistent was the story that I had to publish an item in the paper giving the truth. The doctor to whom she went telephoned me, whereupon I explained the situation and thus it was all smoothed over.

A NARROW ESCAPE.

By E. M. R.

It had been an unusually busy day, and it was after twelve when I slowly climbed the stairs to my room above the store. I hurriedly undressed and almost immediately dropped off to sleep. I had not been in bed very long when I was awakened by the buzzing of the night-bell. Slipping on some

clothes I went down to the door, and there stood a small girl with a prescription. I told her to come in out of the cold night air until I filled it.

In a few minutes it was finished, and after being wrapped up, away she went with it. I locked the door after her, and then went back to the prescription department to arrange the things I had used. The first object my eye fastened on was the bottle of strychnine sulphate instead of an almost harmless alkaloid which the prescription called for. I realized instantly what I had done and what the outcome would be. As soon as I could catch my breath I grabbed my hat and out I rushed in search of the girl with the prescription.

Up and down the street I ran, but neither I nor the few people I met saw anything of the girl. Disheartened, I went back to the store to wait—for what? How long I sat there virtually waiting for the authorities to come and get me, I do not know.

A knock at the door and up I jumped to let in—whom? There stood the small girl with the contents of the prescription dripping from the paper wrapper. She had let it drop and was crying for fear her mother would whip her for being careless. Thoroughly awakened I put up the prescription a second time and sent her on her way smiling and her pockets bulging with gum drops.

"All's well that ends well," of course, but when I think how different it might have turned out—whoop—'nuff said!

A SUICIDE FRUSTRATED.

By W. WHYTE, ROODEPOORT, TRANSVAAL, SOUTH AFRICA.

I will give you an exciting incident which happened to me in Glasgow some 25 years ago. One evening at dusk I was alone in the shop when a gentleman customer known to me strolled in and asked for laudanum. I supplied an ounce and a half after he had informed me it was intended for sprinkling on a poultice. Our till was rather low. On looking up after getting the change I was amazed to see the man taking the empty bottle away from his lips.

"What have you done?" I shouted. "You might have played the game and gone elsewhere instead of getting me into trouble." Thereupon he started talking, and then for the first time I noticed he had been drinking.

"Give me a dose of arsenic," he went on, "so that I may be sure of dying quickly."

"Righto," said I, "you may as well do it properly." With that I mixed an ounce of mustard with a tumbler of water. On being assured that this mixture was all arsenic and guaranteed to kill in five minutes he gulped the lot.

As soon as that was done I left the shop to look after itself and ran for a doctor. Unluckily it was not the usual hour to find one, and after trying in vain, I returned. The back room was in a nice mess. The mustard had worked all right. Then a doctor came in, and we bundled the patient off home, which was close by, where his two brothers walked him around under the doctor's supervision until he quite recovered. Of course the boss spoke about the matter after I had told him everything, but the man was well connected and the matter was dropped.

A PRETTY EUTHYMOL WINDOW.

A rather attractive display of Euthymol Girl posters was made not long ago by John Von Rohr, of Winona, Minn. There were eight of them

were used in the novel manner shown by the engraving. On the floor were a half-gross or more of the tooth paste itself. Some of this stock was

across the top of the trim, and one in the lower center made into a panel effect through the effective use of dummies. Several other Euthymol dummies

displayed in dozen-packages, while on each side of the window was seen a pile of the loose tubes. The trim attracted a good deal of attention.

DRUG-STORE SKETCHES.

THE DEMON UNLEASHED.

By ARTHUR L. BUZZELL.

"You see, you see, gentlemens, I hold here in my hand a flask; a common flask, you see, gentlemens. In it is a light amber liquid. Taste it. It is harmless."

K. Salverson, fat, flabby, fawn-eyed, stretched forth an unsteady right arm and received a shake of the head from each of us.

"You are unkind, gentlemens. You would tell me that I do not know what I am doing. I shall demonstrate on myself." And the old man took a drink from the flask.

"You see, you see, misters, it does me no harm. It is inert; like so much water. It is indeed a wonderful discovery. Now, gentlemens, I will take some of this liquid; I will take, to be definite, two and three-fourths ounces of this liquid, and I will turn it into this gallon bottle of pure rye whisky. I will shake, so, gentlemens. Now drink your heads off!"

"You first, my dear Alphonse," expostulated the postmaster.

K. Salverson shrugged his shoulders and, with a hurt air, poured into a graduate an even half-pint and quaffed the draught at a dozen big gulps.

"Now?" inquired the eager apothecary.

"Not yet," responded El Meritus, the cigar manufacturer. "We'll await with interest the verdict of the coroner's jury."

K. Salverson held out his two hands, palms upward, and spread his fingers. The muscles about his nose twitched nervously. "All right," he said, sadly.

For awhile there was silence. A Connecticut Swiss cuckoo, somewhere between the back room we were in and the bolted front door of the pharmacy, called out the hour of ten. All around was disorder, for K. Salverson lived here. A sagging, gaping curtain failed to hide wholly an ill-kept bed in one corner. Near the middle of the room stood a large sheet-iron stove which performed, on occasion, the double office of range and heater. A stock of scientific books, intermingled with racy French novels, leaned heavily against an unused basement door. Extending along the back wall was a long rough table whereon was grouped an impressive

array of bottles, graduates, funnels, test-tubes, and retorts. From the ceiling hung a smoking Rochester.

We waited developments. K. Salverson picked up a daily paper and began to read. We chatted among ourselves. At the end of five minutes K. Salverson turned to us again.

"You see, you see, gentlemens, I am not drunk," he ventured.

Dr. Hoyt stepped forward. "Let me take your pulse and temperature and then you do that over again," he said.

"It will please me to have you take the trouble," responded the always-weary old man, submitting patiently.

The test, and another, and another, proved futile. No exhilarating effects whatever could be detected.

"You see, you see, gentlemens, it will not make drunk," he said finally. "To rob liquor of its power to intoxicate without changing its physical properties: that was the problem. I have solved it."

We all crowded around and proclaimed K. Salverson a great benefactor.

"You make too much fuss, gentlemens," he remonstrated with evident gratitude. "It is no credit. I am chemist: I must work. What I find I find. I have more to show you presently. I can tie a string on a jag and let it go when I will. Some one must volunteer. But excuse me, gentlemens, if I take in your presence a lozenger. I have sore throat." Whereupon the abstracted, midnight student drew from his waistcoat pocket a little box, slid the cover, selected a round, white tablet and swallowed it. The act was natural enough, yet no word was spoken or move made until the little box had been returned to the pocket. Then we fell to discussing. K. Salverson took a seat apart and seemed to give little heed.

A storm had arisen, an unexpected event which caused some of us a trifling uneasiness, for we were without umbrellas. Through the two dingy rear windows an occasional glimpse could be caught of the angry river. A steamboat, a quarter-mile down, whistled for the landing.

Dr. Hoyt held a blazing taper to a half-burnt cigar while with separated fingers he pressed back against his lip and out of the fire zone an aggressive black mustache. The air hung heavy with an indescribable mixture of odors.

Suddenly all eyes were centered on K. Salverson. He had arisen and stood facing us, his usually pale features now sweaty, red, and radiant.

"Hip, 'Rah, Harrison!" he yelled, waving an arm awkwardly.

Ordinarily the humor of the situation would have struck home, and such an outburst would have been greeted by a chorus of laughter. But no mirth was forthcoming, save from the old man, who burst into song:

Oh, that little old red shawl,
That little old red shawl—
That little old red shawl my mother wore.
It was baggy at the knees
And its nap was full of fleas—
That little old red shawl my mother wore!

And then ensued a scene which is indelibly burnt into the memories of those present, a scene best sketched with one straight stroke. The weakly chemist passed rapidly through the advancing stages of intoxication, and in forty minutes lay still on the floor.

Dr. Hoyt let go the limp wrist and arose to his feet. "Telephone for the authorities," he commanded curtly.

We lifted all that remained of K. Salversen to a cleared place on the table. Some one went to the bed, got a pillow and placed it under his head. Some one else crossed the cooling hands on the throbbless breast. It was all we could do.

Dr. Hoyt inserted a thumb and forefinger into the left pocket of the dead man's waistcoat and drew forth a little rectangular box. On the sliding cover, in an almost illegible hand, was written "Quadruple Throat Troches." Turning the body slightly that access to the pocket on the other side of the waistcoat might be more easily attained, the doctor thrust the same thumb and forefinger into this pocket also and drew forth another little slide-cover box. We crowded close and read thereon the single word: "Releaser."

"He got the wrong box," said Dr. Hoyt, simply.

A WIZENED little man charged his wife with cruel and abusive treatment. His better half, or in this case better two-thirds, was a big, square-jawed woman with a determined eye. The judge listened to the plaintiff's recital of wrongs with interest. "Where did you meet this woman who, according to your story, has treated you so dreadfully?" his honor asked.

"Well, judge," replied the little man, making a brave attempt to glare defiantly at his wife, "I never did meet her. She just kind of overtook me."—*Argonaut*.

BOARD QUESTIONS ANSWERED.

AN ILLINOIS EXAMINATION.

MATERIA MEDICA.

(Continued from March BULLETIN.)

14. Give the official name and habitat of Ipecac.
(a) Name its active principle. (b) Explain its double medicinal action and give average doses.

Ipecacuanha. Brazil. (a) Emetine. (b) Small doses are diaphoretic and expectorant. In large doses ipecac produces nausea and vomiting. It is given in bronchitis as a sedative expectorant; in the digestive disorders of children as an emetic to empty the overloaded stomach and remove the mucus. The dose of ipecac as an expectorant is 1 grain, as an emetic 15 grains.

15. What principles are contained in wild cherry bark? How do the principles affect infusion of wild cherry?

The most important constituent of wild cherry bark is a glucoside very similar to if not identical with amygdalin, in connection with an enzyme, by the action of which in the presence of water hydrocyanic acid is freed. The infusion is properly directed to be prepared with cold water, as heat destroys the ferment and also drives off the hydrocyanic acid.

16. Name two official forms of colchicum.

Corm and seed.

17. Distinguish between iodine, iodoform, and iodoform.

Iodine is an element which takes the form of bluish-black plates having a luster and a distinctive odor. Iodoform, $C_4I_4.NH$, is tetraiodopyrrol, a grayish-brown powder without odor or taste. It is a derivative of the base pyrrol, obtained by the direct action of iodine upon the base in the presence of alcohol. Iodoform is CHI_3 , or triiodomethane, usually obtained by the action of iodine upon alcohol, in the presence of an alkali or alkali carbonate. It is a lemon-yellow powder, and has a very offensive, penetrating, persistent odor.

18. What are the official names for the following:
(a) Poke-root; (b) burdock root; (c) goulard cerate; (d) citrine ointment; (e) diphtheria antitoxin?

(a) *Phytolacca*; (b) *lappa*; (c) *ceratum plumbi*

subacetatis; (d) unguentum hydrargyri nitratis; (e) serum antidiphthericum.

19. What is menthol? (a) What is thymol?

A secondary alcohol obtained from the oil from *Mentha piperita* Linné, or other peppermint oils. Menthol crystals are colorless and smell strongly of peppermint. (a) A phenol occurring in the volatile oil of *Thymus vulgaris* Linné, and in some other volatile oils. Thymol crystals are large and colorless and have an aromatic, thyme-like odor.

20. Describe the taste of (a) sulphate of zinc; (b) chloroform; (c) strychnine; (d) dulcamara; (e) ergot.

(a) Astringent, metallic; (b) burning, sweet; (c) intensely bitter; (d) at first bitter, afterward sweetish; (e) disagreeable.

PHARMACY.

1. Give outline of the preparation of tinctures: (1) by maceration; (2) by percolation; (3) by solution. Give an example of each process.

Whenever tinctures are to be made by maceration, the Pharmacopœia directs that about three-fourths of the total menstruum be added to the powdered drugs and the mixture set aside, with occasional agitation. The length of time required for maceration varies for different drugs, from two to fourteen days, and is stated in each official formula. At the expiration of the specified time the mixture is filtered through absorbent cotton, and when the liquid has all drained off, sufficient menstruum is passed through the dregs to bring the volume up to the required measure.

Paregoric is made by maceration.

When tinctures are to be made by percolation, the Pharmacopœia directs, with very few exceptions, that the powder having been moistened with the prescribed quantity of menstruum, shall be set aside without being compressed for a period varying from three to twenty-four hours before it is packed in the percolator. Having been properly packed and saturated with menstruum, it is allowed to macerate for twenty-four hours (in a few cases forty-eight hours) before percolation is started. This preliminary treatment is intended to insure more thorough penetration of the cellular tissue by the menstruum, and has been found very effectual in furthering the extraction of the soluble principles sought.

Tincture of gentian compound is made by percolation.

The direct solution process of making tinctures

consists in dissolving the drug directly in the menstruum.

Tincture of ferric chloride is made by solution.

2. Why is tincture of arnica made by maceration and expression? (a) Why is the process of maceration sometimes preferred to percolation? (b) Why should tinctures not be made from fluidextracts?

To exhaust the drug. But it is claimed that equally perfect exhaustion of the arnica flowers can be effected by maceration and percolation. (a) It is preferred for drugs which are more than 50 per cent soluble in the menstruum because these drugs tend to clog if percolation is attempted. (b) The Pharmacopœia directs that they should be made directly from the drug in most instances. It is admitted that there is a difference in physical properties between a tincture made from the drug and one prepared from the fluidextract. There is no reason why tinctures should not be made from fluidextracts. True, there is a little precipitation, but the active principles are not thrown down. In fact, one does better to prepare a tincture from a standardized fluidextract than from the crude drug. Especially is this true of the great majority of fluidextracts which are intended for the preparation of tinctures and which have a menstruum suited to that purpose.

3. What is the distinction between extracts and fluidextracts? (a) Name two fluidextracts made with a menstruum of boiling water. (b) Name two in which acetic acid is used.

Fluidextracts are concentrated alcoholic or hydro-alcoholic solutions of vegetable principles of drugs. Extracts are permanent, soft, solid or dry preparations obtained by evaporating the percolates of the drugs. One is a fluid, the other a solid. (a) Triticum, glycyrrhiza. (b) Lobelia, nux vomica.

4. Name the important solvents used in pharmacy in the order of their value. (a) What is an excipient? (b) Name the most important ones used in making pills. (c) Why should glycerin not be used as a part of the pill excipient if the pill is to be coated with gelatin?

Water, alcohol, glycerin, ether, chloroform, and occasionally diluted acids and alkaline solutions, as well as fixed and volatile oils. (a) An adhesive or absorbent agent used in making pill mass. (b) Glucose, syrup, licorice powder, wheat flour, glycerin. (c) If small quantities of glycerin are used, they do no harm; but a large amount would tend to soften the gelatin.

(To be continued.)

DOLLAR IDEAS.

The editor of the BULLETIN will pay \$1 in cash for every practical idea accepted for this department. What is wanted are good formulas, dispensing kinks, book-keeping suggestions, business plans, advertising schemes, new soda drinks, and everything else of a novel and useful nature.

A DISPENSING CONTAINER FOR OILS.

George W. Haines, Clarkskill, Ind.: What druggist does not remember his experience in filling bottles of castor oil or glycerin, especially during the winter season when the contents were cold? Since growing to manhood I have had the same experience which I believe every druggist or drug clerk has, especially when in haste. After trying the different cans and pumps and giving them up as impractical and inefficient, I stumbled upon

this plan and have found it most convenient for dispensing the different kinds of oils.

The device is clean. There is nothing to get out of order and it can be placed back against the wall and out of the way. Mine is made out of galvanized tin with a capacity of about six gallons, so that it need not go dry before being refilled. The cocks are of the very best brass with large holes so that the heavy liquids will flow easily. The screw-cap is large to permit the use of a large funnel.

An improvement over mine would be to place the large screw-caps on the top after the manner of large gasoline tanks and then dispense with the funnel when refilling.

Place the apparatus about five feet from the floor and against the wall, using as supports slats about $\frac{7}{8}$ by 2, instead of a wide board. This will permit one to set a lamp under the containers in the winter-time to warm them up.

"BRAN PHOSPHATE" FOR THE FOUNTAIN.

J. Weis, St. Paul, Minn.: All conscientious soda dispensers should introduce this healthful drink to their customers, and give them "Wheat Phosphates" in their natural form and not in the shape of a chemical compound. Here is the process of manufacture:

Fill a jar with a quart of clean bran and a quart of pure water, preferably hot, and let it stand over night. Then shake and strain the mixture through a cheese-cloth. Dispense the beverage with lemon juice, but do not spoil the cooling effects of the lemon by adding sugar, a body heater which causes fermentation in weak stomachs.

For a winter drink leave out the lemon. If some insist on having it sweetened, add saccharin or Hoyt's "Sweetness." This is taken from wheat itself and is just as sweet as saccharin. In this drink you also give your patrons the laxative principle of bran, called phytin. With this agent they can avoid eating the sharp-edged, nerve irritating bran chips. By a little experimenting on your part you can give your customers a very healthy drink just according to their taste and make them happy.

A FLUID FOR CLEANING UTENSILS.

R. F. Graves, Plainwell, Mich.: One feature of our business that is particularly objectionable is the cleaning up of graduates and other utensils when they have been used for substances that are not readily removed by water. A pharmacist will often guess at the quantity of some things rather than measure them out because he wants to avoid soiling the graduate with the perverse substance. Here is a cleaning mixture composed of solvents that cut most anything insoluble in water:

Acetone	10 parts.
Benzole	30 parts.
Denatured alcohol	60 parts.

I keep a bottle of this mixture at the sink, and a drachm or two of it will dissolve out any deposit that water will not affect. It doesn't cost much and will do the work almost instantly, even on dried varnish or paint.

LETTERS.

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

HERR BODEMANN AND OTHERS TO THE RESCUE.

To the Editors:

Mr. Chester H. Knowles is wrong in his interpretation of the prescription reproduced on page 126 of the March BULLETIN. "Tinct. ferri pomat." is not tincture of iron and bitter apple. It is iron dissolved in sour apple juice—and made according to various methods. I remember only too well that

*Tinct. ferri pomat 3 1/4"
" Cinnamon 3 ss
" opii extract 3 i
sh. leaf 3 times daily 10
drops*

forty-nine years ago my then preceptor made me do some research work on this product and induced me afterwards to write the subject up for Hager. This first bit of writing was the beginning of my experience in contributing to the journals, and—well, you know the result. It grew to a gruesome degree!

WILHELM BODEMANN.

Chicago, Ill.

To the Editors:

In your March issue Brother Knowles translates "tinct. ferri pomat." as tincture of iron and bitter apple. I should be pleased to have his authority for this, for I did not know that the preparation ever had bitter apple as an ingredient. While tinct. ferri pomat. may not be in general use, it has never been off the boards entirely, and a formula for it will be found on page 179 of the last edition of the N. F.

Galesburg, Ill.

C. H. BURT.

To the Editors:

Referring to the puzzle on page 126 of the March BULLETIN, do you not think the prescriber meant just what he wrote—ferrous malate instead of tinc-

ture of iron and bitter apple? This is a remedy in common use among the German doctors and is frequently combined with cinnamon water. Formulas will be found in both the National Dispensatory and the National Formulary. The European books call the product ext. ferri pomatum. In giving the patient colocynth in this instance I think he got a gizzard twister instead of a simple iron tonic!

Weston, Ohio.

E. A. SAXBY.

[NOTE BY THE EDITORS.—Since the foregoing letters were received and put in type, we had several others of the same general tenor, and we desire to thank our readers for their interest.]

NINE SUGGESTIONS.

To the Editors:

May I submit the following brief methods and ideas for the consideration of yourselves and your readers?

1. Keep postage-stamps and sell them to people who have enough humility or good breeding to ask for them in a decent manner. Don't sell them to any other kind unless you've made a contract with the government. There are times when "you are not in." Let there be times when the "stamps are out."

2. On rainy days flies will congregate in the best regulated stores. On such occasions when you have but few women shoppers use a gun and powder on the flies vigorously. If your insect powder is good and your aim accurate you can kill every fly. "Leave 'em lay" for a while and note how many people will call for "the same kind of powder as that with which you killed these flies."

3. When in doubt as to the amount called for in a prescription written in the metric system, be sensible and use metric weights and measures. Don't become an "exhorter" and try to convert one system into the other. If you haven't any metric weights and measures telegraph for them at once. "Will you order them to-day?" as the ad. writers say.

4. In preparing solutions of corrosive sublimate or other potent drugs, test your containers carefully to see that they have no breaks or leaks. The surest way to detect a flaw is to fill the bottle with water, insert the stopper and shake vigorously.

5. Never question the right of a customer to retain a copy of his prescription. If he requests a second copy at any future time give it to him without argument.

6. Don't be bulldozed. That is, don't let an aggressive, unreasonable customer make a price for

you on your own goods. Make it yourself and make it so fair and reasonable and just that it cannot be called into question by any fair-minded man.

7. If you have any grounds whatever for believing that you will get to heaven some day don't jeopardize that chance by perpetrating the following in one of your ads.: "We lead, others follow." Of course this statement will cause your professional brethren to regard you as a very exalted personage, but be sure that your assertion bears all the earmarks of truth before making it.

8. When you receive a prescription over the 'phone insist upon repeating it to the "phoner." Make him verify each ingredient, each quantity, and the directions.

9. The same rule should apply to orders received over the 'phone. Repeat the order item by item to the customer, get the correct address, and when in doubt ask if the package is to be sent C. O. D. or charged.

CRAWFORD T. RUFF.

Montgomery, Ala.

PROFESSOR REMINGTON ON CANADIAN RECIPROCITY.

Dear Mr. Bulletin:

Reciprocity is in the air, and Detroit is vitally interested.

A few weeks ago the writer found himself on a staunch little steamer—the *Cristobal Colon* on the Caribbean Sea. We had left Nueva Gerona, Isle of Pines, on New Year's eve, bound for Batabano, Cuba. The air was light, but a heavy swell caused the *Colon* to bore through the waves like an auger-bit, as the wind was on the starboard quarter.

A gray-haired Canadian, who took much pride in telling the passengers that he would be eighty-five years old on his next birthday, showed that he was a worthy scion of the Dominion and a living example of the healthfulness of his climate, by wandering all over the boat, interrupting tête-à-têtes, and bothering the deck hands by asking every few minutes, "Where are we now?"

The staterooms on the upper deck were pleasant and cool, but the partitions did not extend to the ceiling, hence a conversation in one room could be heard distinctly in several others.

The old gentleman, like all well advanced in senility, had a fashion of talking aloud to himself,

and, in fact, arguing with an imaginary person, mostly his absent wife.

The motion of the boat, together with the "mal de mer" from which many of the passengers suffered, kept nearly every one awake during the night.

Just before daylight, every one was aroused by an exciting episode which occurred in the old man's stateroom. A Chicago man, who was unfortunate enough to occupy an adjoining room, roared out: "What the — is the matter with you?" The answer came quickly: "I've lost my teeth!"

"What did you do with them?"

"That's what I don't know."

There was a creaking of the bed springs as the fat Chicago man turned in his berth, but his sleepy remark, "Well, I guess you'll find them in the morning," did not satisfy the loser of the teeth.

"I'll have to live on corn-mush until I get home," he wailed, and then came the persistent whining cry of "I've lost my teeth—mush, mush, mush."

This was repeated several times. At last a tremendous bump in the adjoining room indicated that the Chicago man was not so heartless and selfish as the denizens of the Western metropolis are sometimes reputed to be. A sharp double knock on the old man's door, and a quick turning of the key, relieved the minds of the passengers as a gruff voice asked:

"Where did you put your teeth?"

"There in that tumbler; I always take them out every night."

The sharp Chicago eyes glanced tumblerward, and their owner then declared:

"Why, old fellow, there has never been any water in that tumbler."

"Then I'm lost!" wailed Canada.

"Hol' on, hol' on, where's your vest?" demanded Chicago.

"On that nail."

"What's this?" said Chicago, and tremblingly the old man put his shaking fingers in the vest pocket, and there, wrapped in a piece of newspaper, were the missing grinders.

"Well, well! I'm saved from a corn-mush diet!" And as Chicago went out of the room we could hear him mutter: "Well, I'll be —. Some men ought to have guardians."

Now in view of the great question of the hour, Canadian Reciprocity, does this incident have any significance? Reciprocity involves exchange to mutual advantage. Our Chicago friend was not

even thanked. If we are to buy surplus Canadian wheat, will she buy surplus United States corn? For remember that at least one Canadian traveler dreaded a corn-mush diet!

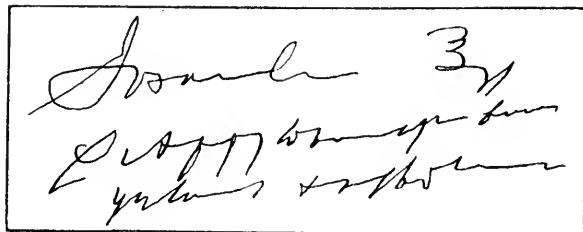

Philadelphia, Pa.

JOSEPH P. REMINGTON.

THAT PRESCRIPTION AGAIN!

To the Editors:

In glancing over the February BULLETIN I note, on page 82, a prescription that has been deciphered by Mr. Raubenheimer of Brooklyn. He thought that the prescription called for: Formalin, 56. To

me it looks more like Iosaline than Formalin, and I should furthermore say that the quantity was two ounces instead of six.

I may explain that this proprietary is manufactured in New York, and that it is often prescribed by specialists like Dr. Greenway of Hot Springs, Ark. Trusting that our "pharmaceutical cryptologist" will take no offense at my correction of his correction, I am,

JACOB S. SEGURA, PH.G.

New Iberia, La.

A CORRECTION.

In this department of the BULLETIN last month we published a very interesting communication entitled "A Simple Method for Testing the Color of Granulated Sugars." The author was L. G. Lelsz, of the Analytical Laboratory of Parke, Davis & Co. in Detroit. Unfortunately Mr. Lelsz's name, as it appeared in the journal, was printed L. G. Lehr, and we are making this correction in order to give Mr. Lelsz full credit for the contribution.

HE DROPS INTO VERSE.

To the Editors:

Your journal's name is "Bulle-tin,"
Such modesty I justly scold,
When searchingly I look within
I find not "tin" but "bully-gold."

North Paterson, N. J.

MAXWELL BUKOFZER.

THE FLORAL DEPARTMENT.

To the Editors:

Have just got settled in my new store building and have 36 feet of good show windows that I want to keep up-to-date by using the BULLETIN as a criterion. I expect something good from the displays in the journal. The BULLETIN is the best ever, and for Heaven's sake never let my subscription expire! I don't want to miss a number. Here's long life and success to the best drug journal among a lot of good ones!

W. W. STOLL.

Fontanelle, Ia.

To the Editors:

Your material in the BULLETIN is O. K. and is appreciated as much by Canadians, I think, as it is on the other side. Long may you prosper in the good work you are doing in the uplifting and elevation of Pharmacy!

K. A. MARGESON.

Vancouver, B. C.

To the Editors:

We take several pharmaceutical publications, but of them all the BULLETIN is our favorite. Its large, clear type, its practical suggestions, and its instructive editorials appeal to an old druggist of 57 years' service.

F. P. GREEN,
Green's Pharmacy.

Bellefonte, Pa.

To the Editors:

I had rather part with the enclosed "Green Dollar William" than with the companionship of the BULLETIN OF PHARMACY during 1911. Therefore enlist me in your vast army of readers.

Pittsburg, Pa.

W. E. RODEMOYER.

To the Editors:

Enclosed find money-order for \$1.00. Wouldn't be without the BULLETIN for several Bones.

Palisade, Colo.

MARK A. CUMMINGS.

To the Editors:

I take four publications, but the BULLETIN is the best of them all!

F. J. CUNNINGHAM.

Chetoka, Kans.

To the Editors:

Must have the BULLETIN above all things.

Paullina, Ia.

W. A. BLAESSER.

PRACTICAL PHARMACY.

A Discussion on Cerates and Ointments.—

At a recent meeting of the Medico-Pharmaceutical Section of the Cleveland Academy of Medicine, L. C. Hopp outlined the work thus far done by Sub-committee 12 of the U. S. P. Revision Committee with a view to securing views of the medical men present. He spoke of the proposition to drop cerates, incorporating the cerate idea in a foot-note under ointments. He suggested the advisability of framing recipes for several ointment bases—simple ointment, a wool-fat petrolatum base, a base similar to cold cream—and using these along with benzoinated lard as bases for the several official ointments instead of varying bases not official. He objected to the recognition of a 33-per-cent mercurial ointment in addition to the 50-per-cent product, raising the question as to whether, if a diluted ointment was required, the 30-per-cent ointments recommended by the Brussels Conference should not be adopted. He considered the 10-per-cent ointments of the two oxides of mercury too strong, and thought that the ointment of phenol was unsatisfactory, both as to base (petrolatum) and strength.

Dr. Corlett, the leading dermatologist of northern Ohio, outlined the history of ointments, classifying them into (a) protective, (b) astringent, (c) stimulating, (d) antiseptic, and (e) penetrative, emphasizing that these several results can be obtained only by intelligent choice of the base. Thus, while scarcely absorbable, petrolatum is an admirable base for a protective ointment, while wool-fat for such purpose would be worthless, and the conditions are exactly reversed if a penetrative ointment is desired. For astringent ointments a wool-fat petrolatum base is the best; for stimulating ointments a wool-fat lard base is indicated; while for an antiseptic ointment, a petrolatum-lard combination is suitable, the proportion of the two ingredients being dependent on the depth to which the antiseptic is to penetrate.

Dr. Corlett has tried all the modern substitutes for ointments—pastes, pencils, mulls, etc.—and has come to the conclusion that, after all, ointments are the most reliable products for skin medication.

As to the proposition to delete the 33-per-cent mercurial ointment, it was pointed out that in Ohio at least no product bearing a pharmacopœial name could be sold unless of pharmacopœial strength, and that as the 33-per-cent mercurial ointment containing petrolatum was intended solely as a non-absorbent vermin killer, while the 50-per-cent form was intended to be absorbed to obtain the constitutional effects of mercury, the two served two entirely different purposes, and each supplied a marked need.

The suggestion to drop the class of cerates, incorporating the idea as a foot-note under ointments, met with general approval, only one negative vote being cast.

A final vote recommended that both ointments of the oxides of mercury be dropped from the next Pharmacopœia, leaving the physician to prescribe strength and base.

Variable Teaspoons a Source of Danger.—

"It is highly desirable," says the *American Druggist*, "that some concerted action should be taken by doctors and druggists to do away with the domestic teaspoon as a medicine measure. Commonly understood to represent a utensil capable of holding sixty minims or one fluidrachm, the capacity of teaspoons varies to an extraordinary extent. The subject is one that has been discussed more than once in the drug press, but little has been accomplished in the direction of influencing physicians to insist upon their patients using a graduated measure, or dose glass, in taking the prescribed amount of medicine.

"Attention has been directed to the subject anew in a paper read before the Brooklyn Pharmaceutical Association by J. Leon Lascoff. The variations in the capacity of teaspoons were impressed on him after having dispensed a prescription containing one-quarter of a grain of morphine in each drachm of the mixture. After the patient had taken a few doses he called up the dispenser on the telephone to tell him of the uncomfortable symptoms that had developed, saying that he felt himself going under the influence of a sleeping draught. Mr. Lascoff suspected the teaspoon and asked to see it. Upon its being produced and measured it was found to hold 110 minims, so that the patient had taken nearly double the dose of morphine prescribed. The necessity is obvious of physicians insisting on the use of accurately marked medicine glasses or glass graduates marked in minims for the measuring of doses by their patients."

A Lot of Money Lost Here.—

E. W. Spony is responsible for the following little tale. Writing in the *American Druggist* he cites the incident by way of illustrating how a druggist may sometimes gain publicity without expense. To quote:

"In a large city a storekeeper on his way to open up his store one morning, hit upon the idea that people would be interested in the fact that he had found some money and wanted to return it to the proper owner. Forthwith he lettered a sign stating that he had found some money, and if the loser would state the amount he or she had lost and the location, so far as could be guessed, the dealer would be pleased to return it.

"During that day many persons visited the store, and many declared that they had lost various sums, ranging from 50 cents to \$50. The dealer made note of each of the losses, stating at the same time to the unfortunates that he was not the finder of their losses.

"At the close of the day he totaled up the amount said to have been lost, and came to the conclusion that \$864.39 was missing in the neighborhood or that he had been the unconscious promoter of a guessing contest. He removed the sign from his window in which he offered to return the money found, and substituted in its place one which read, '\$864.39 has been lost in the neighborhood of this store. I found 10 cents of it.' This sign elicited some good-natured humor from the regular patrons of the store."

BUSINESS HINTS.

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

A Readable Ad.—

W. H. Cousins, of Wichita Falls, Texas, is a man of unique individuality. He never says anything quite as anybody else would say it. One of his newspaper ads., borrowed from the *Practical Druggist*, is reproduced herewith, and

SHAKESPEARE

is on record as having said, "Throw physic to the dogs." But during the régime of this venerable rhymster applied therapeutics was in its embryonic state, the germ theory of disease was stoutly denied by the most eminent practitioners of the healing art, serum therapy was several hundred years in the future, and antiseptic surgery was unknown. A modern drug store or physician's office at the time would have been about as commonplace as an aeroplane at the battle of Marathon, and in this swift day of aerial navigation, speed craze and hobble skirts, to keep in touch with what is doing in the medical and pharmaceutical world means eternal vigilance and study that comes as regularly as rent and tax. Outside of Pharmacy, I do not know the way home, but pill making is my mission on earth, and on this subject I have coppered all the information that has been handed out.

W. H. COUSINS

Head Fiend

at That Fussy Pill Plant on Eighth St.

while it may not have brought much business it must surely have been read. And if it was read it attracted attention, and to attract attention is the first function of advertising matter.

Advertising a Sunday-closing Decision.—

The Owl Drug Co. on the Pacific coast, with a chain of 14 stores in San Francisco, Oakland, Los Angeles, Seattle, and Portland, has recently taken the decision of closing its stores on Sunday afternoon. We are reproducing an advertisement which the company inserted simultaneously in all the daily newspapers of San Francisco, Oakland and Los Angeles relative to closing all its California stores from one to six o'clock on Sunday. With a firm of large dealers like this assisting, it has been much easier for druggists in general in those particular cities to get together on a Sunday-closing agreement.

Incidentally we may say that the Owl Drug Co. has adopted

a bonus plan for the encouragement and retention of its many clerks. At the end of one year's service the bonus will amount to 1 per cent of the annual salary, at the end of

ANNOUNCEMENT

Sunday Afternoon Closing

BEGINNING Tomorrow, Sunday, January 22, 1911, The Owl Drug Co.'s Stores in San Francisco, Oakland and Los Angeles will be closed every Sunday from 1 to 6 P. M. This Sunday afternoon for recreation will be additional to the one day each week our employees have heretofore been receiving. While already extending to our employees many advantages in shorter hours and better salaries than ordinarily prevails in drug stores, this company believes that this reform in its service hours, heretofore regarded as impractical, must necessarily result in securing to the public immeasurably better service during the hours that our stores are open. Though the many patrons of this company, accustomed as they are to finding drug stores open every day, may not appreciate what this innovation means, their sense of fairness will undoubtedly convince them that the plan of closing Sunday afternoon is worthy of their indorsement. The Owl Drug Company is confident that this closing will make it possible for proprietors of smaller establishments to likewise close during the same hours. We respectfully solicit the assistance and co-operation of our patrons and the patrons of other dealers in making this new plan successful and permanent.

THE OWL DRUG CO..

two years' service 2 per cent, at the end of three years' service 3 per cent, at the end of four years' service 4 per cent, and at the end of five years' service and thereafter 5 per cent. This bonus plan does not take the place of increases in salary, but is in reality an addition thereto. Every concern, as it grows larger, finds it more and more necessary to enlist the hearty coöperation of its employees, and experience has shown that some form of profit-sharing, or reward for loyal service performed, is sure to bring excellent results.

A Letter to the Doctor on Salvarsan.—

Leonard A. Seltzer, a prominent Detroit pharmacist, has made a special study of Salvarsan, or "606," Ehrlich's new remedy for syphilis. Having mastered the process of dispensing the difficult chemical, Mr. Seltzer took pains to let the physicians know it. Here is a letter which he wrote them:

DEAR DOCTOR:

The success of "606" is in a great measure dependent upon its careful and skilful preparation.

The danger of untoward effects is largely due to the possibility of toxic oxidation products, which have a tendency to form rapidly during the process of preparation. The possibility of such toxic products can be easily conceived when the fact is taken into account that there is more metallic arsenic in one dose of Salvarsan than is contained in a full ounce of Fowler's Solution.

We have developed a technique in the preparation of "606," a feature of which is rapidity of manipulation, thus insuring against toxic action, and at the same time producing a smooth and much less painful injection.

"606" is supplied in absolutely sterile, sealed ampoules, all ready for injection. It is prepared to order and delivered at any hour to any address.

For those who wish to prepare "606" themselves, we supply Salvarsan in original packages at trade prices.

Very respectfully yours,
LEONARD A. SELTZER.

That the foregoing letter proved a bit of good, ethical advertising goes without saying.

A Druggist Who Knows How to Write an Ad.—

There is a clever druggist down in Asheville, N. C. His name is MacKay, and some of his ancestors must have emanated from Scotland. At any rate, this man knows how to write advertising matter, and to prove it we are going to print *in toto* the text of a circular which he recently issued:

This makes a suitable time for me to *confess*.

I have a hobby.

It concerns every man, woman, and child in town.

My hobby is—but wait a moment.

Suppose you are sick, or one of your family is sick.

You consult the best physician you know of and he gives you a prescription.

You have a right to take that prescription to any druggist, no matter whose name is printed on it.

You have the same right to select your druggist that you do to select your doctor.

Particular people bring their prescriptions to me, because my "hobby" is *prescription work*.

I take the same sort of pride in compounding every prescription the very best way, that an artist takes in painting the very best picture he can; the same that the conscientious doctor takes in bringing his patients back to health.

I know drugs; I know where to buy the best.

I get that kind, and I don't depend on appearances.

I use chemical tests.

Appearances are deceptive. Two phonograph records look exactly alike, but the phonograph gets a \$1,000 Melba song from one and a rag-time two-step from the other. So, with drugs, the inferior may look as good as the best.

My hobby leads me to study each prescription to make it give the right results.

There is no rule of thumb, no guessing—simply accurate, scientific work done by a man who knows and loves his profession.

If there is any surer way than this, I can't imagine what it is.

And besides—any physician who knows me will tell you—"MacKay does things right."

The best way for you to know, is for you to bring your next pre-

scription here, where such work is not regarded as a drudgery or necessary evil, or as a good chance to get a big price for something—but where it is a "hobby"—where it is looked upon as the most important service I can render to my fellow-man.

The price! I haven't said anything about price. That won't bother you for a moment. Our prices for prescriptions are as low as the quality of material and workmanship will permit, and therefore should not be unjustly compared with those carelessly compounded from drugs that are inert and of doubtful origin.

When you have a prescription, remember my hobby. Remember too that I will call for your prescriptions and deliver the medicine—

Phone me at any hour.

Cordially yours,

D. MAC N. MACKAY, Prescription Specialist,

Proprietor MACKAY'S PHARMACY,

OPPO. POSTOFFICE

Phone 556

The foregoing text was printed on the two inside pages of a small four-page circular. On the first or cover page was merely this title: "A Confession." Pretty good stuff, isn't it?

An Attractive Circular.—

The B. F. Gallant Pharmacy, Bellevue and Downer Avenues, Milwaukee, Wis., have just gotten out a six-page folder illustrating their establishment. The three inside pages of the folder we are reproducing in the accompanying cut, and it will be seen that this piece of advertising is quite unusual in character. The service provided by the Gallant Pharmacy is evidently superior and the store itself is a beauty. The circular is entitled "The Ultra Sanitary Pharmacy." The size of the folder when open is 7½ by 12½ inches, and it folds twice. The stock is an India tint, and the cuts and text matter are printed in black and red. Altogether the thing is gotten up very artistically.

MILWAUKEE'S FINEST, MOST MODERN SANITARY DRUG STORE

MOTTO: WHAT WE OFFER FOR SALE WE GUARANTEE. IS IT THE PRICE? OR WHAT WE GET FOR THE PRICE?

Built entirely of German silver and marble—the conditions under which we serve at this fountain are most inviting. Large handlers of fine ice creams. Orders taken and delivered for all occasions. Fountain in operation all seasons.

PRESCRIPTION DEPARTMENT

"Double-check" system used exclusively in all prescriptions compounded. Where special preparations are indicated in prescription work—these are prepared fresh in our laboratories by our own chemist—thus assuring the physician and patient of strict observance to their requirements.

For medical purposes we carry nothing but the highest grade of liquors bottled direct from barrels. Rare wines, cordials, champagne.

Our assortment of rare and imported toilet articles cannot be surpassed. Imported direct from world's most famous chemists. We stock room supplies of every description. We supply several hospitals. Direct importers of fine Italian and French olive oil. Imported and domestic cigars.

LABORATORY

Our laboratories are in charge of pharmacists of long experience, and every preparation is subject in practice and scientific scrutiny.

PRESCRIPTION DEPARTMENT

Inspection of prescriptions department is insured at all times to physicians and patients. No other prescriptions are compounded here. All drugs are kept and preserved from deteriorating influences which might retard their efficiency.

BOOKS.

TWO BOOKS ON THE CARE AND FEEDING OF INFANTS.

"A Treatise on Feeding and Nursing the Baby" is the title of a volume by Charles Douglas, M.D., a prominent and successful Detroit specialist in the diseases of children. The book is popular in character, is written for mothers and nurses themselves, and is filled from beginning to end with practical suggestions and advice of a thousand and one kinds. Every possible phase of the subject is discussed in simple, clear language, and mothers may turn to the book with the assurance of getting light and help on every new problem and baffling experience.

Beginning with the pregnant woman, the treatise passes on to consider childbirth, the question of nursing, the different systems of feeding suited to different infants, the care of the baby, the conditions best tending to proper development, the common diseases and their diagnosis and significance, the home treatment of ordinary difficulties and troubles, accidents and emergencies, drugs and their dosage and use, and the preparation of foods of every sort and character. Everything is described with fulness and care, and the aim of the author is to point the way for the growth of strong, healthy, well-developed children. The book contains 611 pages, is bound in cloth, and costs \$2.00. The publishers are the Baby Book Company, Detroit, Michigan.

"Feeding Rules for Healthy Infants" is a second volume which has grown out of experience with earlier editions of the first, and is exclusively devoted to a more extended presentation of the subject of feeding and nutrition in all its phases. The book contains 279 pages, costs \$1.00, and is published by the same house. Either or both of these books would be found of inestimable value to every mother, and they can scarcely be commended too highly.

"FOODS AND THEIR ADULTERATIONS."

In reading the new and revised edition of this important work we are impressed with the vast amount of information which it must disseminate on the subject of foodstuffs. The author, Harvey W. Wiley, Ph.D., through his position as chief chemist of the U. S. Department of Agriculture, has had every chance to become a master of this field. How well he has succeeded is evident from the book itself. It does much to enlighten not only the scientific but also the lay mind on the important question of nutrition.

The volume treats of the origin, manufacture, and composition of food products. There has been added, too, a carefully prepared article on infant and invalids' foods, which describes their preparation and use, and which is calculated to impress upon people having the care of invalids the great importance of feeding. Of course the detection of common adulterations and food standards are treated in a very comprehensive way. In general, Dr. Wiley's book will appeal to every human being interested in the broad study of hygiene. It contains a great deal of information about nutritive values and the use of food for bodily nourish-

ment that will be especially helpful to the householder. As for manufacturers and dealers in foodstuffs, they can hardly afford to be without Dr. Wiley's work.

There are 641 pages with 11 colored plates and 87 other illustrations. The price is \$4.00 in cloth.

A NEW BOOK OF FORMULAS.

"The Scientific American Cyclopedia of Formulas" has just come from the press of Munn & Co., 361 Broadway, New York City, publishers of the *Scientific American*. This book is a successor to the well-known volume entitled "Scientific American Cyclopedia of Receipts, Notes, and Queries"—a volume which has proved to be one of the most comprehensive and accurate books of formulas ever issued. The new work has been brought up to date, has been supplied with a lot of new material, and contains no fewer than 15,000 recipes of one kind and another. Every possible want is covered, and processes and formulas are given for cements, dyes, insecticides, lubricants, paints, photographic specialties, water-proofing substances, soaps, soldering materials, alloys, and pretty much everything else under the sun. A new chapter has been incorporated on chemical, pharmaceutical, and technical manipulation, which has been prepared with the aid of prominent chemists. The index in this new volume is particularly worthy of commendation. The book contains 1077 pages, is bound in cloth, and the price is \$5.00 net.

THE MODERN MATERIA MEDICA.

The second edition of a book with the foregoing title has been issued from the press of the *Druggists Circular*, 100 William Street, New York City. As with the first edition, this is a reprint of matter which has appeared in the journal from month to month. Several hundred (or perhaps thousand) of the newer chemical remedies and synthetics are alphabetically listed and described. A feature of the present edition is that the name and address of the manufacturers are also given. The description of each product is brief and yet sufficiently comprehensive for the information of the average pharmacist. Certain it is that every druggist needs some such book, for during the last decade or more the materia medica has been very largely made up of newer chemical products, many of which are not yet mentioned in the text and reference books. The present volume contains 432 pages and the price is \$1.25.

REVISION OF THE GENUS EUCALYPTUS.

J. H. Maiden, F.L.S., has published Part XII of "A Critical Revision of the Genus Eucalyptus." This number is vol. 2, part 2, or part xii of the entire work. Ten species are fully described, giving synonyms, affinities, and range, together with much supplementary information. There are four plates accompanying the text. This is a highly interesting group of plants as well as a most important one economically, and the treatment it is receiving by Mr. Maiden will undoubtedly be exhaustive and the most authoritative for many years to come. It is published by William Applegate Gullick, Sydney, Australia, for the government.

CAPSULES OF SCIENCE.

Prepared by Prof. W. L. SCOVILLE.

Quick-lunch Items.—

Fruit may be prematurely ripened by killing or stimulating the protoplasm by chemicals, such as the vapor of acetic acid, but in most cases the flavor is not good.

Danne says that the supply of natural gas in the United States threatens to become exhausted in twenty to fifty years. He thinks that nearly 60 per cent of the present supply is wasted, only 40 per cent being used.

Refined petroleum dissolves about 0.003 per cent of water, and petroleum oil about 0.003 per cent, at 15° C. The solubility increases with rise in temperature.

Barium oxide in glass increases its density and elasticity, and decreases its tendency to break when heated quickly, hence is specially useful in glass chimneys.

E. Ebler has obtained seven-thousandths of a grain of metallic radium, after weeks of work, and from it proves that radium has properties analogous to metallic barium.

Purified lampblack will remain suspended in water for months, but it takes a month to purify it sufficiently to accomplish this result.

Iodine gives a color with dextrin more quickly than with starch, and in greater dilutions, but the color is reddish instead of blue.

Clear, Clearer, Sterilized!—

Calcium permanganate is stated to be better than alum for clarifying reservoir and river waters, and it sterilizes at the same time. It decomposes in the water to form calcium hydroxide, manganese dioxide, and free oxygen. It must not be used in excess, but this is easily regulated by the color.

Ergot Some More.—

W. T. Wenzell has discovered another principle in ergot which he calls *ergoxanthine*. It is a yellow coloring matter, but is physiologically active, increasing the blood-pressure and slowing the heart.

A Distinction.—

W. Macadie, Ph.C., says that pure adrenalin is easily oxidized, but that the hydrochloride is not. He says that discoloration in adrenalin hydrochloride solutions is due to the action of ammonia, which first frees adrenalin, then forms a colored compound with it.

One Germ's Food—Another's Poison.—

Three English bacteriologists find that some bacteria found in water will oxidize phenol and apparently will thrive on it. The disinfectant properties of the phenol appear to be destroyed by the action.

A Niagara Rival.—

Professor Tolman has proved that in making a solution of an electrolyte an electromotive force is developed in the dissociation of the salt, thus furnishing a direct proof that electric dissociation takes place in salt solutions.

Oh, You Seaweed!—

A new substitute for gum and gelatin is the soluble sodium-ammonium salt of laminaric acid, which is obtained on a manufacturing scale from the seaweeds of the North Atlantic. It swells in water, forming a brownish-yellow colloidal solution possessing a high viscosity and adhesive properties equal to tragacanth. It is being introduced commercially under the name "Norgine" as a new sizing agent.

Koumiss, Not Miss-cow.—

B. Rubinsky says that true koumiss can be prepared from mare's or camel's milk, but not from cow's milk, because the proteins of cow's milk are not peptonized by the koumiss ferment, while those of mare's and camel's milk are. Normal koumiss contains 0.5 to 0.8 per cent of lactic acid and 0.7 to 2 per cent of alcohol, and the protein is entirely changed in character, being partly peptonized.

Cheap Emulsions.—

Professor Pickering says that basic sulphates of copper, iron, nickel, zinc, and aluminum, by adding lime to the normal sulphates, produce true emulsions of oil and water, which are permanent. Thus 1 grain of ferrous sulphate precipitated by lime will emulsify 200 Cc. of oil in 3000 Cc. of water, or 100 Cc. of oil in 400 Cc. of water, or 30 Cc. of oil in 20 Cc. of water.

Tungsten Jelly.—

In the manufacture of tungsten filaments for incandescent lights, a colloidal solution of tungsten containing 40 per cent of the metal is first formed. One-tenth per cent of ammonium chloride is sufficient to precipitate all of the tungsten from this solution in a gelatinous form which can be molded into filaments.

Paralyzed, Dead, Embalmed—Resurrected!—

Alcohol is found to act on enzyme ferments in three ways: 20 to 30 per cent inhibits their action, but the action is restored by dilution; 30 per cent to the precipitating strength destroys the enzyme; and strong alcohol precipitates it, the precipitate being reactivated when dissolved in a nutrient solution.

Try It On the Dog.—

A German chemist has found that the power of morphine habitué to take large doses of morphine is due partly to an acquired toleration of the tissues, and partly to an ever-increasing power of decomposing the morphine within the body.

The Why and Wherefore.—

P. Rohland says that powders of a colloidal character will remain suspended in water for days, but that powders of the crystalloid class, however fine, will settle quickly; but a film of colloidal character over crystalloid particles will hold the latter in suspension.

Cheaper Camphor.—

There are now 3500 camphor trees in German East Africa, from which camphor is obtained by distilling the leaves. The average yield from leaves and twigs is one per cent. This source of camphor will cut a figure in the market in years to come.

QUERIES.

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Figuring Alcohol Percentages.

W. A. A. submits three formulas with the request that we tell the percentages of alcohol in the finished preparations and the method of determining them.

In printing the formulas we are indicating, after each ingredient, the quantity; also the per cent and content of absolute alcohol.

	Per cent of abs. alc.	Amount of abs. alc.
(1) Chloroform, 4 drachms.....	0.5	1.2 minims.
Paregoric, 4 ounces.....	44.0	14.08 drachms.
Syrup of ipecac, 3 ounces.....	2.0	0.48 drachms.
Hive syrup, 4 ounces.....	2.0	0.64 drachms.
Syrup of wild cherry, 20 ounces.		
Solution of ammonium chloride,		
8 ounces.		
Syrup of licorice, enough to make		
½ gal. (1 pint 8½ ounces)....	3.6	.882 ounces.

In ½-gallon of the finished mixture there is, therefore, the sum of the alcoholic contents of the ingredients or 22 drachms, 16.56 minims. One-half gallon equals 512 drachms. Therefore $(22\frac{1}{4} \div 512) = 0.0434$, or 4.345 per cent of absolute alcohol. In such problems some are accustomed to reducing all the quantities to minims, but that is arbitrary.

	Per cent of abs. alc.	Amount of abs. alc.
(2) Quince seed, 3 ounces.		
Boric acid, 1 drachm.		
Glycerin, 24 ounces.		
Alcohol, 24 ounces.....	95	10944 minims.
Tincture of benzoin, 1 ounce.....	80	384 minims.
Extract of violet, 2 ounces.....	65	624 minims.
Water, enough to make 1 gallon.		

Proceeding, $(10944 + 384 + 624) \div (128 \times 480)$ or $11952 \div 61440 = 0.1945$, or 19.45 per cent of absolute alcohol.

	Per cent of abs. alc.	Amount of abs. alc.
(3) Quinine sulphate, 20 grains.		
Resorcin, 60 grains.		
Glycerin, 4 fluidrachms.		
Tincture of cantharides, 2		
fluidrachms	90	108 minims.
Tincture of capsicum, 2		
fluidrachms	87	104.4 minims.
Cologne water, ½ fluidounce.....	65	156 minims.
Alcohol, 4½ fluidounces.....	95	2052 minims.
Water, enough to make one pint,		
10 fluidounces.		

Dividing $(108 + 104.4 + 156 + 2052)$ by 12480 we get 19.39 per cent of absolute alcohol.

Diluting Acetic Acid: A Percentage Problem.

W. C. H. submits a rather pointed question. He asks: "In what proportions would you mix glacial acetic acid 80 per cent and water so as to make a 36-per-cent acid? According to an article I saw in a magazine some time ago, it would take nine ounces of 80 per cent and 16 ounces of water. Is that right? In Remington's Pharmacy is a similar example,

and figuring it according to that, it would take nine ounces of the one and eleven of the other. Which is right?"

Here is the calculation:

80% acid	}	36% acid	{ 36 parts = 9
0% water			
9 oz. by wt. 80% acid	}		To make 36% acid.
11 oz. by wt. water			

The mistaken statement that 9 ounces of 80-per-cent acid and 16 ounces of water are needed has evidently been made by calculating on a basis of glacial acid 100 per cent, as follows:

100% acid	}	36% acid	{	36 parts = 9 parts.
0% water				64 parts = 16 parts.

Eighty-per-cent acetic acid is not glacial.

Stock Dips.

W. D. Co.—The following formula for a sheep dip is recommended by the United States Department of Agriculture. It should be generally serviceable for stock:

Soap.....	1 pound.
Crude carbolic acid.....	1 pint.
Water	50 gallons.

Dissolve the soap in a gallon or more of boiling water, add the acid, and stir thoroughly.

The following formulas have been approved by the British Board of Agriculture:

LIME AND SULPHUR DIP.

Mix 25 pounds of sulphur with 12½ pounds of good quick-lime. Triturate the mixture with water to a smooth cream and transfer this to a boiler of 20 gallons capacity. Make up the volume with water to 20 gallons, boil and stir during half an hour, when the liquid should have a dark-red color. If yellowish, continue the boiling until the dark-red color is obtained, keeping the volume at 20 gallons. When the liquid is cooked decant off from any small quantity of insoluble residue and make up the volume to 100 gallons with water.

CARBOLIC ACID AND SOFT SOAP DIP.

Dissolve 5 pounds of good soft soap, with gentle warming, in 3 quarts of good crude carbolic acid. Mix the liquid with sufficient water to make 100 gallons.

Compound Liniment of Camphor.

W. A. M. wants a formula of an antiseptic liniment for internal and external use. While we do not know the composition of the proprietary mixture that he mentions, we suggest the following formula:

Camphor	2 ounces av.
Capsicum, powder.....	½ ounce av.
Oil of origanum.....	1 fluidounce.
Oil of hemlock.....	1 fluidounce.
Oil of sassafras.....	2 fluidrachms.
Oil of cajuput.....	2 fluidrachms.
Oil of turpentine.....	1 fluidrachm.
Alcohol	16 fluidounces.

Mix, macerate for 14 days, and filter in a well-covered funnel.

This is recommended for both external and internal use.

It is used in chronic rheumatism, bruises, sprains, chilblains, lameness, etc. In ordinary cases, rub in well several times, then wrap in warm flannel. Internally take 20 drops on sugar. In severe and obstinate cases, bathe the parts as directed, apply flannel, and keep the latter moist with the liniment. In case of toothache, apply a small quantity of the liquid to the hollow of the tooth on a piece of cotton. If the face is swollen, apply some of the liquid externally.

The Term "For Technical Use."

G. A. C. submits the following: "We frequently receive packages of chemicals labeled 'For Technical Use.' Will you kindly inform me just what is meant by the phrase?"

This term implies that a given article is not intended for medicinal use and is not in conformity with medicinal requirements. Chemicals so labeled are intended for employment in industrial arts, and to use this phrase exempts them from the necessity of conforming to U. S. P. requirements.

The U. S. P. standards and the food and drug laws affect substances only when used for medicinal purposes. The Federal food and drugs act, for instance, has no jurisdiction over any product not used in medicine. From the above you will learn that a pharmacopoeial substance may be sold for industrial use without being of the U. S. P. degree of purity—providing the phrase "For technical use" is plainly printed on the label. But be careful that such substances are not employed in medicine, for it is doubtless true that in most instances they are not in conformity with the U. S. P. requirements.

Moth Powders.

O. H. L. writes: "Please publish a good formula for a moth killer that can be made without any special apparatus. I want one that can be used to sprinkle the carpet as it lays on the floor."

Drench the carpet with gasoline or benzine, which will

Where the Bulletin of Pharmacy is Printed.

Where the advertisements are set up and the forms made up for the presses.

Some of the cylinder presses on which the Bulletin of Pharmacy is printed.

A section of the pressroom showing the job presses.

destroy all larvæ. They have the advantage of evaporating quickly, but must be used with care for fear of fire. Compound solution of cresol in 1- or 2-per-cent solution should be effective, although the coal-tar smell will persist for a day or two. If a moth powder were not intolerable, the following mixture could be used:

Naphthalin	8 ounces av.
Orris root.....	2 ounces av.
Patchouli herb.....	2 ounces av.
Camphor	2 ounces av.

Reduce all to powder and mix well.

Santal and Saw Palmetto Elixir.

H. E. D.—We do not know the composition of the proprietary mixture which you mention, but the following formulas have been suggested:

- (1) Saw palmetto.....½ ounce av.
Yellow sandalwood.....1 ounce av.
Couch-grass1 ounce av.
Alcohol,
Water, of each.....sufficient.
Sugar.....3½ ounces av.

Extract the three drugs reduced to coarse powder with a mixture of 1 part of alcohol and 3 parts of water so as to obtain 14 fluidounces, and in the latter dissolve the sugar by agitation.

- (2) Take of
Saw palmetto berries.....8 ounces.
Corn-silk8 ounces.
Sandalwood2 ounces.
Sugar6 ounces.
Alcohol,
Water, each enough to make.....2 pints.

Mix twelve fluidounces of alcohol with thirty-six fluidounces of water. With this menstruum moisten the previously ground drugs and macerate during twenty-four hours. Then pack firmly in a percolator and pour on the remainder of the menstruum, allowing the percolate to drop slowly. In this dissolve the sugar by agitation. Finally pass sufficient water through the exhausted drugs to make the finished elixir measure two pints. Caramel may be added if the color is not deep enough. Each fluidounce of this elixir is taken to represent saw palmetto berries, 120 grains; corn-silk, 120 grains; sandalwood, 30 grains.

Hektograph Inks.

G. L.—Here are a few formulas of hektograph inks:

BLACK.

- (1) Methyl violet10 parts.
Nigrosine20 parts.
Glycerin30 parts.
Gum arabic5 parts.
Alcohol60 parts.
- (2) Nigrosine black1 part.
Water14 parts.
Glycerin4 parts.

This will make a black ink suitable for use with the hektograph. In order to make it copy add more glycerin, gum arabic, or sugar.

BLUE.

Resorcin blue, M.....	10 parts.
Dilute acetic acid.....	1 part.
Water	85 parts.
Glycerin	4 parts.
Alcohol	10 parts.

Dissolve by the aid of heat.

Soothing Syrup.

W. A. M.—We do not know the composition of the proprietary soothing syrup which you mention, but the following formulas are found in the literature:

Anise	1¼ ounces av.
Fennel	½ ounce av.
Caraway	½ ounce av.
Lupulin	120 grains.
Ginger	25 grains.
Lactucarium	30 grains.
Diluted alcohol.....	sufficient.
Simple syrup.....	21 fluidounces.

Mix the drugs, reduce to powder, percolate with diluted alcohol so as to obtain 9 fluidounces of the product, and to this add the syrup.

Anise	1¼ ounces av.
Fennel	½ ounce av.
Lactucarium	25 grains.
Hops	120 grains.
Diluted alcohol	9 fluidounces.
Simple syrup, enough to make.....	30 fluidounces.

Mix the drugs, reduce to powder, percolate with diluted alcohol, and add the syrup.

Soap-bubble Liquids.

E. B. B. asks: "What can be added to a soap solution that will make the bubbles so tough that they will remain intact and can be juggled around?"

Every time one blows a nice bubble, one of the large, iridescent kind, it is apt to collapse at the slightest touch. But believing in bubbles just the same, we submit the following formulas for the soap liquid:

White hard soap.....	25 parts.
Glycerin	15 parts.
Water	1000 parts.
Dry Castile soap.....	2 parts.
Glycerin	30 parts.
Water	40 parts.

Just how much juggling the spheres will stand we can't tell.

A Kerosene Liniment.

A. H. F. wants a formula for a kerosene liniment which he says is good for rheumatism.

Here is one:

Capsicum, powder.....	60 grains.
Fusel oil.....	4 fluidrachms.
Oil of origanum.....	4 fluidrachms.
Oil of sassafras.....	1 fluidounce.
Oil of turpentine.....	8 fluidounces.
Kerosene oil.....	38 fluidounces.

Mix the whole, macerate for 24 hours, and strain through muslin.

Anti-Kink Hair Pomade.

J. L. F. and S. E.—To take the kink out of the hair and straighten it, we suggest what is known as Anti-Kink Hair Pomade:

Beef suet.....	16 ounces av.
Yellow wax	2 ounces av.
Castor oil	2 ounces av.
Benzoic acid	10 grains.
Oil of lemon.....	1 fluidrachm.
Oil of cassia.....	15 drops.

Mix the suet and wax, add the castor oil and acid, allow the mixture to cool somewhat, and incorporate the other oils.

"Healing Oil."

H. R. H.—We do not know the composition of the proprietary mixture which you mention, but you might try the following formula:

Menthol	2 parts.
Phenol	1 part.
Camphor	3 parts.
Cottonseed oil	94 parts.

Triturate the first three ingredients together and then rub up the resulting liquid with the cottonseed oil.

A Green Coloring Agent for Salve.

D. J. H. asks: "What is the best agent to impart a green color to salve?"

If the salve is yellow, use a little Prussian blue. The resultant color is green. If the ointment is white, use an oil-green soluble, obtainable from any dye house.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., MAY, 1911.

No. 5.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

THE MONTH'S HISTORY.

THE CONTRACT PLAN KILLED?

The decision of the United States Supreme Court in the Miles case has proved a startling and unwelcome surprise. Apparently it does away with every form of contract and rebate plan by which the manufacturer seeks to control the price of his products. Something may still be left from the wreck, but if so this will be determined after legal minds have analyzed the decision with more care, and particularly after new plans have been devised and subjected to the test of court construction.

The court held in effect that while the manufacturer of a patented article had proprietary rights which he could utilize in the control of prices, no such rights existed with the owners of secret reme-

dies, which, while they are colloquially called "patent medicines," of course have never been patented at all. With such substances the Miles contract was declared to be an unreasonable restraint of trade, and the court intimated that this would be true whether the title of the goods nominally remained with the manufacturer or was passed along to the venders. Only one member of the court, Mr. Justice Holmes, dissented from the majority opinion, and his view was that the Miles contract could be made legally sound by a slight change making wholesalers and retailers the legal agents of the company—a scheme which has all along been followed by the Freeman Company. It would seem, however, that the other members of the court do not agree with Justice Holmes in this contention.

If it turns out, as now seems likely, that the decision of the court does away with all price-restrictive plans, it does not follow that everything has gone to the demnition bow-wows. As several of our contemporaries have already pointed out, a change has come over the spirit of trade during the last ten or twelve years, particularly among pharmacists, and there is nothing like so much of a tendency in evidence to cut and slash prices. We need only remind our readers that for a time the Indianapolis decision was thought to be little less than a death-blow, but the drug trade quickly adapted itself to the changed situation and suffered little or no ill consequences.

* * *

THE "WORLD" SENSATION.

The sensational charges brought by the *New York World* are still echoing and reverberating, although with somewhat lessened intensity. While the thing was a novelty the *World* devoted from one to three columns a day to it, embellishing its stories with pen-and-ink drawings of some of the druggists and others figuring in the drama. People soon tire, however, of an overworked sensation, and the *World* is now looking for new muck in which to revel.

It was charged at first that the 300 prescriptions dispensed in different stores and purchased by a reporter of the *World*, were found in nearly 50 per cent of the cases to contain medicines deviating in one way or another from the standards. The greatest deficiencies were found in those tinctures and fluidextracts which were subjected to chemical or physiological assay. It turned out afterwards, however, that there were extenuating circumstances in many instances, and at any rate the authorities were able to bring prosecutions against but very few of the druggists. One druggist, it seems, mistook "rub. iodi." for "syr. rubi. idæ.," and so dispensed a solution of raspberry syrup, and the prescription was so illegibly written that he could scarcely be blamed for making this error. Consequently his prosecution in court for dispensing a prescription of rubidium iodide in which there was no rubidium, and the analysis of the chemist showing an entire absence of the metal, fell rather flat.

So far, of course, as the charges brought by the *World* are justified in fact, they teach the moral that druggists can be none too careful in the purchase of their medicinal supplies. Tinctures and fluidextracts for which standards are provided by the Pharmacopœia should bear the labels of responsible manufacturers who are known to be over-punctilious in the matter of standardization. Prof. Virgil Coblentz was employed by the *World* to make the analyses of the 300 prescriptions, and since the crusade began he has resigned from his professorship in the New York College of Pharmacy to become chief chemist of E. R. Squibb & Sons. It is declared, however, that the *World* sensation had nothing to do with his resignation. The H. K. Mulford Co. of Philadelphia made some of the analyses for Professor Coblentz, entirely ignorant of what use was to be made of the findings, and they were very much chagrined afterwards when they found that they had unconsciously played into the hands of newspaper sensationalists at the expense of the retail trade.

* * *

FOOD AND DRUGS ACT CONSTITUTIONAL.

The decision in the Lehn & Fink case has attracted a good deal of interest. The United States Circuit Court held, somewhat to the surprise of certain constitutional lawyers, that the food and drugs act was not unconstitutional because it provided that future editions of the N. F. and the U. S. P. should automatically become standards under the law.

Lehn & Fink contended that this was a delegation of legislative authority, and it was so held to be with respect to the Ohio statute ten or fifteen years ago. The present court declared, however, that the food and drugs act merely decreed that medicines must conform to the implied standards under which they were sold; that if they were sold under the titles of the Pharmacopœia and the N. F., they must accordingly conform to the U. S. P. or the N. F. standards, whatever those standards may be and whenever established; and that this constituted on the part of Congress no delegation of its legislative functions. This is rather adroit reasoning, but of course everybody hopes that in the interests of pure food and drug legislation it will be found good law.

Another point raised by Lehn & Fink was that a shipment of goods might be seized at a time when one Pharmacopœia was in effect; that it might be examined months later when a subsequent edition of the Pharmacopœia had become official; that injustice might thus be done to the shipper, and that therefore the act was unconstitutional. The court declared, on the contrary, that the phrase "official at the time of investigation" must be held to mean official "at the time the goods are shipped," regardless of when the actual analyses might be made. In other words, a manufacturer or shipper could not be punished for violating standards imposed *after* the act of sale or shipment had been performed, and he must be judged by the U. S. P. or N. F. in force at the time.

* * *

COCA-COLA AND ANTIKAMNIA.

Two or three other cases recently brought by the government are of considerable interest. The Coca-Cola case has been won by the defendants after a remarkable trial in the United States District Court of Tennessee. The judge refused to consider caffeine an injurious drug. He likewise refused to believe that the name "Coca-Cola" was in anywise misleading, holding that this title had from long custom become a distinctive name, and that the public knew exactly what it was buying. Experts for the government sought to prove many things against the product, and the government attorneys, failing in the district court, have carried the case to the Court of Appeals in Cincinnati.

In the meantime the Antikamnia case has been argued before the Court of Appeals of the District of Columbia. The nub of the contention here is:

Shall it be necessary for the manufacturer who prints the content of acetphenetidine or any other substance on the label of his product, to state the fact that this chemical is a derivative of acetanilide, or whatever one of the other six or seven substances mentioned in the food and drugs act may be involved? The Antikamnia people won the case in the lower court, and the present argument is made on the appeal.

* * *

LEGISLATIVE TROUBLES.

The legislative situation in Pennsylvania seems to be very complex and interesting these days.

The Fahey bill, providing for the publication of the formula on the label of all proprietary medicines, has stirred up quite a furore. The Philadelphia Association of Retail Druggists, after a meeting lasting two or three hours, finally voted by a large majority to oppose the bill. Later on, at a legislative hearing, Secretary Potts of the N. A. R. D. came from Chicago to argue against the measure; several others also opposed it; and it looks at this writing as if the bill would be put to sleep.

In the meantime almost as deep interest has been exhibited in the pharmacy measure. In one sense this is a blanket bill which represents a codification of existing pharmacy and anti-narcotic laws, but it also contains several new features over which there have developed marked differences of opinion. The State association last year voted to have the measure prohibit medical dispensing, but the framers of the draft afterwards left this provision out on the ground that legal counsel had advised them of its unconstitutionality. This has made the country druggists indignant, and for this and one or two other reasons they and their representatives in the legislature are now hostile toward the measure. The Philadelphia druggists were also at odds with one another over different features, but it is said that they have now gotten together.

Either in this pharmacy bill or in another measure in Pennsylvania, there is a provision limiting the work-day of registered clerks to ten hours, and that of qualified assistants and apprentices to twelve hours. Similar bills have been introduced in two or three other States, and with respect to one of these measures in Connecticut we have received a letter of protest which we are giving space elsewhere in the present issue of the BULLETIN. Evidently the clerks are fathering these bills, and it would seem that they are pushing them with a good deal of vigor.

THE OLDBERG CELEBRATION.

One of the delightful features of the month's history was the celebration in Chicago of the 25th anniversary of the School of Pharmacy of Northwestern University. Prof. Oscar Oldberg, the guest of honor, has retired from the deanship which he has held during the entire period of the School's history, and the occasion was really turned into a fine and beautiful tribute to him and to his services in behalf of pharmacy. President Harris of the University was toastmaster at the banquet, and greetings were brought from the deans of several other schools in the university group. The class of 1911 presented Dr. Oldberg with a handsome leather-bound address; the Faculty and some of the Alumni gave him a loving cup; and there was also given to the University a well executed bas-relief of the Doctor, modeled at the expense and through the initiative of the Alumni. The exercises were concluded by remarks from John Uri Lloyd and Harry B. Mason. Elsewhere in this issue we are reproducing one of the autograph portraits of Dr. Oldberg which were presented to his friends; we are also printing the address which he delivered at the anniversary banquet; and in an editorial we are endeavoring to pay tribute to the man and to the very important services which he has rendered in behalf of American pharmacy.

* * *

THE PHILADELPHIA COLLEGE.

The Philadelphia College of Pharmacy was brought to the front a couple of times last month. At a large and enthusiastic banquet held at the Union League Club, and presided over by Professor Remington, a portrait of President Howard B. French was presented to the college by the Alumni. The presentation speech was made by George M. Beringer with the latter's customary dignity and felicity. Mr. French violated his physician's orders to be in attendance, and he made a few remarks of appreciation at the close of the exercises. Meanwhile the newspapers have announced that the college would soon be moved to a position along the famous Parkway now being built from the City Hall to Fairmount Park, and that an alumnus of the college had promised to contribute one million dollars toward the erection and equipment of the new buildings. This English alumnus can apparently be none other than Henry S. Wellcome, but a cable from Mr. Wellcome's firm in London indicates that the rumor is unfounded.

AS TO PHYSICIANS' PRESCRIPTIONS.

This punishment of physicians for violating the Pennsylvania cocaine law reminds us that in Michigan it has been found almost impossible to punish physicians for a similar violation of the liquor local-option laws. Recently, for instance, a druggist has been convicted for selling a mixture of whisky and quinine even though he dispensed it in good faith upon the prescription of a physician. The physician went scot-free and the druggist was soaked! It is to avoid this sort of injustice that the Michigan Retail Druggists' Association has been endeavoring to have the liquor law so changed that in dry counties a purchaser's affidavit would be substituted for a physician's prescription. Out in Wisconsin a bill has been introduced in the State legislature restricting the sale of liquor by druggists to physicians' prescriptions, but the druggists are fighting it with tooth and nail. They have two or three of their own men in the State senate who are looking after their interests in the matter.

* * *

AFTER THE NARCOTIC MERCHANTS.

Many sentences have been imposed in the cocaine crusade carried on in Pittsburg by the Pennsylvania Board of Pharmacy. For the most part the culprits have been street peddlers of the drug, and in these cases jail and workhouse sentences have been the result. In other instances druggists were caught selling proprietary and other articles containing cocaine, and their defense was that they thought they had a legal right to furnish these products so long as, under the food and drug laws, the content of narcotic was stated on the label. This ignorance of the law was not accepted as a valid defense, but in such instances the court imposed fines and costs instead of jail sentences. Among those arrested but not yet tried are several physicians charged with writing prescriptions for habitual users of cocaine.

* * *

HYNSONIAN HARMONY.

The pharmacists and physicians of Detroit held their annual get-together meeting last month in the building of the Wayne County Medical Society. Henry P. Hynson of Baltimore was the invited guest of the pharmaceutical element, and he delivered the chief address of the occasion. It was received with very decided marks of approval by both pharmacists and physicians, and it was followed by an interesting and fruitful discussion.

Prior to the meeting a dinner was given Mr. Hynson by a few friends at the Hotel Cadillac, and toasts were responded to by Joseph Helfman, Prof. A. B. Stevens, Dr. Angus McLean, F. E. Bogart, and Mr. Hynson himself.

* * *

FIRE PROTECTION.

It is perfectly astonishing what chances merchants will take in going without adequate insurance. Not long since a western druggist who had built up a large business lost his complete stock and building by fire. The investment was fully \$75,000, but the amount of insurance carried was only \$10,000. If this unwise pharmacist collects every cent from debtors, with the \$10,000 insurance added, he cannot begin to pay his creditors. More than that, the labor and the accumulation of 25 years have been swept away in three hours—all because foresight was lacking to secure adequate fire protection. This druggist should easily have had from \$40,000 to \$50,000 of insurance.

* * *

VENEREAL ADVERTISING.

A new type of bill has made its appearance in several State legislatures during the last few years. It is a measure which prohibits the publication of advertisements in the lay press of remedies for venereal diseases, or even the advertisements of physicians or others who offer to treat these diseases. We believe a measure of this sort became law in one or two States last year, while others have been introduced this year in the legislatures of Ohio, Michigan and two or three other States. Certainly this type of bill is in the interest of the public health.

* * *

Treasurer Whelpley of the A. Ph. A. reported early last month that the Hallberg fund already totaled \$2230.29. Contributions made since that time have doubtless brought up the figure considerably, so that the final goal of \$3500 cannot be far away. Those desiring to contribute to this very laudable cause should correspond with Dr. H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

* * *

Wilhelm Bodemann has been elected to succeed the late Professor Hallberg as chairman of the U. S. P. Sub-committee on Miscellaneous Galenicals. The official number of this committee is 13, but a little thing like that won't bother Wilhelm any!

EDITORIAL.**HONOR TO WHOM HONOR IS RICHLY DUE—
PROFESSOR OSCAR OLDBERG.**

In Chicago last month there was fittingly celebrated the twenty-fifth anniversary of the School of Pharmacy of Northwestern University. Pharmacists and alumni from several States bore testimony to the importance of the occasion by their presence, and the banquet was impressive to a degree. But while the nominal purpose was to rejoice over the history of the School, it was in effect to pay honor and tribute to the man who founded the institution, who has for a quarter of a century presided over its destinies, and who has now reached the age when he feels compelled to retire from active service and turn his authority over to younger men.

It was eminently fitting that the services of Professor Oldberg to American Pharmacy in general, and to the Northwestern School in particular, should be made the subject of public acknowledgment and recognition. Few men in the profession have had his capacity for original and constructive thinking. Few have shown themselves his equal as a leader in educational thought and progress. Few have dedicated their gifts so generously, and with such absolute neglect of personal and selfish interests, to the welfare and redemption of their calling.

For considerably more than a quarter of a century Professor Oldberg has played a unique and important rôle in pharmacy. We can best describe it, at least to our own satisfaction, by saying that he has been a sort of philosopher on the mountain top—a seer who has had a calm, detached, broad view of the scene below him on all sides, who has observed and studied and pondered over the shifting panorama, who has realized what was missing here and there to complete the picture, who has more than once seen danger looming up and given warning of its approach, and who has with something of the old testament prophet in him pierced the future, foretold what would happen, and sought with forceful voice and eloquent pen to have wise and abundant preparation made for the inevitable.

Over-practical minds have held Professor Oldberg to be too much of an idealist. Perhaps, indeed, he has followed Emerson's advice and hitched his wagon to a star. But is there no place in

practical, democratic, money-loving America for fine and lofty ideals? Is there no need of men who shall inspire us onward and upward by holding high the standard and urging us eloquently to reach it? Here and there throughout the country one meets a student or follower of the professor who is faithfully carrying his ideas into effect, conducting a pure prescription pharmacy, and filling the rôle of "common chemist to the common people." Others, less fortunately situated, are coming as near to the goal as possible, and making themselves as much professional and scientific men as the circumstances will permit. And when you see these disciples you invariably find men who hold Professor Oldberg in such deep respect and veneration that their worship of him amounts almost to idolatry.

Ideas often outlive the men who conceive and give them utterance. If they are born of truth and rooted in human need, they go on growing in strength and force, and they are finally accepted by a public which has lost sight of their origin. It is yet far too early to measure the full results of Professor Oldberg's work as a leader, but already many of the reforms first agitated by him, and since taken up by others, are gradually being realized. For years he has been declaring with great force and vigor that the boards of pharmacy themselves have the power and authority to raise educational standards if only they would exercise it, and now we find many of them insisting upon a certain measure of preliminary education, denying "experience" credit to the colleges which do not live up to certain standards, and establishing requirements of one kind and another. He has always insisted, too, that the laws must provide for "assistant pharmacists" as well as fully registered pharmacists; that the requirements for one class must be much less severe than for the other; that the number of clerks would thus be incidentally increased while the number of stores would be decreased—and we find now that this idea has been quite generally accepted and that it is gaining force year by year. Back in 1906, and even before that, he declared that the boards and the colleges were all traveling their own paths; that the condition was one of confusion worse confounded; that agreement should be reached on a syllabus of subjects to which they could all conform—and now we have the syllabus movement well established, growing in favor, and promising much for the educational future of the calling.

We have not the space to take up in detail the

many educational, registrational, and legislative reforms which Professor Oldberg has urged with singular logic, power, and patience all these years. In epitome some of them may be found in the 13 principles prepared for discussion at the Indianapolis meeting of the A. Ph. A. in 1906, and it is our conviction that these principles, and the Professor's address that year as chairman of the Section on Education and Legislation, were models of clear thinking, constructive planning, and convincing English. Already Professor Oldberg as a prophet is not without much honor in his own country, but we venture the opinion that he will come into his own more and more as the years go by.

And what a fine, lofty character this is to which we are giving honor and shall continue to give honor! Never has there been the slightest stain on it! Never the least deviation from the path of quiet, simple honesty and dignity! He has never known what it was to practice the arts, even the accepted arts, of the shrewd politician; he has never sought to develop a "following," and indeed would not know how to go about it; he has never endeavored by "manipulation" to realize his legislative or associational purposes; his ideas have gained currency only by the sheer force of their own weight and importance.

His native honesty is shown in his own school, where he has carried into effect his ideals with such courage that it is an open secret that the institution has been an efficient educational agency at the expense of financial profit.

Loving his friends as few men do, blessed with the rare gift of humor, reveling in musical capacities of a high order, writing English like a master, measuring up to his ideals courageously but without posing or straining, living the simple, the natural, the rich life—let us wish him in his coming retirement many more years of fruitful, happy, contented effort! We of the BULLETIN OF PHARMACY especially wish him joy, for he was for three years, from 1895 to 1898, the editor-in-chief of this journal, and his high standards and lofty character are a precious heritage for which we feel profoundly grateful.

NARROWING PROFITS IN THE JOBBING TRADE.

There are many evidences that competition in both the retail and the jobbing branches of the drug trade is growing more severe little by little. The retailer scarcely needs to have this fact pointed out

to him—he knows it well enough. But perhaps he hasn't observed very closely the trend of things in the wholesale trade.

W. A. Hover, of Denver, Colorado, chairman of the Committee on Credits and Collections of the N. W. D. A., and one of the thinking men in the jobbing line, has recently compiled some statistics which are most interesting and significant in nature. Mr. Hover finds, for instance, that the cost of doing business in the jobbing drug trade has gradually increased from 9 per cent in 1878 to 12.85 per cent in 1909. Partially in explanation of this increase, he finds also that the percentage of sales *solicited by travelers* increased from 53.16 in 1899 to 64.5 in 1909. Thus within the short space of ten years the percentage of what might be called voluntary business—that is, business secured without the hard work of the traveling salesmen—decreased over 10 per cent. Rather a striking evidence of growing competition!

It is well known, of course, that proprietary articles afford little profit either to the retailer or the wholesaler. They are invariably sold at a pretty close margin, and it is perfectly clear that if a large portion of the dealer's business is made up of these articles he is bound to find it difficult to make very much money. Note, then, the significant fact that whereas the jobber in 1878 found 36 per cent of his business to be in patent medicines, he discovered this percentage to be 53.7 in 1909. In other words, more than half of the wholesale druggist's volume of trade is now made up of a line of goods in which the margin of profit is very close.

Scarcely surprising, is it, that under these circumstances the wholesale druggists of the United States are exhibiting a tendency toward consolidation? Within the last few years there have been several instances where two and sometimes three houses have combined their fortunes, with the result that much duplication has been avoided, the number of traveling salesmen has been reduced, and expenses have been cut down in many directions. We are bound to see more of this sort of thing in the years to come, particularly if the coöperative buying club movement continues to grow among the retailers.

As for the retailers themselves, while competition is gradually growing greater, we have often declared our conviction that the situation affords no cause for worry. Competition in a democratic and progressive country like America must always, and will always, grow in severity. The only thing for the

energetic man to do is to keep up with the procession. The retail druggist, like the business man in every other line, must advance with the times. He must do business on a more scientific scale; he must study modern methods; he must watch his competitors and go them one better. We do not think the live druggist has anything to fear from the department stores, the itinerant venders, the chain-store groups, or any other form of present-day competition. His problem is the problem of every other business man in America—to keep up with the times!

WHY MEN FAIL IN BUSINESS.

With a summary of the failures for 1910, *Bradstreet's* has presented its annual article in which the causes of failures are analyzed. Its investigations as to causes have been continued for a period of years. They show now as formerly that "tendencies present within the individual himself are largely responsible for four-fifths of all business failures," the remaining one-fifth being due to "extraneous conditions over which he has little, if any, control."

The researches of *Bradstreet's* have shown that the "faults within themselves" which cause men to fail are eight in number, as follows: Incompetence (irrespective of other causes); inexperience (without other incompetence); lack of capital; unwise granting of credits; speculation (outside regular business); neglect of business (due to doubtful habits); personal extravagance; fraudulent disposition of property.

In 1910 the failures due to the above causes comprised 82 per cent of the total, *while only 18 per cent were due to causes beyond the control of those who failed*; in 1909 the percentages were 81 and 19; in 1908 they were 75.5 and 22.5; in 1907, 81.1 and 18.9; and in 1906, 79.7 and 22.3. Of the eight causes named, "lack of capital," in 1910 as in all previous years, was the chief, being responsible for 33.9 per cent of failures. Next came "incompetence," which caused 26.6 per cent. "Fraud" was responsible for 11.2 per cent; this is about the normal percentage of fraud for a series of years, and presents, says the writer, "a curious and interesting exhibit."

These facts, carefully collected by experts over a series of years, are very suggestive, and they have their application to the drug business as well as to other lines of merchandising. In the drug trade it

is so easy to obtain a little credit and open a store that "the lack of capital" is even more of a factor in the production of failures or meager and indifferent successes than it is in other businesses. Experience shows it to be exceedingly unwise to start in business without ample capital unless one has reason to be unusually confident of his ability, determination, and capacity for hard work and self-sacrifice.

THE HALL OF FAME.

A PHARMACEUTICAL SENATOR.

Peder Jensen, who has for many years been secretary of the Board of Pharmacy of the State of Washington, is now wearing the senatorial toga in the State legislature. When we asked Mr. Jensen some months ago if it was true that he was nursing senatorial ambitions, he replied in characteristic fashion: "In politics? Well, I should say so! A Democrat—thank God!"

Mr. Jensen is one of the unique characters in the

PEDER JENSEN.

drug trade of the country. His sense of humor is very pronounced and very individual. Those who attend the annual meetings of the A. Ph. A. recall that he was a delegate last spring in Richmond to the meeting of the National Association of Boards of Pharmacy. As for his work in the State senate,

he writes in reply to our inquiry that he "hopes to be able to serve not only my constituents, but also my pharmaceutical brethren as a faithful watchdog of their best interests."

PROFESSOR WULLING ABROAD.

Frederick J. Wulling, dean of the Pharmacy Department of the University of Minnesota, has been sent to Europe by the University Board of Regents to get ideas for use in the construction of a new building which the U. of M. contemplates erecting in the fall. The Professor's health has not been particularly good of late, and he has wel-

PROF. F. J. WULLING.

comed the trip as a pleasant change. Because of his absence, and particularly because the establishment of the new *Journal of the A. Ph. A.* is now in an acute condition, Professor Wulling has withdrawn from the chairmanship of the A. Ph. A. Committee on Publication. Joseph W. England, who has made a close study of the proposed journal, has been elected by the Council to succeed him.

A PUBLIC-SPIRITED PHARMACIST.

During the last few months, since we began investigating the extent to which pharmacists here and there devote themselves to the public interest, we have been surprised to find how many of them have discharged their obligations as citizens and have been chosen to fill public office of one kind and

another. To the many instances mentioned in the BULLETIN of late we might add that of E. F. Heffner of Lock Haven, Pa. Mr. Heffner is well known to the druggists of Pennsylvania by virtue of the fact that he has now been serving for several

EDGAR F. HEFFNER, LOCK HAVEN, PA.

years as secretary of the State Pharmaceutical Association. It was only in 1896 that he was graduated from the Philadelphia College of Pharmacy, and at that time he took honors in materia medica and botany.

Mr. Heffner is a thorough believer in the principle that pharmacists ought to take prominent and leading parts in civic affairs, and in carrying out this

Mr. Heffner's residence.

philosophy in his own case he has had some very strenuous and exciting experiences. That his work has been appreciated, however, may be realized when we report that he has at various times been president of the Clinton County Taxpayers' League,

president of the Lock Haven Business Men's Association, and treasurer of the Y. M. C. A. He is at the present time secretary of the local Board of Trade, treasurer of the Clinton County Retail Druggists' Association, and junior warden and treasurer of St. Paul's Episcopal Church. After filling these various positions, and standing up generally for positive and aggressive methods, he expresses the opinion that to take a radical position in civic life openly and fearlessly never hurts any retailer provided he is sincere.

This must be true, because Mr. Heffner's business is generally understood to be one of the largest and most successful in his section of the State.

THE EXPANSION OF COOBAN.

The readers of this journal are particularly interested in B. S. Cooban of Chicago. For many years he contributed to the *BULLETIN* a series of live articles on different "own-make" specialties, and then he conducted for us a regular department

B. S. COOBAN.

of questions and answers on this subject. More recently we have failed to hear from Mr. Cooban except at irregular intervals, and at last we think we have discovered the reason.

This ambitious Chicagoan seems to be branching out in a surprising number of directions. We have just learned, for instance, that he has become a director in three Chicago institutions of importance—the National Theater on Halsted Street, the Chicago City Bank on Engelwood Avenue, and the Concordia Building and Loan Association. The

first two of these three institutions are shown in the accompanying engravings, and it will be seen at a glance that both are quite imposing structures.

All this while, however, Cooban is continuing to

The Chicago City Bank, of which Mr. Cooban is a director.

Mr. Cooban is a director also in the National Theater.

study the problems of his own business with the same tireless energy and aggressiveness, and every year sees an increase in the volume of sales.

THE PHARMACEUTICAL INQUISITORS.

We are presenting this year from month to month the portraits of certain interesting groups of individuals in the pharmaceutical community. Last month, for instance, we introduced to our readers the pharmaceutical editors of the country. This month we are exhibiting the members of some of the American boards of pharmacy.

Turn over the next page and you will find 18 of these men—18 of the inquisitors before whom candidates for registration must pass before they can get their coveted papers. They all look kindly, but what a severe exam. they do put up occasionally! It is sometimes pretty hard to get by them, as many an applicant has found to his chagrin!

Charles B. Whilden, San Francisco,
California Board.

Addison Dimmitt, Louisville,
Kentucky Board.

S. L. Bresler, Denver, secretary
Colorado Board.

Edward Williams, Madison, secretary
Wisconsin Board.

Dr. J. B. Bond, Sr., Little Rock, president
Arkansas Board.

Edward P. Galt, Selma, secretary
Alabama Board.

M. W. Friedenborg, Winfield, president
Kansas Board.

E. T. Off, Pasadena,
California Board.

C. D. Jordan, Monticello,
Georgia Board.

Members of some of the American Boards of Pharmacy.

Ernest Berger, Tampa, president
Florida Board.

John A. Levery, Bridgeport, secretary
Connecticut Board.

A. F. Sala, Winchester, president
Indiana Board.

F. W. Bucknam, Skowhegan, secretary
Maine Board.

G. V. Kradwell, Racine,
Wisconsin Board.

Jerome J. Keene, Indianapolis,
Indiana Board.

Theo. E. Otto, Columbus,
Indiana Board.

E. F. Klein, Hot Springs,
Arkansas Board.

W. H. Fogas, Mt. Vernon,
Indiana Board.

Members of some of the American Boards of Pharmacy.

Thomas Voegeli, ex-president of the N. A. R. D., corner of Logan and Douglas Streets, Minneapolis.

Frank W. Bucknam, secretary of the Maine Board of Pharmacy, Skowhegan, Me.

A. H. Webber, ex-president of the Michigan Board of Pharmacy, Cadillac, Mich.

George B. Kauffman, dean of the College of Pharmacy of Ohio State University, Columbus, Ohio.

P. Henry Utech, the familiar writer on practical pharmaceutical subjects, Meadville, Pa.

Charles L. Hay, ex-president of the Pennsylvania Pharmaceutical Association, Dubois, Pa.

Homes of well-known druggists.

Willis G. Gregory, dean of the Buffalo College of Pharmacy, 344 Richmond Avenue, Buffalo, N. Y.

B. S. Cooban, well known by his contributions to the BULLETIN OF PHARMACY, 518 West 62d Street, Chicago.

Edward L. Baldwin is the owner and occupant of this exceedingly unique residence at the corner of Wollen and Buena Vista Avenues, San Francisco, Cal.

Henry D. Huggan, whose beautiful pharmacy was written up in the BULLETIN two or three years ago, built this residence for himself in Boston.

Homes of well-known druggists.

Special Soda Section.

We have secured for this issue of the BULLETIN some of the most practical and valuable articles on the soda business that we could get—articles written in every case by successful soda dispensers themselves. Every contribution was especially prepared for this journal and has never appeared before. There are four or five short papers describing “Best Soda Schemes” which have been devised and successfully carried out for the development of trade. There are three or four articles in which experienced and well-known dispensers give a valuable collection of useful hints in the making and serving of drinks. And most important of all, perhaps, are a collection of formulas which have been awarded prizes in our recent contest—formulas which, unlike many that appear and reappear in the drug and soda journals, can be depended upon for their originality and excellence.—THE EDITORS.

PRIZE-WINNING SODA FORMULAS.

Recently the BULLETIN OF PHARMACY conducted a prize contest offering ten, five and five dollars respectively for three best soda formulas. The winners have been selected by a special committee of expert dispensers, and appear in this article. Since several of the formulas submitted deserve honorable mention, we are printing them along with the winners:

FIRST PRIZE FORMULA.

By L. W. HARTZ.

CHOCOLATE SOLDIER.

For a fancy, nice looking sundae, one that is suited to a fountain catering to the better class of trade, this is just the thing:

- 1 dipper of chocolate ice cream.
- 3½ lady fingers.
- 1 chocolate Teddy bear.
- 1 small American flag.

It sells for 20 cents, although some stores might charge a quarter. Teddy bears are made by the National Candy Company and can be obtained in any city at 60 cents a box of 1000.

SECOND PRIZE FORMULA.

By R. J. JENKINS.

DELICIOUS FROZEN SHERBET.

This frozen sherbet is literally a frozen phosphate, a delicious thing at the fountain. When first made, it has only a tart taste, the flavoring agent being added when the ice is served, thus allowing the dispenser to prepare any kind of a sherbet desired by using this base. I make five gallons at a time after the following formula:

Make a frozen ice exactly like lemon ice, but use only 1 ounce of citric acid in place of lemon juice, or enough to make the batch very tart.

To serve take a 7-ounce phosphate glass, put in 5 ounces of frozen phosphate, 1½ ounces of the desired crushed fruit, and mix well with a spoon. Serve with a cherry on top.

THIRD PRIZE FORMULA.

By P. I. MINTON, PLAINFIELD, N. J.

“POMPONA” ICE-CREAM SODA AND SUNDAE.

These are my best soda specialties. I first make the Pompona syrup as follows:

- Tincture of vanilla (pure).....2 ounces.
- Orange-flower water (best).....4 ounces.
- Chlorophyll (green coloring).....2 drachms.
- Syrup, enough to make.....1 gallon.

This makes a transparent, bright green syrup. For ice cream soda use:

- Pompona syrup2 ounces.
- Ice cream2 scoops.

Run in carbonated water to fill the glass and top off with a small amount of whipped cream.

POMPONA SUNDAE.

Put the usual amount of ice cream in a sundae glass, pour on Pompona syrup, add a little whipped cream, and top off with a cherry.

These two dainty soda specialties are entirely new and original with me, and many a customer has wondered what the peculiar flavor (of the combined orange-flower water and vanilla) was. It has made a great hit in our city. “Pompona” seems

to be the by-word. The word "Pompona" is a botanical term given to certain species of the vanilla bean tree. The name is catchy, odd, and new, having never been published before.

FORMULAS RECEIVING HONORABLE MENTION.

In addition to the three prize winners, the committee thought the following formulas were deserving of honorable mention:

"OUR SPECIAL."

(Sydney Trau, Cleveland, Ohio.)

Take a small mold (about 3 x 2 x 1 inches), put into it in opposite corners two red and two green cherries, and in the center set a round slice of pineapple. In the center of the pineapple put a decoration, filling the mold with cream of any desired flavor. Place two Nabisco wafers on a china platter, and empty the contents of the mold on the wafers. Then top off with whipped cream and English walnuts, the latter on top of the cream.

An easy way to keep the cream from sticking to the mold, and also to assist in the removal of the cream, is to wet the mold, then cut the sides with a knife and turn over. I use strawberry and vanilla cream unless specified.

I sell this for 15 cents.

CUBANOLA SUNDAE.

(L. W. Hartz.)

This is something new.

Slice an orange after peeling it. Cut a slice in half and place a half on each side of the plate. Set a cone of ice cream in the center, filbert nuts on one side, walnuts on the other, a green cherry on one half of the orange, a red cherry on other half. Sell for 15 cents.

MAJESTIC SUNDAE.

(L. W. Hartz.)

Use a parfait glass.

Cherry crushed fruit.....1 ounce.

Chocolate ice cream.....1 dipper.

Banana, sliced½

Vanilla ice cream or pineapple ice. Walnut meats on top. One red and one green cherry.

Sell for 15 cents.

HONEYMOON PANSY.

(R. E. Black, with the Beach Drug Co., Beach, N. D.)

This formula has made the greatest hit of anything in the soda line that I have struck.

Select a nice, solid cantaloupe and scrape the out-

side so that it looks neat and fresh. Then cut it into four pieces the shape of a new moon. Place these on a long platter, preferably a banana dish, then take a spoon and cut a notch on the points and lay a red cherry on each point.

Put a small dipper of ice cream in the center and pour a little thick chocolate syrup over it. Then cut a slice of pineapple—the kind that comes in little cans is easy to cut in the shape of a half moon, and place it on the top of the ice cream. Top with a little whipped cream and a cherry, then place a fresh pansy blossom on the dish and call it the "Honeymoon Pansy."

And as soon as you get it started everybody will be wearing the Honeymoon Pansy. I get 25 cents for this and nobody kicks.

BRAIN FAG DRINK.

(L. W. Hartz.)

Coca cola1 ounce.

One dash of lemon (fresh).

Fill the glass with carbonated water.

Sell for 5 cents.

CHOC-NUT SUNDAE.

(L. W. Hartz.)

This sundae has a bitter-sweet taste.

Vanilla ice cream.....1 dipper.

Chocolate syrup.

Grate bitter chocolate on top.

1 red cherry.

Sell for 10 cents.

GRAPE FLOAT.

(C. K. Bushey, Dillsburg, Pa.)

Fill a twelve-ounce glass to within an inch of the top with plain lemonade. Then carefully float on the top a sufficient quantity of grape juice to fill the glass, being careful not to disturb the lemonade, which will spoil the appearance.

A good, long drink and a thirst quencher is the result.

TWIN SUNDAE.

(L. W. Hartz.)

Use a bone-dish.

One slice of pineapple, halved.

Place a dipper of chocolate ice cream on one end and one dipper orange ice on other end.

Set a red cherry on chocolate ice cream and a green cherry on orange ice.

Place filbert nutmeats in the center or sliced pineapple.

Pour heavy maple syrup on each side of the pineapple.

Sell for 15 cents.

BOTTLED GINGER ALE.

(R. J. Jenkins.)

The following formula yields a delicious ginger ale that may be served either in bottles or in a glass:

Distilled water.....	4 gallons.
Granulated sugar.....	32 pounds.
Caramel coloring.....	4 ounces.
Vernor's ginger ale extract.....	16 ounces.
Solution citric acid.....	6 ounces.

CARAMEL SYRUP.

(R. J. Jenkins.)

Very few druggists know how to make a good caramel syrup. The most common mistake in making this flavoring agent is to use cream. I do not use cream. It sours too rapidly. I prefer Eagle brand condensed milk, which should be added after the batch is cooled. Otherwise it curdles. I use this formula:

Granulated sugar.....	12 pounds.
Boiling water.....	1 gallon.
Eagle brand condensed milk.....	1 can.

Burn the sugar until it is fully melted and of a rich, dark brown color. Remove it from the fire and add slowly 1 gallon of boiling water and boil until the sugar is entirely dissolved. Let it cool and add the condensed milk.

CHOCOLATE CREAM SUNDAE.

(S. C. Elwyn, Cartersville, Mo.)

Over a cone-shaped dish of ice cream that stands up well pour a small amount of chocolate. Round the edges, place three or four whole cherries and sprinkle a small amount of shredded cocoanut over the cone. Lastly set a piece of chocolate cream candy which has been pulled apart into halves on top of the cone.

This makes an attractive sundae and is also an advertisement for the candy department.

LEMON FLAVOR.

(Fred O. Mason, Litchfield, Conn.)

Here is a good formula for a lemon flavor:

Lemons (large)	12.
Oil of lemon.....	100 minims.
Sugar	18 pounds.
Water	12 pints.

To the grated peel add the sugar and oil. Pour in 1 quart of water and the juice of all the lemons. Triturate well and strain. Repeat, adding 3 pounds sugar and 1 quart water, until the sugar is exhausted.

TWIN CITY SPECIAL.

(D. L. Lucey, Chehalis, Wash.)

Take a 4-ounce wineglass, the inside of which has been wet, and scoop up vanilla and then straw-

berry ice creams. Then hold it upside down over a fancy sundae cup. Give the glass a quick twirl and the cream will drop out. Surround the base with maple syrup. Place three pineapple cubes on two opposite sides and one walnut half and one pecan half on the two remaining sides. Decorate with whipped cream and cherry and sprinkle powdered cocoa over the whole.

FRUIT SPECIAL.

(Oliver Rasico, Vincennes, Indiana.)

The following fruit mixture is a topping for sundaes. We use it on "Our Fruit Special," which has been a good seller.

Crushed strawberries.....	3 pints.
Crushed pineapple	½ pint.
Bananas chopped fine.....	No. 6.
Simple syrup, sufficient to bring mixture to the right consistency for dispensing.	

HURRY-UP CHOCOLATE SYRUP.

(D. L. Lucey, Chehalis, Wash.)

Extract the strength of nine ounces of cocoa with boiling water. Beat up the whites of six eggs and beat in the cocoa and water. Add boiling water and sugar to make two gallons. This can be made in ten minutes.

COLONEL JOCK.

(D. A. Frick, Audubon, Iowa.)

This has been a winner with us as a hot drink and equally good iced:

Grape juice.....	2 ounces.
Raspberry syrup.....	1½ ounces.
Ginger syrup.....	½ ounce.
Boiling water to fill a 12-ounce glass.	

"Colonel Jock" brings us 10 cents.

MINT FREEZE.

(D. A. Frick, Audubon, Iowa.)

Cracked ice, a small quantity.
Fresh mint, a few leaves cut up.

Express juice by pressing the leaves with a spoon against the side of the glass.

Juice of half a lemon.	
Juice of half an orange.	
Pineapple syrup.....	1½ ounces.
Grape juice.....	1½ ounces.

Run in carbonated water in a coarse stream to fill a 12-ounce glass.

Add each ingredient carefully without stirring, allowing the liquids to lie in layers.

Fruit with a slice of orange, a cube of pineapple, a maraschino cherry, and sprig of mint.

This is 20 cents a drink.

SERVING SODA BEVERAGES.

BY JAMES WHELAN,

Chief Soda Dispenser for the Gray & Worcester Stores, Detroit, Mich.

When mixing an egg drink or fancy drink of any kind to which soda is to be added, never let it stand on the counter a moment. After mixing completely, pour the beverage into the service glass at once, as a mixed drink of any kind that contains soda gets flat quickly. Serve the customer as soon as possible.

SOME HINTS.

Large soda apparatus should have a carbonator. If the carbonator sets from 60 to 100 feet away from where the soda is drawn, the gas should be kept under a pressure of 150 pounds. If the carbonator is less than 60 feet away, the pressure should be at least 120 pounds.

I advise one about to buy a carbonator to be careful in selecting it. Buy one as simple as possible. Also one which has an agitator which will mix the gas and soda thoroughly.

A word to the wise soda man buying gas: be careful to procure mineral gas; it is much stronger and drier than vegetable or beer gas.

To detect beer gas that contains vapor, let some of it strike a paper or the hand. The moisture is readily apparent. You will often detect beer gas, too, by an odor which mineral gas never contains. Mineral gas is dry and gives a very bright sparkle to soda water, and is, therefore, preferable.

As to cleanliness about soda apparatus, everything from top to bottom should be scrupulously clean. By having a system about your apparatus this should be a very easy problem.

Have fresh fruits on your soda fountain as early as possible, so that if you do not have them you know the other fellow is also unable to procure them.

Always try and have something your competitor does not serve. By this I mean something new and original at all times, and if you are at all adapted to your business this will come very easily to you, especially if you try.

Aim to change the decorating of the soda apparatus or back fixtures just the same as you do your display windows or stands. Always try to attract your customer or trade to your soda fountain, as soda water is a luxury which your customers do not have to buy and which they must be tempted into buying.

A shining, bright apparatus is essential. Just as

a nicely set dinner table will stimulate an appetite, so will a well-kept soda fountain create a thirst.

Electric fans add much to a soda counter, but do not turn them so that the air current will strike the cream or soda coolers, as it will melt both. The air from the fan is much warmer than that in the cooler or freezing compartments.

BOSTON NUT SUNDAE.

Boston Nut Sundae has been a winner with us. We make it up from day to day and sell it for ten

The "Boston Nut" sundae.

cents. The formula, which I originated myself, is as follows:

Mixed cherry fruit.....	1 pint.
Crushed pineapple fruit.....	1 pint.
Crushed strawberry fruit.....	1 pint.
Whole cherries	1 pint.
Maple syrup	2 pints.
Crushed or chopped walnuts.	

Mix well.

Use two ounces of this mixture over vanilla ice cream.

GOLDEN SUNSET SUNDAE.

This is a very tempting and appetizing dainty.

One 16-to-a-quart scoop of orange ice.

One 16-to-a-quart scoop of chocolate ice cream or other fancy cream.

Serve on small individual plates. Pour 1½ ounces of

The "Golden Sunset" sundae.

golden orangeade syrup over the cream and top with two cherries. Sell for 15 cents.

HOT SODA.

As to closing up a centrally located fountain in the winter, that is a thing of the past. Hot drinks manipulated correctly sell as readily as cold drinks. I should advise to the beginner in serving hot soda to serve hot lemonade, hot chocolate, hot coffee and hot phosphates.

Serve two or three wafers, such as a saltine wafer, a Graham wafer, and a macaroon, with the foregoing. A very good hint would be to change your variety of wafers occasionally, giving your trade something different.

Let this be your motto: A pleased customer is a walking ad. A little newspaper advertising along with an observation of these hints should surely make you successful.

DON'TS FOR SODA MEN.

Don't wear untidy linen.

Don't come to work with your nails dirty.

Don't chew gum back of a soda counter.

Don't wipe your hands on your apron.

Don't juggle glasses or drinks even though you may be able to do it successfully, as being unsuccessful may cost your firm the price of a lady's gown or a gentleman's suit.

Don't try to get a glass so full of a mixed drink or ice cream that it is going to slop over on the floor or counter.

Don't trifle with gas drums, carbonators or charging outfits unless you absolutely understand them.

Don't stand and converse with a customer while others are waiting to be served.

Don't handle shaved ice with your hands. Use an ice scoop.

Don't try to give your customers, or I should say lady friends, 15 cents' worth for ten cents. Your firm pays your salary. You are working for the store, not for your friends, and if you continue giving away goods the boss will soon catch you at it. This caution applies more to large soda fountains where from five to ten soda dispensers are employed.

A PLEA FOR TEN-CENT ICE-CREAM SODAS.

BY HOWARD PHELPS,

Chief Soda Dispenser of Standard Drug Co., Detroit, Mich.

Every bright, up-to-date druggist considers the modern soda fountain an indispensable adjunct to his business, for even if he only "breaks even" on it, the number of new customers which it brings to his store makes the fountain a desirable advertising feature of his business.

The evolution of the modern soda fountain and ice-cream soda is a very interesting study, and can be traced from the old-fashioned goose-neck draught-arm and small counter arrangement of a few plain bottle syrups to the gorgeous marble, silver and onyx creations of the present day.

Ice-cream sodas, if history is correct, were first served at the Centennial Exposition in Philadelphia and seem to have immediately caught the popular fancy of the people; but it was not until the year 1885 that the soda fountain began to make its appearance in the drug stores of the country as a permanent fixture of the business.

The price charged for these early sodas remained the same as for their predecessor, the plain soda, and this price, five cents, seems to have clung closely and remained the same in nearly all sections of the country until the last few years.

If the present fountain owner will stop to consider, he will see no resemblance between these earlier ice-cream sodas and the ones served at the present day.

The Sundae, College Ice, Dip, or Dope, as it is called in different sections of the country, is responsible in a measure for this, as its advent caused the addition of crushed fruits to the fountain menu, and it was only another small step to begin the use of crushed fruits in the ice-cream sodas in place of the fruit syrups already employed. Here is where the fountain owner should have made a distinction between the plain syrup and crushed fruit sodas. A few did, but the average owner seemed satisfied to stick to the old price of five cents.

This might do all right for the volume of business carried on at that time, but now the proprietor of a fountain catering to two or three thousand customers has to consider it in the light of a very serious proposition. It is a well-known fact that the ice-cream sodas of to-day cost practically as much to serve as the sundaes, for which the owner has no trouble in getting 10 and in some places 15 and 20 cents. Why should the fear of loss of

patronage deter the druggist from making a new price on a product which is well worth that price? Give people a little more ice cream, a little more fruit if necessary, make the soda cost six or even seven cents, but get the price which the owners in all the larger cities have come to consider necessary to the profitable running of their business. It has seldom failed of success wherever tried, and while some customers may not see the justice of raising the price, it is to be remembered that it only takes half as many ten-cent purchases to make the same

showing in the cash register. Also remember that there are hundreds of visitors to the fountain each year who have already paid 10 cents for their sodas at some of the large city fountains, and these visitors *expect* to pay 10 cents at your fountain unless told differently by *you*.

Let us follow the example of the big fountain owners and create a new universal price for ice-cream soda which will be recognized by the American people as the standard price for all time. It ought to be done.

A SODA FOUNTAIN IN A SMALL VILLAGE.

BY LOU E. PHELPS, EAST SMITHFIELD, PA.

The advisability of installing a fountain in a small town may be a topic quite apropos for this department inasmuch as the experiences of the small druggist seldom seem to get into print, and it is with the hope that some one with the same problems that we had to face may be helped by our solution of them that this paper is written.

Our village consists of seventy-five or eighty families and is located in the center of a township largely composed of dairy farms with a population of fourteen or fifteen hundred. These people do not easily part with their money and one can almost hear the scream of the eagle as they reluctantly lay their cherished coin on the counter in exchange for their necessary drugs.

The store force consisting of father and daughter had often considered the subject of investing in a small fountain, but had feared that it would not pay expenses. Finally in spite of unfavorable conditions, we bought a second-hand outfit consisting of a 10-foot marble slab with two double counter draughts, a crude ice-box, charging outfit, a drum of gas, one 10-gallon fountain, a dozen each of soda and mineral glasses with holders, phosphate bottle, eight syrup bottles, half a dozen each of ice-cream and soda spoons, and six pints of concentrated syrups. For this outfit, installed ready for use, we paid \$150 cash. This was in August, 1901.

STARTING IN A SMALL WAY.

We began with the expectation of "sawing wood," and we have kept the saw sharp and warm ever since—our one competitor served as an incentive to keep it sharp, and our determination kept it warm!

At first we sold soda Tuesdays and Saturdays

only, making the cream ourselves as economically as practicable, and found that quite passable cream could be made at an expense of only 26 cents a gallon for material. At the end of the first entire season (1902) we found our receipts for the season to be \$59.98, with a net gain of \$45.44, counting out our own labor. This we felt was a fair beginning, as our time had to be given to the business anyway, and the following year we adopted the policy of a steady advance in quality of material and a constant endeavor to make our soda and our service the very best.

THE BUSINESS PROGRESSING.

Each year we have tried to add some new flavor, cutting out the ones least in demand and continually studying to improve our cream and methods of service.

We made an ice-box in lieu of a cabinet to fit our space under the counter, from half-inch packing-box lumber, consisting of two thicknesses with one inch of sawdust between and lined with galvanized iron. In this we kept our freezer with a small cake of ice beside it, repacking the freezer twice a day.

We have found it impracticable so far to try to do anything with 10-cent sodas, and find that the bulk of our trade is in 5-cent ice-cream sodas and 5-cent sundaes, of which we sell about an equal amount. But we are now working for more 10-cent sundaes, for which we already have quite a sale.

From the first we have refused absolutely to sell cream or soda on Sunday, and in this are supported by practically all our own people. Transients sometimes call for it but are refused, although we are always ready to sell sick-room supplies on that day. As a usual thing we have let the excellence

of our soda and courteous and neat service do our advertising for us, but one season after a futile attempt by a neighboring barber to capture our trade by making cream and dispensing an imitation soda from a beer-pump, we issued the following card, size $3\frac{1}{4} \times 5\frac{1}{2}$ inches, to our customers:

"THE NORTH POLE"

SPRING ANNOUNCEMENT

The Soda season will open the first week in May at Phelps' Fountain, where you will find the same high standard of quality and service that has been maintained in the past, with the added degree of excellence which is attained only by practice and a constant study of down-to-date drinks and methods of service.

Cheap drinks or drinks of unknown composition are dear at any price, and as we always satisfy ourselves of the perfect safety of our syrups in all respects, our patrons may unhesitatingly rely on their purity and excellence.

We hereby wish to thank you for your liberal patronage in the past and bespeak your co-operation during the coming season. Yours for the best Soda,

D. G. PHELPS.

LOU E. PHELPS.

We have also made free use of a blackboard, using what skill we could command to make it attractive, which idea our wise competitor imitated. It soon became apparent to the public as well as to ourselves that he was playing a losing game, and in a short time he left town.

Two years ago the proprietor passed to his reward, but the business has been continued with the

help of the mother, and a boy hired as occasion demands to do the heavy work.

A NEW FOUNTAIN INSTALLED.

Last season we installed a 10-syrup Lippincott wall fountain (rebuilt) for \$250. Our equipment has been otherwise improved from year to year by adding more freezers, a new steel fountain, and other things as the work has demanded, and we now find ourselves well prepared to handle the business.

Our receipts last year were \$307.25, having steadily increased each year, and in spite of having a larger percentage of expense than usual the net gain was \$158.96.

At present our flavors consist of chocolate, strawberry, pineapple, vanilla, lemon, and orange. We serve such beverages as lemon phosphate, grape juice, and Hires's root beer, with occasionally a "special."

Our chocolate syrup and our ice-cream have each received a large share of attention and both have rewarded us for our care. We have taken particular pains to make our cream a smooth, rich product from healthful materials, and our success has been such that we sell considerable by the quart and gallon and have the reputation of making the best cream in the community, our formula being kept strictly to ourselves. We feel that the end is not yet and are prepared to continue the good work.

DISTRIBUTING FREE SODA COUPONS.

BY STANLEY CAIRNS, FOREST, ONTARIO.

The most successful plan that we have used for exploiting our soda business was that of distributing free coupons. These coupons were plainly printed cards, supplied by our local printer and costing but a few cents a hundred. When presented at our fountain each one was worth five cents. At first we had the cards good only when buying a special soda of our own formulæ, but we changed it later as we found it paid better to make the coupons redeemable any time.

HOW THE COUPONS WERE DISTRIBUTED.

At the beginning of the busy season we sent our boy around with the coupons and saw to it that each one was placed in the hands of an adult in some family, and in this way created more interest. None were thrown in the doorway.

Now as to results: There was only one card in each family, and therefore only one member could

benefit by it. But do you suppose that one person was going to go and have his soda alone on a busy day? Not much. They stood treat to their friends, sometimes three or four of them, and more often than not they would purchase a 10-cent dish. Some merchants might object to this scheme on the ground that most people would not bother with a coupon only worth 5 cents and would either throw it away or give it to children. But the majority of housewives these days are not inclined to throw away anything of value or a bargain, even if it is only worth 5 cents. And even if they do give it to children, it is turned to gain. We use them as kindly as possible, they get in the habit of coming here, and their parents appreciate our courteous treatment of the youngsters.

We use this system several times a year and our business has increased wonderfully. We have yet to lose on it.

THE FOUNTAIN LOANED FOR CHARITY'S SAKE.

BY EDWARD MANN, SARNIA, ONTARIO.

I will attempt to describe how we helped boom our soda business after entering the field.

The women of a charitable society in town had asked for the loan of our window on certain afternoons for the sale of home-made baking and candy. It occurred to us that a good way to advertise our soda business would be to offer our fountain to the women and the window also. My boss did this, and the ladies were delighted with the offer. They accepted at once. Our offer also included the free use of flavoring syrups, soda water, etc., and one of us was to remain at the fountain and dispense for them. The only thing for which we did not foot the bill was the ice cream, and we offered to pay for that, but they refused. As some of the ladies had freezers, they decided to make their own cream.

The society advertised the sale well, both in the local papers and by posters, and our courtesy and name were prominently mentioned in every such case.

HOW THE SCHEME WORKED OUT.

When the Saturday came, the counters were filled to the limit all day. The women displayed their home-made cooking and candy in the window, and thus attracted passers-by. It was in this way that I found out that apple pie and ice cream was a splendid seller at 10 cents a dish. Now I always keep them on hand. As I said before, one of us remained at the fountain all day. But the ladies made able assistants and helped us clean up.

All the members of the society were delighted with the success of their day's work, and their effusive thanks were nearly reward enough for our trouble. But let me tell you we got more than thanks the rest of the summer. Although we lost the proceeds of the day's business, plus a great many other things, the sale was one of the finest advertisements that we ever had. Our soda patronage received a stimulus that day that no newspaper advertising would ever have given it. The ladies are still regular customers.

A PERCOLATOR FOR MAKING SIMPLE SYRUP.

BY HOWARD PHELPS, DETROIT, MICH.

The making of a good home-made percolator is a very simple matter and also inexpensive. Every owner of a fountain who does not feel like buying one of the many styles of syrup percolators now on the market will find this percolator entirely satisfactory. I have used it for the last four years and have never had a particle of trouble with it. This cannot be said of many of the percolators which are on sale at very fancy prices. The syrup if made properly will be very heavy, practically a saturated solution, and can be thinned down to suit the fancy of the dispenser.

1. Get a good alcohol or whisky barrel, one that has not been charred if possible.

2. Remove the head and saw a circular hole in it about 5 inches in diameter.

3. Fill the barrel with hot water and sal soda and let it stand over night. Then rinse it out thoroughly. This will tighten the hoops and sweeten up the barrel.

4. Bore a hole at the bottom side of the barrel

and put a syrup gate or faucet in. This gate can be purchased at any hardware store for about 40 cents and should be placed on a vertical line with the bunghole of the barrel.

5. Place the head back in the barrel and the syrup reservoir is ready.

A glass gauge can be placed in the side of barrel by bending a piece of water-gauge tubing and putting this in a cork to be inserted in the bunghole. This will register the amount of syrup in the barrel after it is half-full, and in the case of a large user of syrup is to be desired, as it is well to keep a half-barrel of syrup on hand during the summer months.

6. Secure a 20-gallon keg, one which has contained alcohol if possible. Remove the head and wash thoroughly.

This is the percolator proper and should be selected carefully. Now bore a hole exactly in the center of the bottom of the keg about one-half inch in diameter.

7. Measure the inside diameter of the keg, and have a tinsmith make a cone-shaped strainer to fit in the bottom of the keg. This strainer has a solid tin bottom with a small $\frac{3}{8}$ -inch spout about

3 inches long running from exact center of bottom as per illustration. The cone should be about 6 inches high at center and is made of heavy metal sieving found in any tinshop.

8. Tie a piece of cheese-cloth of double thickness

over the cone, using the spout on the under side of the strainer to tie the ends of the cloth to.

9. Place the strainer cone in the bottom of the keg with the metal tube protruding through hole in keg.

10. Fill the keg with granulated sugar to within 10 inches of top, and then add enough water to fill to top.

11. Place this on top of the big barrel or syrup reservoir and allow it to percolate.

12. The percolator cone should be cleaned about once a month and a new cheese-cloth placed over it. The sugar which is in the keg at the time of the cleaning can be dumped out in a receptacle and put back in the keg after the cheese-cloth is replaced.

In case the percolator is to be stopped for a time, fill it to the top with sugar and add enough water to moisten it thoroughly. This will keep the keg from drying out and leaking.

Never add water unless the keg is at least half-full of sugar, as the water may form a hole down through the sugar and run into the syrup reservoir without forming syrup. This water will float on the syrup in the reservoir and soon ferment enough to spoil the whole amount of syrup.

In case this should happen, draw off all the syrup in the reservoir and pass it back through the percolating keg immediately. This will mix the syrup and water and stop fermentation.

A FLAG CONTEST AT THE SODA COUNTER.

BY R. J. JENKINS,

Chief Soda Dispenser for the Central Drug Co., Detroit, Mich.

Let me describe a contest that is being carried on at our soda fountain with no little success. Suspended in plain view of our soda patrons is a sign:

Every Monday and Tuesday red stamps are given away by the soda clerks with every order. On Wednesday and Thursday white stamps are used, while on Friday, Saturday and Sunday blue stamps

are distributed. This completes an assortment of red, white and blue stamps.

At the end of thirty days, the woman who makes the largest flag out of stamps obtained at the fountain is given a complete toilet set. This is the first prize and consists of a brush, comb, nail file and polisher, scissors, and hand mirror, all contained in a pretty case. The woman who makes the second largest flag is given a complete manicure set about 6 by 12 inches containing a file, scissors, polisher, and similar accessories.

This scheme, of course, arouses a good deal of interest in the contest on the part of the soda patrons and brings business considerably beyond the cost of the prizes.

THE NEW HYNSON-WESTCOTT STORE.

The Well-known Firm of Prescription Pharmacists in Baltimore has Established a Handsome Branch to Extend its Business in the Realm of Legitimate Pharmacy—All Side-lines Eschewed and Prescriptions Made a Specialty.

It isn't necessary for us to say very much about the business in Baltimore of Hynson, Westcott & Co. Everybody knows by this time that these people have made a name for themselves in the line of truly professional pharmacy. Then, too, they were written up in this journal several years ago,* and

The building in which the new Linden branch of Hynson, Westcott & Co. has been installed. These attractive windows are used only for the exploitation of purely scientific or professional things.

since everybody in the drug world reads the BULLETIN—well, we are almost too modest to say that for this reason alone the druggists of the country certainly know all about Hynson, Westcott & Co.

Our object this month is merely to say that the firm has opened a new branch, and to reproduce two or three pictures showing views of this really unique establishment. The engravings speak for themselves for the most part, and it will not be necessary to add very much by way of explanation. As in the parent store, no side-lines of any sort or character will be carried. Not even cosmetics will be in stock. The fashionable woman who buys her

attractive complexion ready made will have to go elsewhere for flesh tints.

On the other hand, however, the new branch will have a full line of every drug, preparation, appliance, or necessity used in the treatment of disease. Such things as syringes, atomizers, douches, ice bags, night lamps, thermometers, dietetic products, sterilizers, pasteurizers, surgical dressings, and so on *ad infinitum*—these will be available in great variety and abundance. But of course the great specialty with Hynson, Westcott & Co. is after all their prescription business. This is the thing they pride themselves on, and they have worked it up to a very successful point.

The main store has always been located at the corner of Franklin and Charles Streets. The entire building of four stories and basement is employed, and in addition there is a separate warehouse which

The interior of the new branch shows the place to be very handsomely fitted up. The absence of the customary side-lines will be noted at once.

gives a combined floor space of over 4500 square feet, not counting the new branch. The latter is at the corner of Linden and North Avenues. This is a transfer point of considerable importance, and it taps a residence neighborhood of great possibilities. Intersecting car lines reach out to such suburban places as Walbrook, Forest Park, Park Heights Avenue, Arlington, and the like.

*BULLETIN OF PHARMACY, July, 1901.

Hynson, Westcott & Co. now employ 37 people altogether. In the main pharmacy, there are 8 pharmaceutical graduates, 4 assistant pharmacists, 3 finishers of pharmaceutical preparations, a receiving clerk, a delivery clerk, 2 bookkeepers, a stenographer, 2 janitresses and 6 porters and messengers. In the Linden branch are the manager, 3 graduates in pharmacy, a porter, and two messengers. The manager of the Linden branch is W. N. Owings, Ph.G., who has been in the employ of the firm for a good many years, and who will now share in the profits of the new store. The members of the firm are Henry P. Hynson, James W. Westcott, and H. A. Brown Dunning.

Establishing the Linden branch near a well-to-do residence neighborhood, Hynson, Westcott & Co. have sought to greatly increase their telephone order business. In a booklet gotten out to exploit the branch we find that patrons are urged to send in their orders over the telephone, and physicians are asked also to 'phone in their prescriptions. A com-

plete delivery service will be built up, and the firm hopes in this manner to reach out and corral business from quite distant points.

This is another view of the interior, showing more in detail the nature of the fittings and the decorative scheme. In the fixture at the right is the following legend: "Smoking objectionable."

THE IMPORTANCE OF THE PHARMACIST TO MANKIND.

An Address Delivered at the Celebration of the Twenty-fifth Anniversary of the School of Pharmacy of Northwestern University.

By OSCAR OLDBERG,
Dean of the School from 1886 to 1911.

This occasion belongs to Pharmacy.

I venture to call upon all Pharmacists present to begin here and now a vigorous campaign to compel full recognition of the great service rendered to mankind by the Pharmacist.

Such a campaign is urgently necessary and should have been begun years ago.

The public is ignorant of the fact that the Pharmacist is the sole agent to whom must be entrusted the enforcement of so much of the public health laws as relates to the drugs used in the practice of medicine. Let us try to remove that ignorance.

It is our right and duty to demand respect for the service rendered by our craft.

The campaign of education to secure acknowledgment of the importance of the Pharmacopœias, and of the work done by the specialists who carry them into effect, is evidently needed in every land.

This campaign may appropriately be begun in America.

The very life of Pharmacy depends upon the Pharmacopœias, and the Pharmacists of America have contributed much to make the Pharmacopœia of the United States respected.

All national Pharmacopœias are prepared and revised by physicians and pharmacists because they, only, are competent to perform that duty.

In our country the makers of the Pharmacopœia have rendered their services without compensation, and have presented to the American people a work which, considered as a whole, is the cleanest and best of its kind.

Let us explain to the public how the practice of medicine would be plunged into chaos in the absence of the national Pharmacopœias.

The Pharmacopœias are, in all countries, important parts of their system of protection of the

public health, and are, therefore, enforced as other laws are enforced—by the government and at the expense of the people.

But the governments have not told the people the reason of it. The Pharmacists must do that.

In our country the authority of the Pharmacopœia has been firmly established by the decisions of our courts for about half a century—thus long before the passage of the Pure Food and Drugs Act of June 30, 1906, to which many of our people ascribe the force of our national book of standards for medicines.

The actual condition of medicine and Pharmacy in the world cannot be discovered without studying the contents of the national Pharmacopœias. In this age men must widen their field of observation, and specialists in any land must learn what the workers in their field are doing in other lands.

Upon examination it is found that the national Pharmacopœias, whatever else they may contain, include the longest known and most thoroughly tested drugs and medicines. These drugs and medicines, having won and retained the approval of the medical profession, may be said to represent "the survival of the fittest." In that respect the Pharmacopœias are admirable.

But in view of their great and direct importance it is an astounding fact that no recognized or definite plan governing their construction seems to exist. The Pharmacopœias themselves furnish no evidence of it.

As Pharmacists we must protest against including in any national Pharmacopœia any drugs and preparations of such character that their presence in the book must compromise its dignity and scientific character.

As the Pharmacopœia of any country is, so will its Pharmacists be.

The national Pharmacopœias should contain no other remedies but such unmixed medicinal substances as are employed, singly or in conjunction with one another, by the medical profession.

But you will find that nearly all of the twenty national Pharmacopœias have, from generation to generation, continued to publish recipes for quack nostrums which men ought to know are used only by the very ignorant.

The national Pharmacopœias have come into existence within a century. Quackery was rampant and scientific medicine did not exist a century ago. You may say that such a positive assertion should

not be made by a mere Pharmacist, for it is not the function of the Pharmacist to pass judgment upon what constitutes rational medicine. But it is not necessary to be a cook to know that a recipe putting soap in a soup must be a failure.

Ridiculous nostrums put in the Pharmacopœias a century ago when actually employed by those who then practiced the art of healing are still retained in those books in this age of highly developed medical knowledge when physicians treat them with the contempt such rubbish merits.

The very titles given to some of these nostrums in the most recent Pharmacopœias serve as a warning somewhat as the sign of MEASLES nailed to the front of a house.

To men of sense these titles read: "Noli me tangere." Among them you will find "balm of life," "elixir of long life," "antiscorbutic syrup," "the prince's drops," and the like.

The history of "the prince's drops" is interesting. It is a solution of succinate of ammonium and the forerunner of "Spiritus Mindereri." (The spirit of Dr. Minderer has since been in purgatory and finally came out a clean solution of ammonium acetate.)

The original "prince's drops" was made of the ammoniacal liquor obtained by the dry distillation of deer's horn or of bones.

This liquor had a dirty brownish color, and its odor and taste were very offensive. Its alkalinity was neutralized with dirty succinic acid, which left the offensive odor and taste unimpaired. But a time came when these impure materials could no longer be found, and, as the ignorant people who had used "the prince's drops" as a household remedy continued to call for the preparation at the drug stores, and would not have been satisfied with an article not possessing the characteristics which to them constituted the best evidence of its curative powers, a new formula was devised for making the genuine "prince's drops" out of clean and pure ammonium carbonate and succinic acid by adding enough of the extremely offensive tarry distillation product of bones known in the drug market as "Dippel's animal oil."

This formula for a quite original imitation of the original article is still contained in several national Pharmacopœias.

One of the preparations contained in a national Pharmacopœia in force until 1908 had just 57 different ingredients—no more and no less—

while other national Pharmacopœias of earlier date order only 18 ingredients to be used in making that preparation, or one bearing the same title. We have heard the phrase "a distinction without a difference," but here is an instance of a difference without a distinction—quite inadmissible in medicine.

I am smarting in anticipation of severe criticism by friends who will tell me that it will never do to undermine due respect for the Pharmacopœias by stating such facts as these. I can only reply that they are facts, that I am not trying to undermine respect for the Pharmacopœias but the very opposite, and that I am convinced that the evil described, which is already of nearly a century's standing, will be most speedily eradicated whenever the friends of scientific medicine and Pharmacy abandon their silence and begin to discuss it.

If you should ask how it can be that scientific matter of the highest order is mixed up with old quack nostrums, the only explanation I have been able to discover is the pernicious notion that the Pharmacopœias exist solely or chiefly for the benefit and business convenience of the druggist. Were this true the Pharmacopœias could not be prepared and published at the expense of the people.

But the notion is as old as the Pharmacopœias themselves and has been tolerated without interruption out of pure inattention.

The practicing physician who notices the presence of the formulas for nostrums probably passes it over because he does not feel specially interested in remedies which he would not think of using, and so the whole matter is regarded as a harmless concession to the wishes of the druggist.

But I have found that whenever this view of it is brought to the attention of a right-minded druggist he wakes up and indignantly resents and repudiates it. Why, indeed, should he want any nostrums in his book of books?

One of the great objects of the national Pharmacopœias, in conjunction with other codes of laws and regulations relating to medicine and pharmacy, is that of rendering important drugs and medicines promptly procurable when needed. This is effectively accomplished in most countries by various means.

One of the means employed to that end is the classification of pharmacopœial remedies into two groups, one of which comprises the "obligatory" medicines which all Pharmacists must keep in stock

at all times, the other group comprising the "optional" medicines, which are valuable but which the Pharmacists need not keep on hand unless notified to do so. An optional remedy becomes obligatory whenever some physician tells the druggist that he wants to use it. Remedies which are obligatory without such special notification are indicated by an asterisk or other sign placed opposite their titles in the body of the Pharmacopœia, or are enumerated in a separate table at the end of the book.

Comparisons of the obligatory and optional remedies are interesting. You will find, for instance, that, before the advent of the iceman, physicians who found crushed ice a necessary remedy but not easily obtainable had it put into the Pharmacopœia as one of the obligatory articles. But it was decided that ice-bags required the use of beef bladders to hold the ice, and at least one national Pharmacopœia still includes beef bladders along with the obligatory remedies. When we remember how difficult it is to secure the exclusion of any article once admitted into the Pharmacopœia we are not surprised to find that beef bladders are still official, and can understand why ice is retained in several Pharmacopœias although it has long ago become a household necessity, and icemen and rubber bags are easily found.

Some national Pharmacopœias make tooth-powder or tooth-paste obligatory, together with kitchen spices, and other merchandise never ordered by physicians but sold at the drug stores.

Another of the means by which necessary medicines are made promptly procurable is the system by which the Pharmacies of continental Europe are made to yield a reliable and sufficient life income to their owners. The Pharmacies are limited to the number actually required according to population. It is reasonable under such a system to require the Pharmacies to be well stocked with all the obligatory remedies, but in our country this method is impracticable.

It is by no means impossible in our country to prevent the increase of Pharmacies beyond the number which can be profitably conducted in a manner compatible with the best technical service to the people, but this question must be settled by the Boards of Pharmacy. Our lawmakers are sometimes slow to admit that they cannot possess sufficient special knowledge of each and every subject upon which they must legislate, but valuable in-

formation and advice can always be obtained such as may render intelligent and effective legislation practicable.

All legislative proposals relating to Pharmacy should originate with the Pharmacy Board, for that Board represents the people of the State, and the State must make the practice of Pharmacy safe and efficient and at the same time do justice to the Pharmacist.

The great majority of men love fairness. We say, therefore, ignore those who make it their busi-

ness to amuse fools with the stale and cheap joke about the extortionate prices charged by the druggist. Intelligent men may be easily shown that the dispensing Pharmacist's individual responsibility and sense of duty, his personal character, skill, training and experience, and the protection which these guarantee to the sick—these, and not "cut rates," are the things which the public must take into account when they choose their Pharmacist.

A faithful Pharmacist is ever on guard and gives the public the full benefit of his special knowledge.

A WINDOW DISPLAY OF DIP.

The accompanying illustration of a window trim used by the Elam Drug Co., of Henderson, Ky., will serve to show what efforts many druggists are making to corral the dip business. It is notorious that the grocers and hardware dealers, particularly

pay the druggist. As a matter of fact the line is one of the most profitable a druggist can carry.

The Elam Drug Co. have a big window and use it to the utmost at this season. The glass is placarded from the floor to the ceiling with ads. of

in the country, carry coal-tar preparations, but the trade properly belongs to a pharmacy. Druggists in stock-raising localities should carry a stock of dip and let the people know it. If it pays the butcher, the baker and candlestick maker to sell dip, it will

a parasiticide. Pictures of cattle, sheep, horses, dogs and poultry are used profusely. The parasites themselves are illustrated on the signs, while stock packages of their arch enemy, dip, are displayed in abundance.

"MY MOST EXCITING EXPERIENCE."

A Druggist Narrowly Escapes Being Brained by a Tough Customer—A Jeweler Takes the Cyanide Route to Death.

LEMON SOURS AND THE BIG STICK.

By GEORGE H. ORSOR, ALBANY, NEW YORK.

When I received my certificate as a registered pharmacist, I was not the only one that was "de-lighted;" for the next day the proprietor packed his grip and said that he was going away for a few

"The proprietor said he was going away for a week."

days and perhaps a week. He hadn't had a vacation for years and thought it about time for him to take a rest. He hoped everything would move along smoothly, and it did excepting the second day of his absence. That furnished enough excitement to last me the rest of the week.

I remember it was a holiday, for I did not get down to the store until eight o'clock, and I had just opened the doors. In came my first customer, a large man with a nice black suit, a high hat, and a stout cane. He looked to me like a respectable shoemaker or blacksmith dressed up for a day's outing. He acted rather ugly when he came in, and I thought that he had taken an "eye-opener" or two. Stepping up to the soda counter he asked for a lemon sour, which I gave him. Then he walked over to the cigar case and asked for a

cigar, and he got that. He stood looking out of the window for a moment or so, when he ordered another lemon sour. He drank that, every drop of it, and here is where the curtain rises. He deliberately turned the holder upside down, about two feet above the counter, and let the glass drop out of it. As the marble slab was harder than the glass, you can imagine the result.

That made me mad, and I demanded: "You pay for that glass." "I won't," he replied, "and nobody can make me."

Just then a lady came in, and I had to leave him to wait on her. While I was thus engaged the junior clerk came in and went behind the soda counter for something. The big man stepped up to him and asked for a lemon sour. While he was drinking it the lady went out, so I went over to the soda counter. The man had just laid down a

"He went for me with his big stick."

quarter on the slab. The clerk picked it up and put it in the drawer. I told him that was right—there was no change coming, for that was what the man owed.

Thereupon the stranger went for me with his big

stick. I kept dodging him and moved toward the front door to see whether I could find a policeman or a friend to help me out of my dilemma. When I got to the door and was looking out, the man raised his big stick and was just about to give me a rap on the back of the head when a friend of mine came to the side door, took in the situation, and called out "Here, what are you doing there?" We both glanced around. The man lowered his cane and shot down the street as if the devil were after him.

"That was the closest call that you ever had in your life, Doc," said my friend. "Another second and he would have knocked you senseless, and we should have had to summon the proprietor home and spoil his vacation." I guess he was right.

A CYANIDE SUICIDE.

BY HERMAN B. MOORE, MAURY CITY, TENN.

About three years ago, late on a Saturday after-

noon, a man staggered into the store, and from his manner I judged that something unusual was wrong with him.

He began waving his arms and to issue a series of guttural sounds from which I presently understood that he wanted a "Doctor." I offered him a chair, but he pushed it aside and sat down on the floor, and proceeded to have what I thought was a fit.

Soon some one rushed in and said: "The man swallowed some of the stuff which he cleaned gold with." I at once thought I knew what he had taken, so I hurried around and got an antidote; but he died before I could get his mouth open.

He was a jeweler. I learned later that he had taken a large quantity of a solution of potassium cyanide which he used to restore gold and silver articles.

Whether he drank the poison on purpose or through mistake, no one knows. A bottle of whisky was found beside the cyanide solution.

A RETAIL DRUGGIST'S LABORATORY.—It might well be expected that a scientific man like Dr. C. B. Lowe, Professor of Materia Medica and a few other things in the Philadelphia College of Pharmacy, would have an adequate laboratory in connection with his pharmacy out in Germantown. This picture of the room is a flashlight taken by Dr. Lowe's son. Among other things it would seem from the table at the left that Dr. Lowe has a pretty good trade on effervescent solution of magnesium citrate.

DRUG-STORE SKETCHES.

THE TALE OF A DRUG CLERK.

BY MAXWELL BUKOFZER.

'Twas once upon a time there lived
 A drug clerk, young and willing,
 Into whose soul drug journals were
 Much "secret work" instilling.

Their expert and adept advice
 Most faithfully he studied;
 For Jim was piously convinced,
 That progress it embodied.

Confiding in this printed lore
 As in his godly Father,
 Jim ambled forth in search of work,
 A sustenance to gather.

He met with Mister Shake-it-up,
 Who offered a position.
 Jim started, mindful of the "Don'ts"
 And other erudition.

He labored hard, but lo! one day
 Poor Jim was asked to wander:
 "You do not shake things! You're too slow!
 We have no time to squander."

Jim called on Mister Do-it Right.
 He got the situation.
 Here he began his daily task
 With vim and animation.

Some moons had waned when once again
 James got his walking-letter.
 "You're superficial," growled the boss;
 "Do less and do it better."

Jim went to work for O. Chattap,
 Improved by former errors.
 Now neither speed nor thoroughness
 Bedimmed his heart with terrors.

The customers to please he strove,
 With brilliant conversation.
 Alas! most fatal of mistakes!
 His tongue lost him his station.

Next Jim at Mister Tell-a-joke's
 His daily bread got buttered.
 And there he vowed a fearful oath
 To choke each word ere uttered.

"Great Scott!" wailed Tell-a-joke at last,
 "I'm not a joke a-telling:
 You're either dumb or else a dope,
 With us you can't be dwelling!"

On Jimmy passed to Shabbycloth,
 Who had no use for col.lars.

Quoth he: "How can you dress so swell
 On measly fifteen dollars?"

Thereon in simple garments clad
 He clerked for I. M. Showy,
 To whom Jim's apparel seemed
 Distressingly scare-crowy.

When Jim at Pat. N. Stuff's prepared
 Some simple tussis-mixtures,
 The boss called him a quack and cried:
 "Sell things right from the fixtures."

This warning burnt into his mind,
 At Own Make's Jim ne'er tired
 To sing the nostrum's praises, until
 He suddenly got fired.

Thus Jim went onward pace by pace,
 Wholesale as well as retail.
 He mastered every subtle point
 Down to the smallest detail.

He learned just how to speak, to eat,
 To dress, to work for others,
 And he became a "model" boy
 For daughter-laden mothers.

He wed. The dowry he received
 Consisted in her freckles.
 Then he bethought himself that he
 Should now earn twenty shekels.

He got them. Dubbed now "manager,"
 Six months he had no Sunday,
 And as reward was given the
 Consilium abundi.

"You see," the boss explained, "it's this:
 "My trade has got a notion
 "That you alone are fit for them
 "To compound pill or potion.

"To-day a lass refused to buy
 "Of me a kidney-plaster.
 "She asked for you. Now, why should I
 "Play servant where I'm master?"

Jim went—and for a little while
 Went wild besides. Who wonders?
 He cursed melodiously at fate,
 And made three awful blunders.

First he got drunk. When wifey's ma
 Stopped him from cutting capers,
 He next—ye gods!—tore into shreds
 His drug journals and papers.

Lastly—it's terrible to tell—
 He who had been so clever,
 Equipped a store with trifling coin,
 And now slaves worse than ever.

BOARD QUESTIONS ANSWERED.

AN ILLINOIS EXAMINATION.

PHARMACY.

(Continued from April BULLETIN.)

5. Why should not a tin percolator be used in making fluidextracts of nux vomica, conium, and sanguinaria? (a) Why is a conical percolator generally used? (b) Why should the drug at the bottom of a percolator be packed more loosely than at the top of it?

Tin percolators cannot be used for any drugs containing principles liable to be affected by metal, or to be exhausted with acid menstrua. Of course, these three drugs are made with an acetic acid menstruum. (a) The drug has a tendency to swell, and there must be allowance for lateral expansion of the moist content. (b) The fluid draining down from the top is already concentrated on reaching the bottom of the percolator and there must be room to let it pass out. Furthermore, the weight of the top layer of drug exerts a pressure on the lower; so the drug at the bottom of the percolator is packed loosely to offset this pressure.

6. What is clarification? (a) How is it affected by the application of heat? (b) What effect has albumen in the process of clarification? (c) Why does fermentation sometimes clarify a liquid?

Clarification is the process of separating from liquids, without the use of filters or strainers, solid substances which interfere with their transparency. (a) When a viscid liquid is heated, its specific gravity is diminished, and frequently particles which were suspended in it and interfered with the transparency of the liquid will separate, the heavier ones falling to the bottom and the lighter ones rising. In the latter case, ebullition facilitates the separation; the viscid particles becoming enveloped in the minute bubbles of steam, rise through their buoyancy, and a scum is formed which may be readily separated. (b) The albumen coagulates, enveloping the particles that render the liquid cloudy. (c) The changes in the composition of juices after they have been fermented usually lead to the deposition of those substances which previously interfered with the transparency of the juices; the generation of alcohol through fermentation produces a liquid in

which the substances are insoluble, hence the formation of a deposit. The albuminoids in the juices are coagulated by fermentation.

7. How many pint containers will be required to hold 75 troy pounds of ether specific gravity 0.716? (a) How many to hold 75 avoirdupois pounds of glycerin specific gravity 1.246?

$5760 \times 75 = 432,000$ grains. One fluidounce of water at 62° F. in air weighs 455.382 grains. Hence $(432,000 \div 455.382) = 948.61$, the number of fluid-ounces occupied by 75 troy pounds of water. $948.61 \div 16 = 59.288$ pint containers needed for 75 troy pounds of water. $59.288 \div 0.716 = 82.844$ ans.

$75 \times 7000 = 525,000$ grains $(525,000 \div 455.382) \div 16 = 72.0548$, which $\div 1.246 = 57.828$ ans.

8. Give the formula and process for making unguentum hydrargyri. How is the percentage of mercury present determined?

Mercury	500 grammes.
Oleate of mercury.....	20 grammes.
Prepared suet.....	230 grammes.
Benzoinated lard.....	250 grammes.

Triturate the oleate of mercury in a warm mortar, add the mercury gradually by means of a pipette, and when the globules are completely divided and distributed, set it aside for about fifteen minutes. Melt the lard and suet, allow the mixture to partially cool, and add about 25 grammes of it to the mercurial mixture, and continue the trituration until globules are no longer visible under a lens magnifying ten diameters. Then add the remainder of the lard and suet and mix thoroughly.

To assay mercurial ointment, weigh ten grammes of it in a tared dish, melt it, then remove it from the fire and add 50 Cc. of warm petroleum benzin. Stir the mixture well, allow the mercury to settle completely, and decant the petroleum benzin. Wash the residue with successive portions of 10 Cc. each of warm petroleum benzin until it is entirely free from fatty matter, carefully retain all the separated mercury in the dish, and allow all traces of benzin to evaporate. Add to the residue 10 Cc. of diluted hydrochloric acid, heat it gently, and stir with a glass rod until the mercury collects in a globule. Pour off the acid, warm the mercury with a little distilled water, dry the globule on bibulous paper, and weigh. The mercury should weigh not less than 4.9 grammes.

9. What causes the discoloration sometimes present in tablet triturates of calomel and soda? Does such discoloration impair their value?

The tablets absorb moisture and there is a re-

action between the ingredients with the formation of black mercurous oxide. This does not impair the medicinal value of the tablets as the same reaction takes place in the stomach.

10. What is the distinction between ointments and cerates? (a) Why should an ointment having a trace of rancidity be rejected? (b) Why is petrolatum regarded as a good base for ointments in certain cases?

Cerates differ from ointments in containing a considerable proportion of wax, and frequently also rosin or oleoresinous substances. They are harder than ointments and do not liquefy at the temperature of the body. (a) A neutral oil is bland and inoffensive in smell, while fatty acids are irritating to a tender, excoriated surface and are also vile in odor. Moreover the acid may tend to decompose the ingredients. (b) Some ointments are intentionally non-absorbable, being used to produce some medicinal effect on the outer skin, such as astringent, counter-irritant, antiseptic, germicidal or similar effect, or possibly as protective agents. These may be made with petrolatum as it is less readily absorbed than, say, lard or lanolin. Moreover, it never gets rancid.

11. Name ointments in which a metallic spatula should not be used and give the reason for same. (a) Why is paraffin an objectionable substitute for wax in ointments?

Whenever substances likely to attack metal are ordered in ointments, the incorporation with the fatty vehicle should never be made with steel spatulas, but always with horn or rubber spatulas; the latter can now be had quite pliable, and are admirably adapted for ointments containing salicylic acid, tannic acid, iodine, mercuric chloride, oxides of mercury, etc. (a) Paraffin is apt to granulate. It does not produce so smooth an ointment as wax.

12. Why does the Pharmacopœia direct that digitalis leaves be used instead of a fluidextract in making infusion of digitalis? (a) What active principles are contained in the finished product?

Digitoxin and other objectionable principles soluble in a hydroalcoholic menstruum are absent in the infusion made from the leaves with water; but they are normally present in the fluidextract made with diluted alcohol. (a) Chiefly digitonin and digitalin.

13. Why is purified talc used in making official waters? (a) What advantage has it over calcium phosphate in making medicinal waters? (b) What

objection is there to the use of magnesium carbonate?

Thorough trituration with an insoluble powder causes division of the oils into minute particles, in which condition they are readily dissolved by water. (a) Calcium phosphate is not a good medium for division of the oils, and is frequently found impure from contamination with soluble matter. It favors the growth of germs and molds. (b) Magnesium carbonate is not desirable, as it is not wholly insoluble, and this fact has often given rise to trouble, as in the case of cinnamon water, which invariably has a yellow color when made with this agent, and in the case of mixtures of medicated waters with lime-water magnesium carbonate produces turbidity. It precipitates alkaloids also, which is one of the main objections to it.

14. How is aromatic spirits of ammonia prepared? (a) What is required in the selection of the ammonia used? (b) Why must the product be set aside twenty-four hours before being filtered?

To the ammonia water contained in a flask, add the greater part of the water, and afterwards the ammonium carbonate reduced to a moderately fine powder. Close the flask and agitate the contents until the ammonium carbonate is dissolved and allow it to stand a half day. Pour the alcohol into a graduated bottle of suitable capacity, add first the oils, then gradually the solution of ammonium carbonate, and afterwards enough water to make up the required volume. Set the mixture aside for a day in a cool place, occasionally agitating, then filter it through paper in a well-covered funnel. (a) Have a translucent ammonium carbonate. (b) A white crystalline precipitate often falls when water is added, which disappears on standing.

15. Of what are Seidlitz powders composed? (a) Why are small wooden measures used for measuring these powders objectionable? (b) What quantity of material will be required to make one dozen of these powders?

Sodium bicarbonate, potassium and sodium tartrate, and tartaric acid. (a) As a rule they are not uniform. (b) Sodium bicarbonate 31 grammes, potassium and sodium tartrate 93 grammes, and tartaric acid 27 grammes.

16. What is the official title for sweet spirits of nitre? (a) Of what is it composed? (b) How should it be kept in stock, and why is it necessary that the caution be observed? (c) For what purpose is sodium and potassium carbonate employed?

Spiritus Aetheris Nitrosi. (a) An alcoholic solution of ethyl nitrite containing not less than four per cent of the ester. (b) In small, well-stoppered, dark amber-colored vials in a cool place remote from lights or fire. It tends to decompose. (c) The former to neutralize the acid present, the latter to remove traces of water.

17. Why should bismuth subnitrate and a carbonate or bicarbonate not be prescribed in aqueous mixture? (a) Why should antipyrin not be given with calomel?

In the presence of water the alkali carbonates and bicarbonates convert the bismuth into the subcarbonate, and at the same time some carbon dioxide is liberated. (a) In the presence of moisture calomel is slowly turned dark by antipyrin. The calomel is reduced.

(To be continued.)

DOLLAR IDEAS.

The editor of the BULLETIN will pay \$1 in cash for every practical idea accepted for this department. What is wanted are good formulas, dispensing kinks, book-keeping suggestions, business plans, advertising schemes, new soda drinks, and everything else of a novel and useful nature.

TO UNCORK BULK BOTTLES OF PILLS AND TABLETS.

Frank J. Kersenbrock, Columbus, Nebraska: Very often pills and tablets in lots of 5000 come put up in wide-mouth bottles and are invariably stoppered

with thin corks which fit flush with the top of the bottle. Unless these stoppers are replaced by larger corks that stick out above the lips of the bottles one must use a corkscrew every time he wants to take

out 10 cents' worth of pills. This is a waste of time and also wears out the cork. Try this:

Put a hole through the center of the cork, tie a string around the neck of a collar button and pass the smaller end through the bottom of the cork as shown in the accompanying illustration. In place of using a bone collar button an ordinary button will do. If one does not want the end of the string to stick out away from the bottle, a shoe button can be used at the end instead of the knot as on my model. Then the string will hang down alongside the bottle.

In putting the cork into the bottle it should be so placed that the string will hang out. To open the container just pull up the string and the cork will come out with ease.

OPENING STRONGER AMMONIA WATER.

A. Lomax, Adelaide, Cape Colony: This is an idea I thought of only lately. Had it occurred to me before, it would have proved very useful to me during these years in opening containers of stronger ammonia water.

Wrap a wet towel around the bottle and set the container outside in the shade for at least half an hour, keeping the towel constantly wet. The ammonia will not rise out of the bottle. But as a safeguard it is always advisable to turn one's face away from the bottle on opening it, at the same time leaving the towel over the stopper. When an apprentice I saw a man open a Winchester of stronger ammonia water on the serving counter. It was a hot day and the ammonia rushed out of the bottle. We ran to the nearest door to the air. When we were able to return to investigate, we found that instead of containing half a gallon, the package contained only half a pint.

GETTING BUSINESS ON RAT VIRUS.

Andrew F. Reinders, Mt. Pulaski, Ill.: We had been selling Azoa with indifferent success, but finally hit upon the following plan: Catch a few rats in a wire cage-trap and feed them on nothing but the Azoa mixture for a few days. Then turn them out of the trap or set them free so that they may return to their former associates and mingle with them. In this way they communicate the disease to their fellow rats and the results are soon apparent.

LETTERS.

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

THE TEN-HOUR DAY.

To the Editors:

In the evolution of the science of pharmacy—and we must all allow that the scenes and conditions, in the practice of the art, are rapidly changing at the present day—I am inclined to wonder much; and ask my brother pharmacists what the end is going to be, especially for the smaller pharmacy in the cities and towns, where only the proprietor and one clerk are needed to run the store, with the aid possibly of an errand boy.

The question has been more forcibly brought to my mind recently by the flood of legislation that has in the past two or three years been introduced into the various State legislatures, regulating and restricting druggists and drug stores in nearly everything they do, from early morning until late at night.

I will acknowledge much of this legislation was needed. The pure food and drugs law, the restrictive measures in regard to the sale of cocaine, morphine, opium, etc., belong to this class.

One measure in particular, that is before the present Connecticut legislature, I am opposed to and think every other pharmacist ought to be also, and the attention of pharmacists generally ought to be called to it, as it is liable to spread through every State in the union unless vigorously opposed. I refer to the so-called "sixty-hour-a-week" drug clerk bill. This bill provides that no prescription clerk shall be employed more than ten hours a day or sixty hours a week, under a penalty of a \$500 fine. I understand this measure or a similar one is already a law in California; I believe it is also before the Massachusetts legislature.

Now, imagine please what would the proprietors of the vast numbers of drug stores in this country do, who are able to employ only one prescription clerk, if that clerk were permitted by law to work only sixty hours a week?

Let us suppose the average working hours in a drug store are 100 hours a week, which I think are a fair average. This proposed law means that the

clerk will only be on duty 60 per cent of this time. The remaining 40 per cent, or nearly half the working hours, the proprietor will be left alone. Now, how is the proprietor of that store going to arrange the working hours of that clerk, on a ten-hour schedule, so as to have him working during the busy hours of the day when he needs him most, or how is he going to get any help from him evenings or Sundays? I claim it is impossible to so arrange it.

I am opposed to this measure, not that I am against shorter hours for drug clerks, but that I think sixty hours is unreasonable under existing conditions.

One of the arguments used in favor of this bill is that the drug clerks are subject to long hours and are overworked, thereby becoming liable to make mistakes and errors. I claim that the average clerk is not overworked. He is not in the same class with the man at the bench in a shop or factory, forced to work at high tension to get out a certain amount of work, in order to get a day's pay. Instead, he has many leisure moments in which to chat with friends, read the papers, or relax if so inclined.

I doubt whether this proposed law is constitutional, or can be enforced, if vigorously fought by the drug trade. A similar law was recently enacted by the New York legislature, limiting the number of hours a man could be employed in a baker shop. When contested in the courts, the New York Court of Appeals held it valid, while the United States Supreme Court reversed that decision. Now, if the law regulating the working hours of bakers would not hold, it follows it would hardly hold as regards drug clerks.

It seems to me the hours a clerk works should be a matter of adjustment between the clerk and his employer, taking into consideration the local conditions in that particular store, the class of trade catered to, the amount of business transacted, the work expected of a clerk and the salary paid.

If drug clerks generally favor this sixty-hour law and it is put into effect, I can see where the clerk comes to work like any shop or factory employee, registering in on the time-clock when he goes to work, registering again when his day's work is completed, getting paid by the hour instead of the day or week; if he loses any time from sickness or vacations, he loses his pay also.

So, all things considered, I feel this sixty-hour

law is ill advised, both for the welfare of the clerk and the proprietor too, and I hope druggists and clerks both will endeavor to defeat this measure, whenever and wherever it comes up.

Bristol, Conn.

BURTON L. BENNETT.

[NOTE BY THE EDITORS.—We shall be glad to hear from the clerks if they have any views to offer on this subject.]

BOOMING THE SPRAY BUSINESS.

To the Editors:

I am getting four monthly drug journals and have failed at any time to see any letters or editorials pertaining to spraying material or insecticides, such as are used for spraying fruit trees.

There is no question but that this is a line of trade that should go directly to the drug store. All these articles are of a poisonous nature and can be dispensed by druggists in broken or original packages to a decided advantage over other dealers who must sell in original packages only. The druggist should post himself thoroughly along this line of work to advise his clients intelligently what to use, how to use it, and when. This information can be had from experimental stations or chemical manufacturers of spraying material.

The insecticide trade is offering to-day one of the biggest opportunities to the drug trade of anything that has presented itself for the past 25 years. One of the largest paint manufacturers recently announced at their directors' meeting that it will be but a short time before his insecticide line will be so big that his paint business will be a side issue. And to verify this he is spending over half a million dollars in equipping plants in three branches of his house.

Now, fellow druggist, what are you going to do? Will you let this business get away from where it belongs and let the other fellow gather it in? The field is so big you cannot afford to let it pass by. Get into position to talk spraying and insecticides intelligently. Go after the spray business and go after it hard. Along with this line handle all accessories, such as spray pumps, etc. This is no advance thought, but now is the opportune time.

Why have the drug journals not taken this matter up? They surely are educators and many druggists look to them for advice and new ideas. This line is so extensive that the journals could devote a separate department to it. Would it pay them?

Most assuredly. Let them show an interest in this work by bringing it before the druggists by letters or editorials and see how soon the manufacturers will place contracts for advertising space for their products. Let the journals give the druggists a little solid food, instead of a lot of windy, indigestible board meeting minutes.

About one year ago lime and sulphur and arsenate of lead was not used here. I started to talk insecticides and spraying, gave out literature to fruit growers, had my mailing list used by insecticide manufacturers. At the present time the indications are that business in this line will exceed all other side-lines combined. This is new business, business the other fellow would have gotten.

Let this be taken up by the druggists in letters to the journals, and have the journals meet them halfway.

O. W. WINKELPLECK.

Sugarcreek, Ohio.

THREE OR FOUR SUGGESTIONS.

To the Editors:

Permit me to say that I certainly had a dollar's worth of fun, not to mention several dollars' worth of splendid ideas, from your March BULLETIN, which came in Sunday when I was so indisposed with a cold as to be confined to the house all day.

In your Dollar Idea department for March, page 119, I note a new preparation for rose-water. In my own formula, I use attar of rose in place of the rose extract, 24 minims to the gallon, triturate it with the powders, and add boiling hot water and filter. This makes an excellent rose-water free from alcohol.

I have prepared a toilet lotion of quince seed, witch-hazel, etc., very similar to the formula given by R. L. Dixon on page 125 of the March issue and have enjoyed a nice sale on it for several years. I color it violet and use a violet-trimmed label, naming the preparation "Violet Cream Lotion." I have one customer who has moved away and who orders a dollar's worth of the lotion every fall to be expressed to her home in Dakota.

A customer called one day saying he wanted something and could not remember the name, but it sounded something like "Sally-hit-the-path." I wrapped up a package of sal hepatica, and I think Sally hit the path all right!

D. A. FRICK.

Audubon, Iowa.

PRICING A BULK PRESCRIPTION.

To the Editors:

In the BULLETIN OF PHARMACY for March, 1911, page 126, appeared a prescription together with a discussion of the price:

Strychnine sulphate	16 grains.
Sol. arsenic chloride.....	3 ounces.
Quinine sulphate.....	640 grains.
Tr. of iron,	
Glycerin, ää.....	1 pint.
Aqua, q. s.....	4 pints.

In regard to the price on that particular prescription I will say that both contributors are wrong in the prices which they give. Whenever a formula of such nature is brought into my store, I consider the following important facts:

1. Any patient that has a prescription for $\frac{1}{2}$ gallon will surely try to buy it as cheaply as possible.

2. In cases where the formula calls for more than 500 Cc. it is advisable for the pharmacist to consider himself as a business man and not as a scientific man.

3. There is no doubt in my mind that the patient is entitled to a close price. I cannot see, though, why a man who buys a half-dozen should get the same price as the man who buys a gross or more.

Therefore in such cases cost price of articles should be figured and a certain per cent added for profit, thus:

		Cost.
Strychnine sulphate	8 grains=	8 cents.
Soluble arsenic chloride.....	3 ounces=	5 cents.
Quinine sulphate	3 grains av.=	26 cents.
Tincture of iron.....	1 pint=	45 cents.
Glycerin (sp. gr. 1.25).....	1 pint=	33 cents.
Bottle	=	25 cents.

Approximate value—\$1.42 cost.

Now, $100:50::142:\times=71c.$

\$1.42
.71

\$2.13

Therefore, I think if a druggist would charge for this prescription \$2.25 or so, when he would make a profit of about 52 per cent, he ought to be satisfied, and the patient likewise. The customer would surely call again in the same store to buy some other drugs, when the pharmacist could charge enough to compensate him for the half-gallon dispensed so cheaply.

RICHARD M. ALTMANN, PHARM.D.

Dorchester, Mass.

PAPERS FOR THE A. PH. A.

To the Editors:

Would it be possible for you to include a short note in the next issue of the BULLETIN OF PHARMACY requesting persons interested in the Section on Education and Legislation of the A. Ph. A. to notify me if they will prepare a paper for the Boston meeting in August?

It seems rather difficult to get people interested even to the extent of a promise of a paper. An invitation to prepare a paper inserted in your journal may catch some one whom I would not reach by letter.

CHARLES W. JOHNSON,

Chairman Section on Education
and Legislation, A. Ph. A.

School of Pharmacy, University of Washington, Seattle,
Washington.

THE OLD MAN WOULDN'T PAY IT!

HIS OPINION.

To the Editors:

In response to your recent request that readers tell what they wanted or expected in the BULLETIN, I will say that your new department of "General Essays" is a good one and I hope to see the depart-

BUSINESS HINTS.

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

One Way to Sell Borax.—

The average druggist will sell a box of borax for 5 or 10 cents, and be satisfied with a small sale. George B. Evans, the owner of five or six big drug stores in Philadelphia, gets up a handsome package, puts in a little violet odor, and has no trouble in getting 25 cents. We are reproducing the label used on the Evans container. The cut fails, however, to give

any idea of the beauty of the design. In the original the violets are printed in color, and the work is so well done that they look like real flowers. The paper is roughened to heighten the effect. All of which goes to show that these big druggists, who are popularly supposed to be cut raters and doing business at a small margin, know how to make more money than the rest of us.

An Array of Show Cards.—

J. M. Ciechanowsky, of Manistee, Mich., is quite adept in the art of sign painting. Some of his work is reproduced in the accompanying illustration. If, in photographing the

show cards, they had been set up against a plain background, preferably a dark one since the cards are light, better justice would have been done to the subject.

A Full-page Newspaper Ad.—

Not often does a druggist use a whole page in the newspaper. Recently, however, the *Daily Gate City*, published in Keokuk, Iowa, had such an ad. which had been inserted by

CAPSULES OF SCIENCE.

Prepared by Prof. W. L. SCOVILLE.

Some Summaries.—

Most of the lecithin in the market is made from egg-yolk, but a French chemist claims that there is no lecithin in eggs.

By treating quinine with diglycollic acid chloride, a compound is formed which is said to be tasteless but very active when taken into the system.

Talc takes out coloring-matters, starch, gums, albumins, and other colloidal materials from solution, to some extent, but does not absorb crystalloids.

Copper-clad steel is being introduced for telephone wires, structural work, and in places where steel corrosion is to be avoided.

Let some isoprene stand in the dark $2\frac{1}{2}$ years and you will get some real rubber—enough to test. It polymerizes.

One-tenth of one per cent of calcium dioxide will preserve milk for three months or more.

Boiled meats do not digest as rapidly as raw meats, but meats roasted at 140° C. digest as rapidly as the raw.

It is stated that there are over 300 forms of pocket ignition devices, as well as gas igniters, now in use.

L. Debourdeaux says that about 10 per cent of the morphine present in opium is insoluble in water, and requires calcium hydroxide to make it soluble.

M. Nierenstein says that the alkaloid in guarana is not caffeine, but a principle very closely related to it. He calls it beta-guaranine.

Violet rays are said to kill plant cells, but not the enzymes contained in them. The action of these rays resembles that of anesthetics.

French lavender oil has been found to contain small quantities of thymol and of nerol.

The sugar production in Cuba is increasing rapidly at the rate of about a quarter of a million tons per year. Next year's yield is estimated at two million tons.

French chemists claim that if medicinal leaves be treated when fresh with alcohol vapor, under slight pressure, the enzymes are destroyed and absolutely stable liquid preparations can be prepared from them.

Metallic radium has been isolated as a bright, white metal, melting at 700° C., and turning black rapidly when exposed to the air. It decomposes water, attacks quartz, and blackens paper.

Phenol-oxalate is being introduced as a superior disinfectant. It decomposes in water, and is claimed to act more effectively than pure phenol.

A mixture of 40-per-cent camphor and 60-per-cent phenol solidifies at -30° C. (-22° F.). In other proportions the freezing point is higher.

The reason that boiling water destroys enzymes while a dry heat of 100° C. does not, is that the enzyme hydrolyzes in the hot water—so government chemists say.

Otto and Kooper say that strychnine and nicotine are not changed in soils, but that they alter the development of plants grown in the soil to which these alkaloids have been added.

Not Solanin, but Toxin.—

Poisoning by sprouting potatoes has been considered to be due to the abnormal amount of solanin which they contain. It is now claimed that the potato cannot develop enough solanin to be poisonous, but that warm potatoes which are infected by putrefactive bacteria may develop enough toxins to be poisonous.

A Successful Failure.—

Artificial camphor is a success in so far as its physical and chemical properties are concerned, but commercially it is not a success. A French firm, capitalized at about one and a half million, is not finding it profitable, and its manufacture may be abandoned.

Burn Gas.—

W. B. Smith says that gas is the ideal fuel for common household use. He claims that it does not dry the air as much as a coal fire, and that it is quite as healthful as a coal fire, and for intermittent use it is considerably cheaper.

Off Color.—

Alkalies intensify the color of caramel, and caramel has been found adulterated with sodium carbonate to the extent of 50 per cent. Such adulteration is easily detected by use of acids.

Something New in Cacao Butter.—

The odorous principle of cacao butter has been isolated. It is a ketone of nearly the same composition as oil of rue, and has a similar odor. It occurs in very small amounts in cacao butter.

A New Remedy.—

A little radium sulphate worked into glass is claimed to produce a glass which is permanently radioactive and suitable for medical or scientific use.

BOOKS.

ANOTHER BOOK ON PHARMACY.

"The Student in Pharmacy," by E. G. Eberle, comes to us from the press of the *Southern Pharmaceutical Journal*, Dallas, Texas. For the most part it goes briefly over the ground covered by the regular text-books on pharmacy, although without any effort to incorporate the material found in the Pharmacopœia and the National Formulary. There are chapters, for instance, on distillation, heat, comminution, percolation and the like. There are also chapters on the different classes of preparations in the U. S. P., such as syrups, glycerites, wines, tinctures, fluidextracts, etc. In the rear of the book are a number of pages devoted to questions and answers, percentage solution tables, incompatibilities, dosages, and other subjects of practical interest. In this section of the book we are pleased to notice the reproduction of a number of articles originally contributed to the BULLETIN OF PHARMACY. The book is bound in cloth and the price is \$2.00.

QUERIES.

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

The Quantitative Assay of Phosphoric Acid.

P. E. D. writes: "I should like to have some of the readers of your valuable paper answer the following for me:

"The quantitative test for acidum phosphoricum, U. S. P., says: 'If 10 gm. of phosphoric acid be diluted to measure 100 Cc., then 9.73 Cc. of this solution, when diluted with 10 Cc. of cold saturated solution of sodium chloride, should require 17 Cc. of normal potassium hydroxide V. S. for neutralization (each Cc. corresponding to 5 per cent of absolute phosphoric acid), phenolphthalein T. S. being used as indicator.'

"Why should 9.73 Cc. of the diluted solution be used, and not 10 Cc., and why 10 Cc. of cold saturated solution of NaCl, and not 9.73 Cc.? Why is NaCl used at all, and why a cold saturated solution? Why should this require 17 Cc. of normal KOH V. S. for neutralization (each Cc. corresponding to 5 per cent of absolute $H_3(PO_4)$)? How is it that each Cc. of the normal potassium hydroxide V. S. corresponds to 5 per cent of absolute phosphoric acid? Isn't it just as well to use any solution of potassium hydroxide of known strength, freshly prepared?"

In the titration of this acid by U. S. P. method it is supposed that you are testing an acid of U. S. P. strength (85 per cent), and if so, you would take exactly 17 Cc. of normal KOH for the following reasons: In the U. S. P. methods of assay all acids are first weighed so that a proportionate part can be taken, and that part is so regulated that the amount of N/1 KOH can be anything you desire to have it. In this case each Cc. represents 5 per cent because 17 Cc. are taken and 85 divided by 17 equals 5 per cent in each Cc.

In order to figure back the correct weight to take in order that it should form K_2HPO_4 with phenolphthalein with 17 Cc. it is necessary to figure the amount of H_3PO_4 the N/1 KOH would react with, which is given in U. S. P. as .048645 gramme. Therefore 17 Cc. would react with 17 times .048645, or .826965 gramme. If one gramme of acid was taken to start, the acid would therefore be that amount divided by 1 or 82.69 per cent; as this acid is supposed to be 85 per cent and not 82.68 per cent, some number less than 1 gramme is taken, which is found by dividing .826965 by 85 or .9728 gramme. Now in U. S. P. 10 grammes of acid is diluted to 100 Cc. and 9.73 Cc. containing .973 gramme of acid is taken.

In regard to use of NaCl, the later edition of U. S. P. 8th revision reads, "to a cold saturated aqueous solution containing 5 gms. of NaCl." This NaCl has nothing to do with actual chemical reaction, but the indicator (phenolphthalein) when used with H_3PO_4 is very faint, and NaCl is used to make color more pronounced, and therefore the amount to be used is optional.

Depilatories.

H. & J.—Depilatories are preparations for removing hair. They are most often in the form of powder, which should be in impalpable condition. The main or active ingredient is usually sulphide or sulphhydrate of one of the alkalies or alkaline earths, although the older depilatories were made with caustic alkalies. In using these depilatories they should be made into thin paste with water, applied in a thin layer to the skin, allowed to remain a few minutes and then scraped off with a blunt instrument, when the hair will have softened sufficiently to be removed without pain.

LIQUID DEPILATORIES.

Here is a formula from *Monatschr. für Dermatologie*, and recommended by Dr. Butte:

- | | | |
|-----|------------------------|---------------|
| (1) | Alcohol | 12 grammes. |
| | Iodine | 0.75 gramme. |
| | Collodion | 35 grammes. |
| | Oil of turpentine..... | 1.50 grammes. |
| | Castor oil | 2 grammes. |

Apply the mixture to the part from which the hair is to be removed once or twice daily for three or four successive days, increasing from day to day the thickness of the layer.

- | | | |
|-----|------------------------------------|-----------|
| (2) | Sodium sulphide, crystallized..... | 3 parts. |
| | Powdered quicklime | 10 parts. |
| | Powdered starch | 10 parts. |
| (3) | Powdered quicklime | 1 part. |
| | Sodium carbonate | 2 parts. |
| | Lard | 8 parts. |

Apply and remove after two or three minutes.

- | | | |
|-----|--|----------|
| (4) | Barium sulphide,
Powdered quicklime,
Powdered starch, equal parts. | |
| (5) | Powdered quicklime | 8 parts. |
| | Potassium carbonate | 1 part. |
| | Potassium sulphide | 1 part. |

This is known as "Chinese Depilatory," and, when finely powdered, should be kept in a well-closed bottle.

Too long contact of depilatories with the skin should be avoided, as they are liable to cause erosions and even ugly sores. To avoid any bad after-effect, the skin should be thoroughly cleansed and then anointed with a bland oil.

Silvering Iron.

I. R. wants a formula of a liquid for silvering iron.

There are upon the market various fluids, called "silvering fluid," "eau argentine," etc., which impart to clean and bright metal objects, simply immersed in them, a brilliant but very thin silver coating. The following is a formula for such a fluid:

Silver carbonate, 1 part; sodium hyposulphite, 10 parts; water, 10 parts. The silver carbonate is obtained by pouring a soda solution into a solution of silver nitrate, the resulting precipitate being washed and dried. Or it need not be dried, but simply put into a glass vessel with the crystals of sodium hyposulphite, where water is poured over it and the solution hastened by frequent stirring. The fluid is then poured off from the undissolved residue of the silver carbonate. The objects immersed in it are to be touched with a zinc rod.

TO SILVER CAST IRON.

To silver cast iron, 15 grains of silver nitrate are dissolved in 250 grains water, and 30 grains of potassium cyanide are added; when the solution is complete, the liquid is poured into 700 grains of water wherein 15 grains common salt have been previously dissolved. The cast iron intended to be silvered by this solution should, after having been well cleaned, be placed for a few minutes in a bath of nitric acid of 1.2 specific gravity just before being immersed in the silvering fluid.

Deodorizing Benzine.

F. S. J.—Benzine, as well as other petroleum distillates, may be purified by the official process in the U. S. P. The

Following is another process: Add to the benzine 1 or 2 per cent of oleic acid, which dissolves, and then $\frac{1}{4}$ per cent of aqueous solution of tannin, which incorporate by thorough agitation. A quantity of solution of caustic potash or milk of lime sufficient to combine with the acids is then well shaken with the mixture and the whole allowed to stand. The benzine rises to the top of the aqueous liquid, sufficiently deodorized for all practical purposes.

The following process has been patented in Germany for disguising the odor of benzine and other petroleum distillates: Add to the liquid a volatile oil containing a terpene such as oil of turpentine, fennel, caraway, lavender, pine needles, eucalyptus, etc., and then an alkali. If the benzine is mixed with one per cent of oil of fennel, warmed to 70° C., then agitated with 2½ per cent of solution of soda, specific gravity about 1.30, and allowed to stand till the benzine separates from the aqueous liquid, the former will have merely an odor of fennel.

Cachous: Breath Perfumes.

G. W.—We do not know the composition of the proprietary breath perfume which you mention, but the following formulas may be useful:

They consist of various aromatics combined with licorice extract, sometimes sugar, the whole being formed into a mass which may be divided into pellets, or it may be rolled out in a thin sheet and cut into little squares, or it may be rolled out into a very thin pill "pipe" about the size of a knitting needle, which may then be cut into short sections. After dividing the mass, the particles may be dried. If desired, the pellets may be silver-coated.

- (1) Oil of peppermint.....25 drops.
 Oil of lemon.....15 drops.
 Oil of neroli.....15 drops.
 Oil of cinnamon.....15 drops.
 Clove½ drachm.
 Cardamom1 drachm.
 Vanilla1½ drachms.
 Orris root2 drachms.
 Mace5 drachms.
 Sugar4 drachms.
 Licorice extract, powder.....1 ounce av.
 Mucilage of gum arabic.....sufficient.

Reduce the drugs to powder, add the remaining ingredients, make a mass and divide into pills weighing 1 grain each, or roll out flat and cut into small pieces.

- (2) Musk1 grain.
 Civet1 grain.
 Oil of vetiver.....1 drop.
 Oil of rose.....5 drops.
 Carmine5 grains.
 Tartaric acid10 grains.
 Gum arabic2 ounces av.
 Sugar8 ounces av.

Mix the ingredients intimately, forming a powder, add enough water to make a dough, and make into pellets.

Decolorizing Tincture of Iodine.

F. V. W. asks: "What crystal is used to decolorize tincture of iodine, or what solvent will accomplish that best without weakening the tincture too much?"

You might try crystals of sodium thiosulphate. There is a decolorized tincture of iodine which is made as follows: Digest at gentle heat a mixture of iodine, sodium thiosulphate, and water until a perfectly dark solution results; alcohol is then added, and afterward stronger ammonia water; when the liquid has become colorless and cool, sufficient alcohol is added to make up the required volume. The finished prepara-

tion is chiefly a hydroalcoholic solution of sodium and ammonium iodides, and the name decolorized tincture of iodine does not seem appropriate.

Filtering Gasoline for Motor Cars.

G. T. wants to know whether there is any method whereby chamois skin, leather, or similar substances can be prepared for filtering gasoline so that they will reject the water. The skin is to be stretched tight and a mixture of gasoline, dirt, and water is to be filtered, leaving no traces of any foreign matter in the filtered product.

We are informed by the automobile experts that ordinary chamois skin as procured on the market has the property of retaining water and dirt while the gasoline passes through. The chamois skin is suspended in a funnel. After the gasoline passes through, the water and dirt will be found collected in the bottom of the chamois and may be easily rejected. No special method of treating the skin is necessary.

Sweeping Compounds.

W. F. E. Co.—According to a patent issued in 1905, this is composed of sawdust, silicious material, rosin, oil, and tar. Another patent calls for catechu, 1 part; mineral oil, 8 parts; sawdust, 16 parts; bran, 32 parts; sand, 48 parts; and water containing a small amount of nitrobenzene, 32 parts.

This is offered as a good formula:

Paraffin wax	1 ounce av.
Paraffin oil	2 pints.
Salt	4 ounces av.
Sea sand	4 pounds.
Sawdust	5 pounds.
Oil of eucalyptus.....	1 fluidounce.

Melt the wax, add the paraffin oil, incorporate the sand, salt, and sawdust, and finally add the oil of eucalyptus.

Cleaning Wall-paper.

O. B.—Here are three methods of cleaning wall-paper:

(1) To remove all stains or marks, where people have rested their heads, from wall-papers, mix pipeclay with water to the consistency of

FOUR KNIGHTS OF THE GRIP.—These representatives of Parke, Davis & Co. were photographed not long since while standing in front of the Congress Hotel in Pueblo, Colorado. Reading from right to left are H. A. Allshouse, Dr. R. L. Black, W. H. Raleigh, and Frank J. Heusel. Mr. Allshouse is manager of the Department of Traveling Service in the Kansas City branch.

cream, lay it on the spot, and allow it to remain until the following day, when it may be easily removed with a penknife or brush.

(2) If not very dirty, the paper of any room will be much improved by brushing it over in straight lines with a soft broom covered with a clean, soft cloth; if, however, the paper be much soiled, very stale bread is the best thing to clean it with.

(3) The following has been recommended: Mix together 1 pound each of rye flour and white flour into a dough, which is partially cooked and the crust removed. To this 1 ounce common salt and $\frac{1}{2}$ ounce of powdered naphthalene are added, and finally 1 ounce of corn-meal and $\frac{1}{4}$ ounce of burnt umber. The composition is formed into a mass of the proper size to be grasped in the hand, and in use should be drawn in one direction over the surface to be cleaned.

Hair Dyes.

O. D. R.—We do not know the composition of the proprietary hair stain which you mention, but the following formulas are suggested by the *Pharmazeutische Zentrallhalle*:

Nutgalls	50 grammes.
Water	300 grammes.
Ferrous sulphate	10 grammes.

Boil the nutgalls in the water, strain, in the colate dissolve the iron salt, and evaporate the liquid to two-thirds its original volume. This stains the hair brown.

The following is said to yield a dye which stains the hair brown immediately upon application:

Gallic acid	10 grammes.
Ferric chloride	8 grammes.
Water	100 grammes.
Acetic acid	8 grammes.

Dissolve the acid and the ferric chloride in the water. Add the acetic acid shortly before applying. The hair must be thoroughly washed in order to deprive it of fat and dried before applying the dye.

White hair is said to be dyed brown by the following:

Red wine	120 grammes.
Ferrous sulphate	3 grammes.

Boil for one minute. Apply to the hair twice a week, and let it dry after every application until the desired result is obtained.

Gold Luster for China Painting.

H. M.—Dissolve 1 drachm gold in $\frac{3}{4}$ ounce aqua regia, or simply dissolve this weight of chloride of gold in water. Add 6 grains metallic tin, and enough aqua regia, if required, to dissolve it. Pour this with constant stirring into a mixture of $\frac{1}{2}$ drachm balsam of sulphur and 20 grains of oil of turpentine. As it stiffens add $\frac{1}{2}$ drachm oil of turpentine and mix. More gold gives a brighter effect; tin inclines it to a violet tinge. Balsam of sulphur is made by boiling together in a covered vessel 1 part flowers of sulphur and 4 parts oil until the mass thickens.

Teething Powders.

A. C. M.—Here are two formulas for teething powder:

- (1) Make powders each containing:
Pepsin, saccharated 5 grains.
Magnesium carbonate 1 grain.
Charcoal $\frac{1}{2}$ grain.
Lactucarium 1-6 grain.
- (2) Make powders each containing:
Mercury with chalk $\frac{1}{2}$ grain.
Magnesium carbonate, heavy 2 grains.
Rhubarb powder 2 grains.
Sugar, powder 2 grains.

One powder is to be given to a child six months old; half a powder to a younger child.

The Calculation of Profits.

J. A. K.—The percentage of profit should always be based on the selling price instead of on the cost price. The main reason for this is that the percentage expense is always calculated from the total volume of business done—in other

words, it is based on the selling price, and the percentage of profit ought to be figured in exactly the same way for purposes of comparison. The difference between the percentage of expense and the percentage of gross profit is the net profit, and the two sets of figures are so vitally important that they ought always to be calculated in exactly the same manner.

An Elixir of Creosote Carbonate Impracticable.

A. C. M. is trying to accomplish the impossible. He wants to make an elixir of:

Creosote carbonate,
Terpin hydrate,
Heroin hydrochloride,
Sodium glycerophosphate,
Calcium glycerophosphate.

This is an excellent mixture therapeutically, but a bad one pharmaceutically. A clear solution of creosote carbonate is quite impossible unless one uses a very strong alcohol, which is undesirable. An emulsion can be made. Formulas for emulsion of creosote carbonate have appeared in the BULLETIN before and can be found by consulting the annual indexes in the December issues. There was one, for instance, on page 384 of the BULLETIN for September, 1910.

To Find the Number of Carats Gold.

O. B. wants to know the jeweler's test for determining the number of carats in gold!

To find the number of carats of gold in an object, first weigh the gold and mix with seven times its weight in silver. This alloy is beaten into thin leaves, and nitric acid is added; this dissolves the silver and copper. The remainder (gold) is then fused and weighed; by comparing the first and last weights the number of carats of pure gold is found. To check repeat several times.

A Troublesome Headache Powder.

L. J. M. is experimenting with a headache powder containing acetanilide, sodium bromide, citrated caffeine, and sodium bicarbonate. He complains that he can't prevent the absorption of moisture even though he has used wax paper.

We suggest the citric acid be omitted. Otherwise the powder will cake unless it be put up in bottles. Use plain caffeine instead of citrated caffeine, and there should be no further trouble.

Vanishing Cold Cream Mentholated.

R. W. T.—In the March BULLETIN appeared a comprehensive article on the manufacture of greaseless cold cream. If you wish a mentholated preparation, select the formula that suits you best, and toward the end of the operation add one half of one-per-cent menthol.

Short Answers.

L. J. M.—A formula for a disinfectant composed of chlorides appeared in the November BULLETIN, 1910, on page 483.

C. A. N.—Two formulas for a shampoo liquid were given on page 525 of the December BULLETIN, 1910.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., JUNE, 1911.

No. 6.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	- - -	\$1.00 per year
Foreign countries,	- - -	1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.	
378 ST. PAUL STREET,	- - MONTREAL, QUE., CAN.
19 AND 20 GREAT PULTENEY STREET, W.,	LONDON, ENG.
125 YORK STREET,	- SYDNEY, N. S. W., AUSTRALIA.

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY

PREREQUISITE BILLS IN THREE STATES.

The graduation prerequisite has apparently had rather hard sledding this year. It has failed of adequate support in at least three State legislatures—Illinois, California, and Washington. It might possibly have succeeded in California but for the development of two factions among the pharmacists themselves, who seemed to be at loggerheads with one another over two or three different bills covering pharmacy and anti-narcotic matters. This situation resulted in the blocking of all legislation. In the State of Washington the Board of Pharmacy was in favor of the prerequisite requirement, but the State association was rather lukewarm, and there did not seem to be support enough to push the thing through. In Illinois, as in California, there has been

more or less misunderstanding and confusion of purpose, and criminations and recriminations have been quite frequent.

It seems that in the latter State the bill drafted by a committee of the State association was subsequently amended in several important particulars. Some people say this was done to coöperate with the State association; others say it wasn't—and there you are. Things seem to be rather mixed up in Illinois, and at the forthcoming meeting of the State association it is quite likely that the legislative situation will be discussed with a good deal of frankness and that a few hard names will be called. It is particularly difficult to find out just where the majority of sentiment lies with respect to the prerequisite idea. The State association has apparently voted in favor of it, but those who are opposed to it claim that the meeting was packed, while those on the pro side charge with equal vigor that the enemies of the graduation prerequisite are actuated by purely selfish interests. We shall see what we shall see.

The Illinois bill, as it finally passed, made but few changes in the pharmacy statute. The fee for filing an application for registration as a pharmacist was increased from five to ten dollars, and the salary of the Secretary of the Board was raised from \$2500 to \$3000. One provision makes the pharmacist the owner of the prescription by compelling him to keep all prescriptions on file for five years.

* * *

**BILL FATHERED
BY "THE WORLD."** The crusade inaugurated by the *New York World* against the druggists of that city is gradually dying out, although there are spasms of activity every few days. Once or twice a week another article appears under scare-heads, in which additional charges are made against the integrity of the calling. One of the latest developments is the introduction of a bill into the State legislature fathered by

Assemblyman Turley, and supported very strongly by the *World*.

This bill is certainly a curiosity. No prescription may be filled by a pharmacist unless it purports to have been issued by a duly licensed physician, and the physician's business address must appear thereon. When the mixture is put up, the actual dispenser must write his full name, license number, and house address on the label. The address of the physician is to be given in order that the druggist can look him up in the directory and be satisfied beyond all cavil of his existence and identity, and an elaborate record must be kept by the druggist comprising, among other things, the physician's name, his address, the name and address of the dispenser, and the ingredients prescribed.

This is such a bill as might be drawn by "reformers" who know nothing either of the practice of medicine or pharmacy. It is ridiculous on the face of it, and it means an amount of work and detail which are all but prohibitory.

* * *

SOME NEW LAWS.

Several legislative matters are worthy of brief comment this month. In Tennessee two reactionary laws have been passed creating pharmacists out of unqualified men. One of them gives to all assistant pharmacists who have spent an apprenticeship of five years full registration without taking a board examination, and the other gives the same privilege to physicians in towns under 2000 population. The pharmacists of Tennessee were evidently asleep. It will be another year or two before the situation can be remedied and then it will take some pretty hard work.

In Indiana, on the other hand, the pharmacists of the State got busy and secured the enactment of a law which prohibits, under suitable penalties, the sale of drugs and medicines within two miles of a drug store. This seems to us a very good answer for the question: "In what rural districts shall drugs be sold by unregistered dealers?" In Ohio an anti-sampling bill has been passed. This was fathered heartily by the organization of clerks known as the National Association of Pharmacologists, and the act prohibits the distribution of samples of patent medicines. Prior to the passage of this law the author of it, P. A.

Mandabach, secretary-treasurer of the N. A. P., had collected reports showing the deaths of 14 children in a period of five years from the eating of medicine samples left on door-steps and in yards.

A new poison bill has been introduced into the State legislature of New York which has apparently caused more or less worry. It is the familiar type of measure providing that all poisons must be dispensed in bottles of "peculiar shape or in bottles having a cork or stopper of such character as to apprise any person handling the same by sense of touch that the contents thereof contain poison or poisonous ingredients."

* * *

NEW POISON LAW IN MICHIGAN.

Unknown to the drug trade of the State, there was slipped through the Michigan legislature at the last minute a bill requiring that all poisons in Schedule A and Schedule B must hereafter be sold by retailers and wholesalers only in bottles having corks provided with "a wood, celluloid, glass, or metal disc, with serrated edge." The State Board of Health is to approve some particular cork and send a specimen of it to each affected dealer throughout the State. Violations of the act are punishable by a fine ranging between \$90 and \$300, or imprisonment between three months and a year, or both, at the discretion of the court—surely most severe penalties for a law of this character. The act goes into effect November 1. Who was responsible for the law no one seems to know, but, like the New York bill referred to in the previous article, it is a type of measure which makes its appearance every year in different States and for which druggists should always be on the lookout.

* * *

ADRENALIN PATENTS UPHOLD.

A decision of great importance has just been rendered upholding the validity of the patents on Adrenalin and Adrenalin Solution. The decision was rendered by Judge Hand of the United States Circuit Court for the Southern District of New York. Several years ago when Adrenalin was discovered by Dr. Jokichi Takamine, and the chemistry of the subject was given with great freedom by the Doctor to the scientific world, several manufacturing pharmacists took advantage of

the information and began the preparation of similar products, in some instances even adopting names sounding very much like Adrenalin.

Adrenalin and Adrenalin Solution, however, were protected by Dr. Takamine under process and product patents, and suit was brought first against the H. K. Mulford Co. for the manufacture of Adrin and Adrin Solution. It was this suit which has now been decided. The validity of the two product patents has been upheld, and Adrin and Adrin Solution have been declared to be infringements. An injunction will soon be issued prohibiting the Mulford people from continuing their practice of making these products.

Adrenalin and Adrenalin Solution are made by Parke, Davis & Co., who pay royalties to Dr. Takamine, the inventor. Other manufacturers who have brought out imitations of the Takamine substances are of course infringing the patents just as much as the Mulford Co., and suit will doubtless be brought against them in due time by Dr. Takamine.

* * *

DECISION IN THE A. D. S. CASE.

For the third time within a few months different judges of the United States Circuit Court have ruled that therapeutic claims do not come within the purview of the Federal food and drugs act, and that even though exaggerated in character they do not constitute "misbranding" under the law. The third and last decision rendered was that by Justice Vedder, in the United States Circuit Court for the Eastern District of New York, in a suit brought by the government against the American Druggists' Syndicate for the sale of "Peroxide Cream." Justice Vedder went so far as to declare that "by no possible construction can the terms of the act be extended to such a boundless field of inquiry as that involved in the accuracy of the remedial effects claimed for a drug." He intimated that the claims made for the product could in all probability not be substantiated, but his point was that the food and drugs act did not cover such a field of inquiry.

Incidentally one of the charges made by the government was that the A. D. S. "Peroxide Cream" contained so little actual hydrogen dioxide that the use of the term "peroxide" in the title of the product was false and mis-

leading. The Judge admitted that probably "in truth and in fact the article contained only an indication of a very small quantity of some peroxide, which said quantity is insignificant," but he asserted that no claim was made on the label as to the quantity or proportion present, and that furthermore the law did not require such a statement in the case of peroxide.

Since the foregoing was written we learn from the newspapers that the Supreme Court has just decided in the Johnson "Cancer-Cure" case that the food and drugs act cannot be held to apply to therapeutic or remedial claims. This will apparently prevent the food and drug authorities from bringing more cases against so-called "cures" and similar products on the ground that they are misbranded because not possessing the remedial virtues ascribed to them.

* * *

ADVERTISING THE STATE MEETINGS.

The secretary of a State pharmaceutical association is really the business manager of the enterprise. He ought to be possessed of the advertising instinct in order to

						
HANG THIS UP AND DON'T FORGET <small>that on the days marked you will</small> ATTEND THE MEETING <small>of the</small> Pennsylvania Pharmaceutical Association, AT BEDFORD SPRINGS, PA.						
1911	JUNE					1911
Sun.	Mon.	Tue.	Wed.	Thu.	Fri.	Sat.
				1	2	3
4	5	6	7	8	9	10
11	12	13	14	15	16	17
18	19	20	21	22	23	24
25	26	27	28	29	30	

build up the attendance—and then hold it after it has been gotten. We have been much struck to receive the small monthly calendar for June which we are reproducing in this

connection and which explains itself. It seems to us a very good idea. The original is of such size that it can be slipped conveniently into an ordinary 6½ commercial envelope and sent out with the preliminary announcements of the annual meeting.

* * *

INSTRUCTING THE DRUGGISTS.

Druggists as a class have not informed themselves any too well about the State and Federal food and drug laws. Many of them continue to be prosecuted, or at least to be warned, for more or less technical violations. Hence the wisdom and thoughtfulness of the authorities in Kentucky in arranging for a school of instruction to last ten days. This will be primarily for the benefit of the druggists of the State. It was originally intended to have the school held before this, but the date has been postponed until August. The lecturers will be made up of the food and drug officers and chemists in Kentucky, representatives from some of the manufacturing pharmaceutical houses, and several well-known pharmacists from here and there throughout the country. The State and Federal laws will be discussed with thoroughness; the important question of labeling will be gone into; the regulations will be explained; and important topics will be considered like the preparation, storage and deterioration of drug products. The whole idea strikes us as being admirable, and we hope it will be such a success that it will be duplicated in other States.

* * *

NO MORE SACCHARIN IN FOODS.

The Secretary of Agriculture has recently issued a decision forbidding the use of saccharin in foods after July 1. This decision is based on a finding of the Referee Board of Consulting Scientific Experts, and is the second finding of the Board since its creation. It will be recalled that the first one had reference to the use of sodium benzoate, and that it stirred up a controversy which is still very much alive. In that instance the Board found small quantities of sodium benzoate not to be harmful, but it declares after an investigation that this cannot be said of saccharin. Saccharin is therefore now taboo, and the decision affects more than 30 different classes of food. Some

of them most directly involved are soft drinks, sweet pickles, jellies, jams, and in some instances even beer.

* * *

CAN ANYBODY SELL H₂O₂?

The Ohio State Board of Pharmacy has decided that hydrogen peroxide is a pharmaceutical preparation and may consequently not be sold legally except by registered pharmacists. A warning will be sent out to grocers and others that if they continue handling this substance they will do so at their own peril. If we remember aright, similar action was taken in Kansas by the State Board of Pharmacy, but we recall also that a judge in New York State decided within the last year that hydrogen peroxide was not primarily a medicine and could therefore be sold practically by anybody, particularly in original packages.

* * *

A bill has been introduced in the present special session of Congress by Representative Sherley of Kentucky, the purpose of which is to impose a stamp tax on proprietary medicines like that suffered by the drug trade during the Spanish-American war. The bill apparently has little chance of passage at this session, but it is quite likely to come up for consideration at the regular session next December.

* * *

The Michigan State Pharmaceutical Association and the Michigan Pharmaceutical Travelers' Association will hold their annual meetings in Battle Creek on June 6, 7, and 8. The Post Tavern will be headquarters, and a special half-rate has been secured for all members' wives in attendance.

* * *

The Philadelphia branch of the A. Ph. A. has placed itself on record as favoring the omission of coca and other habit-forming drugs and their derivatives from the compound preparations of the U. S. P. and the N. F.

* * *

Mrs. Charles F. Weller, wife of the well-known president of the Richardson Drug Co. in Omaha, Nebraska, died very suddenly last month from a stroke of apoplexy.

EDITORIAL

PHARMACY TAKING THE BUMPS.

Since the abatement of the liquor-selling charges against druggists we had hoped that the sensationalist and muckraker would leave the drug business alone for some time to come. With the Department of Justice at Washington working overtime to stop the abuses of many of the big trusts, we had reason to feel that the newspapers might at least for awhile obtain ample matter from this source for their startling articles and glaring headlines.

But no. Comes forth the *New York World* with its editorials and articles flaying alive several hundred metropolitan pharmacists. The amount of damage done to the retail druggists of New York by the *World's* indictment, however, is largely problematical. It is notorious that men and women living in the great cities place little credence in the statements of the newspapers. In a desire for sensational material, the metropolitan dailies have so often been guilty of exaggeration that their readers now accept the most startling stories with calmness and equanimity. Distrust has taken the edge off the publisher's knife. As for faith in the papers, the readers haven't any!

But, after all, the thing that concerns us now is not the truth or falsity of the *World's* attack upon scores of New York druggists. To us the important consideration is simply this: Pharmacy is in the spot-light and the calcium rays of investigation are being turned now by government inspectors, again by reporters in quest of news, into every corner of the business, wholesale and retail. Nothing wrong can escape detection.

Even Roosevelt has a hand in the movement. Writing recently in the *Outlook* he says that the newspaper which advertises an injurious or worthless patent medicine is no better than one which sells space to promoters of fraudulent financial schemes. In either case, the victims are usually the uneducated poor who can least afford the loss.

If Roosevelt's stand is the ethical one, and no doubt it is, the anti-druggist articles in the *World* and other papers become something

of a travesty. While with one hand these journals wield the big stick upon the unshielded head of the retail pharmacist, with the other they reach an outstretched palm for the money of the medical charlatan and the quack. They blush before the misdemeanors of the retail druggist, but are not ashamed to accept the tainted cash of the manufacturer of a health belt or the distributor of a "free book for men."

Certainly the newspaper that gives publicity to an obviously worthless cure and thus develops a demand for it is culpable and morally liable. They say inconsistency is no vice. Nevertheless it tickles our risibles to see the newspapers assume the rôle of drug reformers while at the same time selling space to the manufacturer of an out-and-out fake.

In its issue of May 6, for instance, on page 5, the *World* devotes a half page to a drastic drug bill to "protect the public." But one has only to turn to page 10 of the same issue to find this loud exponent of drug reformation, this self-styled guardian and champion of the public health, give space to a "Free book for men." The advertiser who paid his good money to the *World* says, with the *World's* tacit approval: "When I resupply your nerves and blood with new vitality I take you out of the half-man class and make you strong, magnetic, full blooded, ambitious. I drive away all debility. All this I do without the use of drugs, medicines or other unnatural means. You simply use my health belt. You wear it comfortably around your waist nights; it sends a great stream of real vitality and vigor into your blood. You feel better at once; it takes the kink out of your back in one night. With special attachments it cures rheumatism, kidney, liver and stomach disorders."

Rather amusing, isn't it?

It is so easy to lay down rules for others. If the newspapers want to shout drug reformation, let them first make sure that their own advertisements do not violate the very ethics that their editorial pages so loudly proclaim.

THE STANDARD OIL DECISION.

The Supreme Court of the United States is making history these days. Its recent decision in the case of the Miles Co. against Park was of great importance to the drug

trade, but of far greater importance to the country at large was the decision in the proceedings brought by the national government against the Standard Oil Co. Everybody knows, of course, that the court ordered the Standard Oil Co. to dissolve itself into its numerous constituent organizations, and thus broke up the trust. What we desire to emphasize here, however, is the incidental position taken by the court that other suits brought against combinations may not necessarily be decided the same way; that each case will be decided on its own merits; that there are just and excusable as well as unjust and inexcusable restraints upon trade; that the Sherman act cannot be held to outlaw mere restraint upon trade itself regardless of its character and effect.

This attitude is of the greatest possible significance. Many publicists have feared for years that the Supreme Court would interpret the Sherman act narrowly; that the act would be held to prevent all sorts of trade restrictions, whether really hurtful to the public interest or not; and that an infinite amount of harm would be done to the business interests of the country. Everybody has consequently breathed a good deal easier since this decision was rendered.

We in the drug trade can surely be pardoned if we believe the Supreme Court, taking the attitude it now assumes, would have decided in favor of the drug interests in the suit brought several years ago by the national government—the suit which attacked the tripartite plan, and which resulted in the famous Indianapolis decree entered in one of the Federal circuit courts. If we remember correctly, the Circuit Court at that time held all combinations to be illegal under the Sherman act which could be shown to result in any restraint upon the freedom of trade and commerce, quite regardless of whether such combinations were in the long run for the benefit of the public or not.

The N. A. R. D. tripartite plan was a movement which emanated from the many who were weak, and which sought to prevent destruction from the few who were strong. The N. A. R. D. was simply attempting to do what the law-abiding labor unions have done so successfully. The labor union endeavors to raise wages for all. So admittedly did the N. A.

R. D. endeavor to increase earnings for all. The labor union seeks to prevent the comparatively few cut-rate "scabs" from working cheaply for selfish purposes and thus compelling the great majority of laborers to meet their prices and work for less than living wages. So did the N. A. R. D. seek to prevent the few cut-rate dealers from carrying out their purposes and compelling the whole class of druggists to sell their wares at less than living profits.

Both laborers and druggists simply attempted to prevent self-destruction. Both acted merely in self-defense. But unfortunately the N. A. R. D. and the labor union used the same weapons to achieve their necessary and just purposes that the oil and the sugar trusts have employed to achieve their unjust and censurable ends. All alike acted in concert; all "restrained trade;" and it was held at the time of the Indianapolis suit that concert of action and restraint of trade were forbidden by the Sherman law and that there was no way of legally separating the sheep from the goats.

Recognition has now come from the highest court in the land that there are trade agreements which are detrimental to society and others which are beneficial to it. Chief-Justice White strongly intimated in the decision that if the Sherman act could not be held to permit this discrimination there would be presumptive doubt of its constitutionality. We repeat that this means a great step ahead. We also repeat that under the circumstances it is more than likely that, could the Indianapolis suit have gone up to the Supreme Court, it would have been decided differently. But after all the mill can never be turned with the water that has passed.

WHITE SULPHUR IN MATCHES.

The Diamond Match Company recently did an act that speaks well for the charitable and generous character of its present management. It virtually gave up its patent rights to the use of phosphorus sesquisulphide as an ingredient in parlor matches. To make matches without this substance necessitated the use of the cheap white sulphur—a substance that conveyed a disease known as a phosphorus necrosis to the employees. The poor girls who

worked in match factories were frequently victims of this terrible affection.

President Taft interceded, with the result that the Diamond Match Company made a very generous concession, permitting its competitors to use the non-injurious form of phosphorus to which it had exclusive rights under the patent laws.

The cheaper white phosphorus that has caused so much misery among employees of the match factories is now practically a thing of the past. Its going out marks another milestone in the efforts now being made by industrial reformers to put a stop to occupational diseases. Let us hope that some day the other harmful chemicals used in manufacturing processes will be supplanted by safer products. Here is abundant room for research work. The lead poisoning of paint mixers, mercury absorption from manufacturing hats, thermometers or anything else containing quicksilver, arsenical poisoning from handling chemicals containing the metal, all tend to undermine health. It is encouraging to see Americans adopting some of the measures that have been followed in England and Germany to better the hygienic conditions of the laboring classes.

THE BULLETIN IN A NEW SUMMER SUIT.

Readers of the BULLETIN were doubtless surprised when they received this issue of the journal. The new cover appeared strange to them, and perhaps they had some little difficulty in recognizing an old friend. We say "an old friend," because we earnestly hope this is what the BULLETIN OF PHARMACY is to its readers.

How do you like the new cover anyway? We must confess that while the old one pleased us when it was adopted several years ago, we had gotten rather tired of it, and to us it suggested all too plainly the man whose once immaculate suit had gotten very glossy from wear, with sleeves and trouser bottoms somewhat frayed at the edge.

But the cover isn't the only new thing about the present issue of the BULLETIN. We have changed the shape of the page slightly—so slightly that it would probably escape detection with many people if we did not specifically call attention to it. The journal is now

a little narrower, a little longer, and has a somewhat more attractive shape. These changes are of course purely external, but we hope they reflect the more vital changes which are constantly being made in the journal itself—the new features, the wealth of illustrations, and the novel and interesting and profitable material with which we are always striving to fill our pages.

In an editorial published in the January issue we declared that we fully expected to make the BULLETIN during 1911 "a livelier, more readable, more helpful, more indispensable publication than ever." Nearly half the year has now gone, and it is not for us to say whether we have made good or not. We must stand or fall by our record. Anyway we have tried to turn out a better drug journal than ever.

A COLLECTION OF COLLEGE PROFESSORS.

In presenting the portraits of certain groups of men in the pharmaceutical world we have now reached the teachers. Perhaps we should have started out with them—but sometimes the best things are reserved for the last! At any rate, who shall gainsay the statement that these are all important men? They are the molders of character who take American youths from hither and yon and start them on the road to fame, fortune, and long hours.

Turn the next page and see our collection of professors in some of the American colleges of pharmacy. We haven't attempted to present them all—we couldn't possibly do it at one time. Some of them have already been pictured in these pages during the last few months, and others will be reserved for another time. Still others were so unnaturally shy and modest that they refused to give us their portraits even after the editor had assured them of the most tender treatment.

We recently asked a prominent board-of-pharmacy member for his portrait, and this is the reply we got: "Excuse me, Mr. Mason, but I have become so miserably ugly of late years (never was good looking) that I do not desire to put my face before the pharmaceutical public any more than I can help!" We wonder—is this a case of modesty?

Druggists Photographed in Their Stores.

4. William E. Cliffe, Philadelphia, Pa.

Members of the Alabama State Board of Pharmacy.

Reading from the left, these men are S. A. Williams of Troy, L. C. Lewis of Tuskegee, W. E. Bingham of Tuscaloosa, W. P. Thomason of Guntersville, and E. P. Galt of Selma.

W. S. Richardson, Washington, D. C.

The chairman of the Committee on National Legislation of the N. A. R. D., as he appears to our cartoonist.

This is an interior of the big store of the Central Drug Co. on State Street in Chicago. The place was equipped by the Wilmarth Show Case Company, of Grand Rapids, Mich.

Here we have an outside view of the store of J. V. Van Gilder at 5602 Broadway in New York City. We assume that Mr. Van Gilder himself is the gentleman outside.

J. H. Beise has a store in Fergus Falls, Minnesota, in which it is apparent that a large and varied stock is carried. The cigar case alone is remarkably long and well filled.

This establishment is owned and conducted by the Pecos Valley Drug Co., of Roswell, N. M. Note the surprising width of the store and the space given up to soda tables in the center.

W. A. Abbett has three stores in Duluth, Minn., and certainly this new headquarters pharmacy is a beauty! A formal opening was conducted not long since and was liberally mentioned in the local papers.

This engraving shows an interesting exterior view of the Abbett pharmacy, of which the interior is shown across the column. A razor demonstration is going on inside the window, which shows how aggressively Mr. Abbett goes after business.

"How I Spent My Vacation."

Some time ago we offered prizes for vacation stories. Several druggists responded, the following narratives being two of those accepted. While they are a little foreign to the scope of the BULLETIN, pharmacists will read them with interest. All druggists take vacations occasionally, if not every year, and a description of what some of them have done on their annual outings will, we hope, inspire others to follow their example. The first story tells us of a sea voyage from Boston to St. John. The aviation meet of the Harvard Aero Club is a feature of the journey. Then follows a delightful trip along the Atlantic Coast. There are some pictures of the St. John River in Newfoundland, showing its wonderful tide. We read, too, of the Bay of Fundy and Moncton, a quaint Canadian town that rises and falls with the tide. The second story relates a trip to Alaska. Two druggists journey from South Dakota to the Yukon. First they ride by train to Seattle and then sail north on the Pacific. Mountains rise everywhere. The travelers find health and diversion, and finally staked a mine in the land of gold.—THE EDITORS.

A SEA VOYAGE FROM BOSTON TO ST. JOHN.

By B. L. BENNETT, BRISTOL, CONN.

The first part of my trip consisted of an uneventful railroad ride to Boston. Then things commenced to happen and continued with great rapidity for the week I was away.

MEETING OF THE HARVARD AERO CLUB.

I reached Boston at the time the Harvard Aero Club were having their aviation flights in Atlantic, a suburb of Boston. There I saw Brookins, Johnstone, Curtiss and Grahame-White all in the air at the same time. These aviators were breaking world records every day. I had previously seen some flying down at the aviation field at Mineola, Long Island, also seen Hamilton fly at New Britain, Conn., but the flying done in Atlantic at this time had never been equaled, until the recent flights made at Belmont Park.

I can only say to those who have never seen an airship in the air, that they have missed a sight worth going miles to see. There is a suppressed feeling hard to describe, realizing, as one must, that he is witnessing something that has been the aim of man for thousands of years. It brings a thrill and excitement that is not soon forgotten.

THE SEA VOYAGE.

The journey to St. John really commenced the next morning at ten o'clock when the boat left Boston. We reached St. John at seven

o'clock the next morning, having been on the water over twenty hours. During a good share of this time we were out of sight of land.

I took the Eastern Steamship Co.'s boat *Calvin Austin* on a direct passage to St. John. This company maintains a fleet of large, comfortable boats. The service is good and rates reasonable. My fare for the round

The summer residence of President Taft, Beverly, Mass., passed on the trip.

trip was \$6.00; the stateroom and meals extra. The rate was somewhat reduced at this time, the middle of September.

Passing out through Boston harbor, I saw crafts of all nations. I passed forts and fortifications, went out past Nahant, Revere, Lynn, Salem, Beverly (Taft's summer home), Gloucester, Marblehead and Cape Ann with its two immense lighthouses; then we sailed out of sight of land until the next morning.

At this time of year I found the weather

delightfully cool and pleasant, the air bracing and exhilarating:

ST. JOHN AND THE FALLS.

St. John, a city of fifty thousand people, situated at the mouth of the St. John River,

In St. John, N. B.—Suspension bridge over "Reversible Falls."

is the most important and interesting city in this section of Canada. The most interesting thing to be seen is the famous "Reversible Falls." There is only one other falls like it in the world, situated somewhere in Japan.

The Reversible Falls differ from what we call falls in this country. Instead of a sheer fall of water for a number of feet, they consist of a roaring cataract of water, like Niagara, falling a distance of several hundred feet.

These falls are situated on the St. John River near its entrance into the Bay of Fundy. Here the tides rise and fall a distance of thirty feet, which accounts for the falls. When the

Suspension bridge over Reversible Falls at high tide. The water is falling over the falls in a reverse direction. It is possible for boats to pass over the falls at this time, but at no other.

tide runs out, it causes a drop of thirty feet in water level. As a result there is a big fall of water and the St. John River rushes out over these falls in a raging torrent. As the tide turns and comes in, the water backs up the St. John River, overcomes the falls and flows

up stream, so that, part of the time, the water falls in one direction, and during the other interval falls in the opposite direction. The photograph of the suspension bridge shows the water at near high tide, rushing back over the falls in the reverse direction. At this time boats can pass up the river over the falls, but at no other time. Another photograph shows an island in the St. John River near the commencement of the falls, at low tide. A glance will show the reader how the tides rise and fall on the rocks.

The tides in the Bay of Fundy are noted for their great variation. At a place called Munckton the tide rises sixty feet. It is said here that wild hogs out nosing on the beach seem to scent the turn of the tides. When that time comes, they will turn tail and run for the shore grunting and squealing as though

St. John, N.B.—The Market slip at low tide. Boats are high and dry on the sand.

Satan were after them, and in spite of their speed are often overtaken by the tide.

THE DRUG STORES.

Another photograph shows the boats in the market slip. The tide is out and the boats are high and dry on the sand. Unloading is done by driving on the sand. A few hours later tide is in, boats are high in the water; unloading is continued from the docks.

Naturally I was interested in the conditions of the drug trade and compared the conditions there and other parts of the Provinces with conditions in the States. I came home convinced that the United States was good enough for me to do business in, even with all the little restrictions we have to put up with. The Canadians seem to me to be very moderate in all they do—do not seem to have the hustle and bustle seen elsewhere.

Saloons close at five o'clock Saturday afternoons, which is a plan that might be employed to advantage in this country.

The drug stores seemed to confine their efforts to straight drug business. Evidently they have not been driven to side-lines of candy, cigars, post-cards, razors, and what not like their brethren in the States. One side-line I did notice in a prominent drug store in St. John, which interested and amused me, my attention being attracted by a sign in the window, "Marriage Licenses Issued Here." At first thought, that business would not seem to be very remunerative, but I suppose it all depends on the number desiring to wed.

But to be serious, I enjoyed the sights and the bracing air. The sea voyage was all that could be desired, and I hope in the future to take a more extended trip through the Provinces.

A TRIP TO ALASKA.

By CARL L. STANLEY, MARYSVILLE, WASH.

We started from Fulton, South Dakota, for a trip along the Pacific coast. For three days and nights we traveled on one train, finally arriving in Seattle, Washington.

After a few days' rest in this big, hustling western city we left on the *Princess Victoria*, one of the finest vessels on the Pacific coast, arriving in Victoria, B. C., May 18. It was certainly the "City Beautiful." Facing the water front was the one and a half million

Cabin at the "Little Minnie" mine, Alaska. From here the Stanleys prospected, fished, and hunted.

dollar government building made entirely of white stone. This beautiful structure was draped in purple and black for King Edward, as were all other public buildings. The maple trees surrounding these buildings were the largest and most perfect found anywhere. They must be seen to be appreciated. The population is twenty thousand, with five hundred Chinese. The Chinese pay the government five hundred dollars to get in.

SOME INTERESTING PLACES.

Dunberry Castle was a sight in itself. English laurel hedge was seen everywhere. We passed the beautiful residence of the Lieutenant-Governor. It is kept up by convict labor. Next we went out to Beacon Hill in a tally-ho. Here we found the relics of the beacon light used to light up the harbor in the days of Hudson. Beacon Hill park was a fine treat.

The Stanley party enjoying their Alaskan outing.

We found a Bobby Burns monument in the watering place and the English guide described it as "Bobby Burns on the water-wagon." In the United States he is found on Scotch whisky.

In the park we saw a large bell brought from China. Each part has a different tone. It is thousands of years old. The characters cannot be described by the Chinese of the present day. We enjoyed Swan Lake with its large white birds.

From here we went to Vancouver, a pretty place, but a bit slow. Japanese are numerous there. The weather was ideal and the trip between the coast ranges could not be improved. Snow-capped mountains were to be seen with rivulets of water flowing down their sides. Little islands along the coast—miles and miles of timber, and hunting and fishing huts and sawmills, were common sights. As we neared Queen Charlotte Sound the sea was very rough. Passengers everywhere were sick. Strange as it seems, with my knowledge of drugs I could not recommend one thing for myself to overcome the strange feeling in my stomach; so I joined the rest of the crew who were feeding the fish. We saw swordfish, hair-seals, whales, and many water-fowl.

On passing the islands, the mountains begin to loom up. They were wonderfully steep

with glacial tops. Along the sides are places where snowslides have taken place.

Our next stop was at Prince Rupert, one of the new northern towns just three years old. It has a great future. We left Prince Rupert

The writer's wife.

and proceeded up the Portland Canal, with American soil on one side and British on the other. We looked for the Stars and Stripes to be floating from Uncle Sam's mountains. Naught but the red and white of "Merry Old England" could be seen.

We reached Stewart, B. C., May 25. This town is also on the water front, being on an inlet of the Portland Canal. High mountains covered with snow greeted our eyes wherever we looked. Miners were climbing the mountains in a mad rush for gold. We left here on foot and rushed over the mountains and through forests, crossing snow fifty feet in depth. We were bound for Salmon River, where my brother had charge of a big mine. We reached there worn out and were installed in a little log-cabin belonging to the mine operators.

AN ENJOYABLE OUTING.

From here we prospected, fished and hunted. We enjoyed our first mountain goat, but it was expensive eating. When it came to our meal of bear meat we used mustard, pepper and other things too numerous to mention to kill the odor and taste, but it come out bear every time. We got water from a stream flowing from a glacier, and I wish, brothers, you could taste it. We lived there for three months, our provisions coming up on pack horses to the miners. In this way they brought us also our letters and papers.

The trip cost us just five hundred dollars. But we had rest, health, and the best time in the world.

I located some mining claims, and even though I am now rolling pills here in Washington, where I settled when I came down from the North, I have great dreams of the wealth that will come from my trip to Alaska.

THE ASSAY OF ACONITE.

By DR. A. B. STEVENS,

Professor of Pharmacy at the University of Michigan.

The pharmacopœial method has been severely criticized. The evaporation at 60° consumes much time, and when the residue is dissolved in water filtration frequently requires several hours. Both of these objections would have been avoided had the writer's method been strictly followed. The evaporation should be accomplished in a broad, flat-bottom evaporating dish, or an ordinary dinner plate will serve the purpose. Five grammes of powdered pumice stone should be added to the percolate before evaporation. This makes the

residue more porous, aids solution, and the filtration requires only a few minutes.

It has been frequently stated that the chemical assay of aconite is unreliable. The writer believes that he has previously proven this to be untrue, except in preparations of the drug that have been prepared by heat.* Statements are also made to the effect that the method is unreliable for the old or deteriorated drug, or its preparations. These statements do not

*Pharm. Arch., vol. 6, p. 49.

seem to be based so much upon experimental evidence as on the fact that, chemically, aconitine is known to split into bases naturally expected to neutralize acids; hence, to give erroneous results by titration. These conclusions are also based on the fact that gravimetric determinations are sometimes lower than the volumetric determinations. This is claimed to be due to the splitting up of the aconitine into another base of lower molecular weight. It occurred to the writer that while it is true that aconite may be split up into other bases, by chemical means, it might be possible that in the decomposition of aconitine by natural causes, as age, moisture, etc., the same agencies which decompose the aconite might also further decompose the first-formed product. In this case there might not be a very large proportion of undecomposed bases present with the aconitine, or, if present, they might be in a form insoluble in ether, and hence not materially affect the assay.

With this thought in mind, the following experiments were made. A sample of aconite which chemically assayed 0.837, and physiologically assayed 1:1200, was moistened with water, and placed in a wide-mouthed bottle. A piece of cotton moistened with chloroform was placed on the drug, the bottle carefully stoppered and allowed to stand several days. The aconite was then dried and assayed. The result, chemically, was 0.67 and 0.66; the result physiologically was 1:700.

Another sample was made quite wet, loosely covered, and allowed to stand in a warm place until covered with a dense mold that bound it together so that it could be cut with a knife. It was then dried, powdered and assayed. Results chemically, 0.301 and 0.321; physiologically, 1:450.

Several samples known to be old were next assayed. A museum sample of whole tubers in good condition, known to be at least twenty years old, assayed chemically 0.645 and 0.650; physiologically, 1:850.

A sample so badly worm-eaten that the tubers would not hold together, assayed chemically, 0.445 and 0.430; physiologically, 1:400.

Three samples of old powder, of age not definitely known, assayed:

No. 1, chemically, 0.490 and 0.485; physiologically, 1:500.

No. 2, chemically, 0.200 and 0.198; physiologically, 1:300.

No. 3, chemically, 0.542; physiologically, 1:500.

Four old fluidextracts were assayed with the following results:

No. 1, chemically, 0.316 and 0.310; physiologically, 1:400.

No. 2, chemically, 0.298 and 0.384; physiologically, 1:300.

No. 3, chemically, 0.142 and 0.139; physiologically, 1:75.

No. 4, chemically, 0.274; physiologically, 1:300.

These experiments certainly prove that the deterioration of aconite by age or moisture may be detected by chemical as well as by physiological assay.

The action of heat upon preparations of aconite cannot be better shown than by quoting from the very excellent paper on "Aconite" by F. O. Taylor (*Journ. Ind. and Eng. Chem.*, vol. 1, pp. 549-567):

"It now remains to compare the results obtained by chemical assay and by the Squibb test. A series of assays by four chemical methods are given on page 556; from these it was decided to adopt the U. S. P. method, which is practically Stevens's method, as yielding the highest percentage of aconitine. A fluidextract was selected, and this was assayed gravimetrically; the alkaloid was also titrated with N/10 sulphuric acid, and the fluid also tested by Squibb's method. A portion of the same fluid was then heated for two hours at 100° C. and assayed gravimetrically, by acid titration and by the Squibb test."

ASSAYED BY METHOD IV, WITH AND WITHOUT PREVIOUS HEATING. (F. O. TAYLOR.)

Without previous heating.			Previously heated for 2 hours at 100°.		
	Weight.	Titration.		Weight.	Titration.
1	0.551	0.438	1	0.591	0.323
2	0.455	0.438	2	0.597	0.387
3	0.714	0.426	3	0.529	0.277
4	0.468	0.413	4	0.558	0.277
5	0.479	0.490	5	0.506	0.252
6	0.439	0.477	6	0.576	0.252
7	0.469	0.477	7	0.517	0.294
8	0.468	0.490	8	0.530
9	0.505	0.456	9	0.611
Responded to Squibb test in dilution of 1:700.			10	0.664
			11	0.575
			By Squibb test gave no reaction in dilution of 1:80.		

These results disprove the assertion that the decomposition products are bases of lower molecular weight, hence give higher results by titration than by weight. The only cases in which the results by titration were higher than

those by weight were Nos. 5, 6, 7, and 8; all these were with unheated fluidextracts responding to Squibb's test in dilutions of 1:700. In every determination of the heated fluidextract the results by titration were much below those obtained by weight.

The results obtained by Mr. Taylor by titration alone are sufficient to condemn all the samples subjected to heat. If this be true, then his results prove that while the method may not be scientifically exact, *it serves the purpose for which it was intended, namely, to insure an aconite, or a preparation of aconite, of good quality for medicinal purposes.*

Determination of Ether-soluble Bases; also Chloroform-soluble Bases.—In each case the drug was extracted with a mixture of alcohol 7 volumes and water 3 volumes, evaporated, dissolved in acidulated water, the solution made alkaline, extracted with ether, again evaporated, weighed, and titrated as ether-soluble bases. After extracting with ether, the aqueous solution was extracted with chloroform, evaporated, weighed and titrated as chloroform-soluble bases. The solution from the chloroform residue, after titration, was in each case tested physiologically and found to be inactive.

	Ether-soluble bases.		Chloroform-soluble bases.	
	Weight.	Titration.	Weight.	Titration.
1	0.71	0.70	0.262	0.28
	0.72	0.715	0.245	0.28
2	0.62	0.664	0.25	0.228
	0.63	0.664	0.27	0.238
3	0.65	0.654	0.235	0.232
	0.65	0.657	0.282	0.235
4	0.382	0.38	0.09	0.128
	0.382	0.45	0.116	0.141
5	0.68	0.712	0.278	0.268
	0.612	0.64	0.256	0.257
6	0.775	0.779	0.265	0.271
7	0.68	0.712	0.28	0.271
	0.659	0.701	0.273	0.29
8	0.575	0.577	0.077	0.077
	0.58	0.59	0.096	0.077

No. 4 was an inferior worm-eaten specimen physiologically active in solution 1:300. The solution from titration of the ether-soluble residue of No. 8 was active in solution equivalent to 1:750.

The factors for aconitine were used in calculating the results by titration of the chloroform residue. This makes the results too high, as the molecular weights of aconine and

benzoylaconine are less than the molecular weight of aconitine. Doubtless there is always a small quantity of benzoylaconine, and possibly a little aconine, dissolved by the ether. This would account for the fact that, with good aconite, the results by weight are sometimes slightly higher than by titration. The character and quantity of the chloroform residue prove that a very considerable quantity of the inactive alkaloids are not dissolved by the ether, and also that chloroform should not be used in the assay of aconite.

Physiological Assay.—A tincture was prepared from aconite which assayed chemically 0.837, and when tested physiologically by the writer gave a distinct tingling sensation in a solution of 1:1200. The tincture was then tested upon 12 persons, each of whom was familiar with the taste of aconite. Six were sensitive to dilutions of 1:1200. Two were sensitive to dilutions of 1:900. One was sensitive to 1:800, and afterward thought he could detect it in 1:900. Another was sensitive to 1:600. Two others were unaffected by 1:150, but thought they were by 1:100. Some were found to be more sensitive at one time than at another.

This proves that the method cannot be relied upon for quantitative assay. When used by those who are known to be *sensitive*, it is a good method to determine whether the drug or its preparations are medicinally active or not.

CONCLUSIONS.

1. That aconite properly kept does not deteriorate.

2. That when deterioration takes place through improper care such deterioration may be detected by chemical assay.

3. That when deterioration is due to heat the weight of ether-soluble residue is increased, the basic properties decreased, hence the deterioration is easily detected by volumetric assay.

4. That the Squibb test is valuable for comparison, but is not suitable for pharmacopœial standardization to be used by different individuals.

5. That chloroform should not be used in the assay of aconite.

6. That the chemical assay is not scientifically exact, but is sufficiently accurate to be used in determining the quality of aconite or its preparations.

"MY BEST PAYING SIDE-LINE."

Brushes of All Kinds—Trimming the Window with Them to the Best Advantage—Conducting Special Sales—What a Good Display of Brushes Will Accomplish in Itself.

By CHARLES W. HOLZHAUER,
Newark, N. J.

Next to our soda fountain, which we hardly consider a side-line, the sale of bristle goods—hair, tooth, nail and other brushes—pays us best. To these articles we devote about ten feet of counter space in the most prominent

A hair-brush window showing the large brush as the central feature.

part of the store where all customers who enter must see them.

To stimulate the sale of these goods we conduct special sales at regular intervals, making a low price on them for the time of the sale, and giving good value for the money. When we are running a special sale, we devote extra display space in the store to the goods, use special signs calling attention to them, make an attractive window display, and often, in connection with all this, use newspaper space dwelling on the special opportunity offered for purchasing some of the articles. Such sales yield a net profit of 25 per cent.

THE WINDOW A VALUABLE ASSET.

We most decidedly use our window to push the goods, considering it the best advertising asset we have. In making window displays of tooth and hand brushes, because the articles themselves are comparatively small, we use specially made large brushes which are exact duplicates of the small ones, and these are

featured as the central part of each display. This idea we originally obtained from the book of "Window Displays for Druggists," published by E. G. Swift, Detroit, Michigan. The large brushes are easily made, and their cost will not exceed four or five dollars each, and they can be used for a long period. We made ours in the following way:

Have a wood-turning concern make a back for the brush of wood in exact proportions, about six feet long, or any suitable length according to the window in which it is to be used, the under side of which is drilled full of holes to receive the bristles. Stain this back any suitable color; for a tooth-brush, white enamel will be best; for a hair or hand brush, mahogany stain looks well. Now having the back ready, secure from a brush factory sufficient tampico fiber to fill up the holes. Separate this into little bunches and set each tuft

This display we ran in January. As all the department stores were conducting sales in white goods after the holidays, we called ours a "White Tooth Brush Sale."

into the holes with plaster of Paris or glue. The brush will then be ready for use.

Hang it in the center of the window, where every passer-by will see it—even people across the street—and will know that you are offering brushes for sale. It is an easy matter to fill in the rest of the window with piles of brushes

arranged in various forms or loosely stacked up. A large number of brushes to give the impression of quantity also helps the appearance of the display. Large signs on the glass of the window, and some smaller reading placards on the floor of the window, will about complete the arrangement.

SOME NOVEL FEATURES.

In conducting these sales we have endeavored to give exceedingly good value, and to introduce some novel or unusual feature in them. We have for several years successfully run tooth-brush sales along this idea, "Two Tooth-brushes for 25 cents," and it has proved a winner. We made no mention of the price of a single brush, and among the large num-

An enlarged comb displayed in the window during our comb sale.

ber that we disposed of, very few single brushes were sold. Nearly every one took two for 25 cents.

In buying for these sales we try to get as close to the manufacturer as possible, so that we can get the very best price, and may be able to offer the goods at a low price and still make a profit. Very often we are able to pick up job lots of good brushes at a price which gives a nice assortment for the sale. Quite recently we purchased a trunk line of hair-brushes, 250 brushes in all. We cleaned up those that were soiled, put our large brush in the window, made the prices attractive, and in a week's time sold over half our purchase. This was a particularly desirable lot because nearly every brush was different, which gave the customer a large assortment to choose from.

At another time we bought a quantity of domestic hair-brushes from the factory at \$21

a gross. These were exceptionally good value, and would retail in the regular way at 35 cents. We ran these as a special for 25 cents, and sold out all by a week's window display.

Sanitary Hair Brushes Special

25c

Worth up to \$1

Think of a pure bristle, solid back, sanitary Hair Brush for only 25c. They'll stand water, too. Many in the lot are regular \$1 brushes. They're being snapped up like hot cakes.

We carry a wide assortment of Hair Brushes at prices ranging up to \$5.

Values up to \$1

These are pure bristle sanitary brushes, with solid backs. Water will not affect them. Many brushes in the lot have sold as high as \$1. Your choice at 25c.

OUR LINE OF HAIR BRUSHES

is unusual in assortment and pleasing in quality. A wide range of prices up to \$5.

HOLZHAUER'S
Broad and Market Streets

These ads. were run in the newspaper while the hair brushes were on display in the store window.

We conduct these sales regularly, about one bristle goods display at least every two months, and people have come to look for them. The summer months we find are best for scrubs, while the others are staple almost any time of the year.

BRUSH SALES.

As a result of these sales our trade in brushes has been wonderfully increased not only for the cheaper goods, but we have found that people will also purchase higher priced

HAIR BRUSH SPECIAL

25c

up to \$1

The Last Week

This Special Sale of Hair Brushes at 25c. is making all Newark talk. There are many \$1 Brushes in the lot.

They're sanitary brushes. All pure bristle, with solid backs. Water won't hurt them.

There's a wide choice of other Hair Brushes here at prices ranging up to \$5.

HOLZHAUER'S
Broad and Market Streets

Another ad. run in the paper during the hair-brush sale.

brushes when their merit is explained. It is essential and helpful that the man who is selling bristle goods be posted himself about their quality and the different methods of manufacture, so that he can talk intelligently to his customer on these points. We feel confident

that if any one will devote a little time and thought to the sale of bristle goods in his store, he will be amply repaid, and will regain a part at least of the business which was once wholly handled by the drug trade, but which has of late drifted to the department store.

STROPHANTHUS.*

By JOHN URI LLOYD, PHAR.M.

The genus *Strophanthus*, which produces this drug, is chiefly African, belonging to the Apocynaceæ and the tribe Echitideæ of this order, distinguished from the other tribes of the order chiefly from having the anthers united after the manner of the Asclepiadaceæ. Index Kewensis mentions several species, Bentham and Hooker eighteen species, Pax twenty-five species, and the genus is being rapidly augmented as the flora of Africa becomes better known. Plants of the genus have usually woody stems, emitting a milky juice when wounded, and are generally twining vines. The seed of commerce is probably collected from various species indiscriminately, which have been classified and differentiated by Pax, Planchon, Hartwich, Holmes, Blondel, and others.

Strophanthus hispidus D. C. was one of four species described by De Candolle as early as 1802, and is the species to which the drug was first ascribed. Its habitat is Senegambia and Guinea and other parts of Western Africa. The stem is a twining, milky shrub, with opposite hirsute leaves. (Hence the name *hispidus*, Latin for bristly, hairy.) The seed, which bears a slender style terminating in a plumose pappus consisting of long hairs,† is the part used in medicine.

*Bulletin No. 18 (Pharmacy Series No. 4) will give a brief history of every vegetable drug of the Pharmacopeia of the United States, 1900 edition. This Bulletin, like other Lloyd Library publications, is not in general circulation, nor is it sold commercially, being designed solely for exchanging for the publications of Societies and Academies of Science. Extra copies will be printed for those who, before May 15, enclose one dollar to "The Lloyd Library," Cincinnati, Ohio.

†Hartwich calls special attention to the fact that the hairs of *strophanthus* seed are very sensitive to moisture, spreading horizontally in dry air, and becoming erect in moist atmosphere. He suggests that the pappus would thus make a hygrometer sufficiently sensitive for practical purposes.

As stated before, the genus *Strophanthus* was established by De Candolle as far back as the year 1802. It was not until the early sixties, however, that the drug came to the general notice of Europeans as being one of the arrow poisons used among the African native tribes, there being two kinds of arrow poisons derived from this source. A poison was prepared on the west coast of Africa (Senegambia, Guinea, and Gaboon), called *inee* or *onaye*, which is derived from *Strophanthus hispidus* D. C. This is on the authority of Hendlot, who observed the plant yielding this poison in Senegambia at the River Nunez. A specimen of this arrow poison was sent to Europe and investigated by Pelikan in 1865. (*Comptes Rendus*, 1865, vol. 60, p. 1209.)

On the east coast of Africa, the *kombe* or *gombe* poison was in use in the Maganjah tribe, located near Lake Nyassa on the banks of the river Shire, a tributary of the Zambesi River. Consul Kirk in Zanzibar, in 1861, established that this poison originated from a *strophanthus* species, and forwarded specimens to Professor Sharpey in England for the purpose of investigation. Subsequently, in 1865, Livingstone's famous reports brought the *kombe* poison to a more general notice among the Europeans.

This species of *strophanthus* was at first considered identical with *S. hispidus* D. C., but the plant was shown by Oliver in 1885 to be distinct from the latter, and this justified the establishing of a new species, *Strophanthus kombe*.

The physiological features of the drug as a powerful cardiac were recognized by the first investigators (Sharpey, 1862; Pelikan, 1865; Fraser, 1871). Livingstone reports the observation of Consul Kirk that the poison remarkably reduced the pulse, but the drug was not authoritatively recognized by the medical pro-

fession until about the year 1885. In this connection it is interesting to note that in Somaliland, Africa, in order to establish the virulence of the poison, the native scrapes the skin from his own arm until the blood flows, when he applies the poison to the lower end of the bloody pool and watches the coagulat-

ing effect, from below upward. To the firm of Burroughs, Wellcome & Co., London, is largely due the position that *Strophanthus* occupies in the medical lore of the present day, this being due chiefly to the efforts of Mr. Henry S. Wellcome, through his friend, Henry M. Stanley, the African explorer.

CATCHING TRADE AT SUMMER RESORTS.

Running a Drug Store on the Great Board-walk in Atlantic City—How to Treat the Summer Girl—Hotel Patronage Presents a Peculiar Condition—The Lines that Pay at a Watering Place.

By F. G. RENBE.

After completing my college education in the oldest and best college of pharmacy in the land I set out to hunt a position. I chose Atlantic City because I thought the ocean breezes and salt air would be just the climatic condition for a young college "grad" after passing through the strenuous ordeals commonly known as senior "exams" and graduation week festivities. I was determined to land the first position in the first store I came to, and I did. I started in to do my turns in a live apothecary shop on the "great wooden way."

Our store was of the summer type that is delicately built, facing the ocean, mounted on driven spiles sufficiently high to escape the rush of angry waters at high tide.

IN A FASHIONABLE DISTRICT.

We were located in the most fashionable part of Atlantic City, namely Chelsea. The people who made up the summer colony were mostly society people of old Philadelphia.

The proprietor was a married man, strikingly handsome, who had a very good standing among the summer colonists. He was right there when it came to evening parties, and his wife, a charming type of pulchritude, was a very prominent figure in Chelsea social life. Our class of trade required unusual care on account of the very sensitiveness of these society folk. I learned it from the proprietor once, and I was equal to the occasion ever afterward.

Even the maids, who do considerable shopping, require careful attention. Kindness and little favors go a great way in bringing them back. It was our general policy to push them

to the limit on prices. We had to do it or we wouldn't have been able to carry away any clothes when the October blasts began to blow.

Our season extended from April 15th to October 1st; but we could only count upon six weeks of real business, extending from July 4th to August 20th. During the real busy season we could use six clerks besides ourselves, but clerks trained in handling Atlantic City trade at that time were not to be had for love or money. We had to handle the trade as best we could and content ourselves with that. Our six weeks' business which we counted on depended largely upon the weather. Of course, if weather conditions were perfect, everybody was happy, but when the thunder clouds came and Jupiter Pluvius poured out his flow of H_2O , many were the mourners and the druggists were not exempt. All suffered alike.

Long before the season started it was amusing to hear some of the old fellows get together and tell how much behind they were compared to the same time last year. But in my two years there, all ended well.

WHERE THE MONEY LIES.

Stationery, candies, prescriptions, cigars and toilet goods are the profit-makers. To keep summer trade, one must be courteous. Courtesy pays big dividends. Summer visitors come with money to spend. To induce them to buy you must treat them right and the money part will take care of itself. We found that low prices on advertised goods like patents paid well.

The trade would not stand for exorbitant prices on well-known goods, but paid us a

handsome profit on stationery, brushes, candies, and prescriptions. Suggestion brought many extra sales. With a tooth-brush we sold a dentifrice, and so on until we realized a nice sale with every buyer.

Summer visitors do a great deal of writing, telling their friends back home what a good time they are having even though they may be spending it not so lively.

We kept a splendid line of papeteries and got excellent prices with little or no comment. Our prescription trade netted us handsome profits. We were rushed continually and used the double-check system, which moved considerable worry from our shoulders. The prescriptions called mostly for calomel, sodium bicarbonate, and pepsin preparations. Indigestion remedies were in demand.

One of our most profitable side-lines was confectionery. We handled candy exclusively in box form. We sold considerable of the half-pound and pound boxes retailing at 40 and 80 cents respectively. Our good candies brought good trade, and good trade spent money for other things which helped us to live to tell the story.

HOTEL TRADE A GRAFT GAME.

At the beginning of the season every bell-

hop of the large hotels scours the city apothecary shops looking for discounts paid for goods obtained there. We didn't enter this kind of a game simply because we felt it paid to cater squarely to visiting trade. They were dealt with more fairly when they came to the store personally and besides received a touch of our courteous treatment. Goods delivered at the hotels, on the other hand, were re-priced to pay for the bellhops' trouble. The drug store sending such overpriced goods, of course, was blamed for overcharging and thus trade was lost.

HOW WE HANDLED THE SUMMER GIRL.

We found after a little study that it paid us good dividends to treat the summer girl ever so nice. She purchased toilet goods, stationery, drug needs, and found our courteous treatment just to her liking. She brought her admirers into our store to buy bon bons and sundaes. This gave us an opportunity of again extending our good treatment, which came back to us in tobacco trade and other incidentals. There is only one way to a successful season and that is a most courteous treatment at all times. It pays big dividends.

A CLOSE CALL.

A Druggist Swallows a Deadly Photographic Mixture, Momentarily Mistaking It for Brandy and Soda—His Own Presence of Mind and Quick Work by the Doctor are all That Save Him—A True Story.

**By ERNEST C. CRIPPS,
Berkhamsted, England.**

The smoking-room was full to overflowing that night, for the Royal Hotel was the headquarters of the British Pharmaceutical Conference, which was holding its meetings at Oxbridge. Many well-known Knights of the Pestle sat around, and each had contributed his story of experience, usually of the "shop," for the general good, except one, and it was now his turn to talk.

"Well, friends," he commenced, "I have been much interested in your yarns, especially those about mistakes in dispensing. But these mostly concerned other people. I want to give you an experience which very intimately concerned myself." He paused to moisten his

throat, and giving a few vigorous puffs at his cigar, continued:

MIXED DRINKS.

"I don't suppose any of you have been as near death as I have, and although the thing happened quite twenty-five years ago, I cannot recall it even now without a shudder.

"The younger ones here who are so used to using the dry plate in photography can have no idea of the old 'wet plate' process; but it was whilst developing one of these that I made an almost fatal mistake.

"It was on a hot July night in the year 1885 that I went down into my dark room, which

was in the cellar, to develop a plate I had taken late in the afternoon. For the benefit of those who do not know how these plates were prepared and developed I may say that a piece of glass was first covered with collodion in which were dissolved the iodides of various metals. It was then passed through a nitrate of silver bath, the iodides forming sensitive silver salts, upon which the light acted as in the modern dry plate.

"The developer was an acid solution of iron sulphate, and the fixer a mixture of cyanide of potassium and water.

"I have told you 'twas a hot night, and I took down with me a glass of—well, whisky and soda. This I stood by the side of my dishes, in company with the measures containing the developing and fixing solutions.

"Lighting my lamp, lit by gas, I commenced my work. The plate had been underexposed and needed a somewhat prolonged development. It was while I was rocking vigorously that I mechanically put out my hand for my glass of drink and took a hearty pull at what I supposed was whisky and water.

"But the first mouthful convinced me that I had made a mistake, for I had taken the fixing solution which was in a measure similar to the beverage in the tumbler.

"It flashed through my mind as I spat out what I could of the poison that I had still taken sufficient to cause death, and that in all probability I should not be able to get upstairs for help before loss of consciousness came on.

QUICK WORK.

"At such times one's brain works with lightning-like rapidity, and mine did then. Fortunately—I recommend all you young fellows here to do likewise—I had learned by heart all the antidotes required for the different poisons, and I knew the only thing to help me in that direction was some fresh ferric hydrate.

"But how could I get it? I had by this time thrown open my dark-room lamp, and by its rays I looked wildly round the small chamber. Nothing I saw was of use! And then my eyes rested on the developing solution, and I knew if I had an alkali I might yet win through.

"By this time my breath was coming in quick, hard pants, and a feeling of giddiness

was beginning to overpower me. Just then I spied a bottle of liquid ammonia in a corner. In far less time than it takes to tell it, I had poured it into the dish and had taken as much as the contracted condition of my throat would allow.

"And then I tried to get out of the cellar for help, but before doing so it occurred to my fast clouding mind that I should very likely be speechless and perhaps insensible long before I got up the steps, and any one discovering me would not know what was the matter and thus valuable time would be wasted. Tearing a piece of paper from my pocketbook, I wrote these four words upon it—I couldn't for the life of me do more: 'Cyanide, mistake. Taken antidote;' and with this in my hand I made for the stairs.

"You must understand that although it has taken me perhaps five minutes to *tell* you all this, all my actions were crowded into a few seconds, and when I arrived at the foot of the stairs not more than half a minute had elapsed since I took the dose.

THE CYANIDE POISONING.

"But already a great change had come over me. I had almost lost the use of my limbs and staggered like a drunken man. It was becoming more difficult to get my breath and occasionally convulsions shook me. But through it all my will remained dominant and I forced my tottering legs up the steps.

"It seemed centuries before I reached the top. Even now in my dreams I sometimes live over again that struggle in all its horror. Each step seemed like a mountain and when one had been surmounted another arose, apparently higher than the preceding. But it came to an end at last and I fell insensible through the doorway into the kitchen."

The narrator paused for breath and rest, for the memory of the incident had evidently unnerved him. Drops of perspiration stood on his forehead and his hand shook. The listeners gazed eagerly at him, waiting for the finish of the story.

COMING TO.

"When I regained consciousness I was lying on the kitchen floor, my clothes soaked in water, and a doctor was rinsing out a stomach tube.

"'Near squeak, you've had,' he said, 'Your girl caught me just in time.'

"What's happened?" I feebly asked.

"Well, you fell in through the door insensible and you may thank your lucky stars your servant's got brains. She was sitting here and instead of rushing around and screaming, she saw the paper in your hand and read it.

"She then ran round to my place and by great good luck found me just going out. The rest of the story you can imagine. But I can tell you one thing: if you hadn't taken that

iron mixture I don't think I could have brought you round.'

"All's well that ends well," continued the narrator, "but you can easily imagine how, even twenty-five years after the event, I am still affected by the smell of cyanide or prussic acid."

And the smoke grew thicker as the members of the party silently meditated upon the fact that truth is sometimes stranger than fiction.

AN ARTISTIC MAGAZINE WINDOW.

By J. EARL TAYLOR, Ph.G.,
Gridley, Illinois.

This is one of the trims I used to boost magazine sales. Once a month we give space to periodicals in this window. The profits are not so very large, but the indirect sales boost the Magazine Department to a satisfactory

The June bride whose picture appears throughout the display is very much in harmony with the things about her.

This trim is about 5 feet deep and makes a strong, clear-cut display for the far and near

position. This trim is an appropriate one for May or June—clean, neat, dainty.

The lattice-work is in white. The background body is in red, giving a clear contrast. The flowers to be used in and about the display may be changed as the season demands.

observer. It is so plain and simple in construction that it calls for no special description.

This particular window was intended, of course, to exhibit the *Ladies' Home Journal*, which is one of our best sellers.

BOARD QUESTIONS ANSWERED

AN ILLINOIS EXAMINATION.

PHARMACY.

(Continued from May BULLETIN.)

18. What is the original source of ichthyol?
(a) Why should ichthyol not be used in connection with an acid? (b) In what is it soluble?

A crude oil, ichthyol oil, resulting from the destructive distillation of a bituminous rock filled with fossil fish and found in large quantities in the Tyrol Mountains of Europe. (a) Acids combine with the ammonia and precipitate the ichthyolsulphonic acids as a dark resinous mass which adheres to the sides of the vessel, unless the acid be quite dilute. (b) Water, or a mixture of equal volumes of alcohol and ether.

19. Give the commercial or trade names of the following: (a) Acetphenetidín; (b) Phenyl Salicylate; (c) Hexamethylenamine; (d) Benzosulphinide; (e) Methyl Salicylate.

(a) Phenacetin; (b) salol; (c) urotropin; (d) saccharin; (e) oil of wintergreen.

20. How much absolute hydrocyanic acid is contained in 100 minims of U. S. P. Acidum Hydrocyanicum Dilutum? (a) What precautions are recommended for its preservation?

Assuming the specific gravity is same as water, 100 minims would weigh 95 grains, $95 \times .02 = 1.8$ grains. (a) It should be kept in small, dark amber-colored, cork-stoppered vials in a cool place.

PRESCRIPTIONS.

No. 1501. *FOR MISS WHITE.*

℞ Magnesii sulphatis,
Plumbi acetatis.....ää 15 Gm.

M. ft. pulv. in scat. exhib.

Signa: External use only.

Aug. 10, 1907.

DR. BLANK.

If dissolved in water the ingredients react, forming an insoluble lead sulphate.

No. 1502. *FOR MISS BLOCK.*

℞ Ferri sulph.3ss.
Potassii carb.gr. xviii.

M. ft. pil. No. xii.

Signa: One p. c.

Aug. 2, 1908.

DR. PRICE.

Follow the official method for making pills

of ferrous carbonate. Rub up the ferrous carbonate with a sufficient quantity of glycerin and water, then add the ferrous sulphate and sugar, previously triturated together to a uniform powder, and rub the mass thoroughly till it assumes a greenish hue. When the reaction has terminated, incorporate tragacanth and althæa, and, if necessary, add a little more water, so as to obtain a mass of pillular consistency. Divide this into 12 pills.

No. 1503.

FOR MISS BROWN.

℞ Hydrargyri oxidi flavi.....gr. xx.

Ungu. zinci oxidi ad.....3ss.

M. ft. ungu.

Sig.: For external use.

Aug. 3, 1907.

DR. BLANK.

Rub up the yellow oxide of mercury very thoroughly with a little of the zinc oxide ointment till perfectly smooth and then incorporate the rest of the zinc ointment. Rub the two ointments together until the white and yellow colors of the two ointments blend into one.

No. 1601.

FOR MISS BLAKE.

℞ Olei cinnamomi..... 0.25

Sacchari 2.50

Zingiberis 1.25

M. ft. pulv. in Chartulæ V div.

S.: One c. a.

Aug. 31, 1907.

DR. B. LAKE.

Mix the oil of cinnamon with the sugar and then with the ginger. Dispense in wax papers to prevent evaporation of the volatile oil.

No. 1602.

FOR MR. WHITE.

℞ Sodii bicarb.,

Pulv. aloes.....ää gr. v.

M. ft. capsulæ tal. No. V.

S.: One h. s.

Sept. 1, 1907.

DR. BLANK.

This mixture will darken, giving a reddish-brown mixture, but can be dispensed. Be sure to have five grains of the mixture in each capsule.

No. 1801.

FOR MR. FRANCIS.

℞ Hydrarg. chlor. corros.....0.16 gramme.

Ammonii chlor.3.20 grammes.

M. ft. pil. 15.

S.: Doctor will give directions.

Nov. 1, 1908.

DR. BLACK.

Use glucose, syrup, and wheat flour as excipients.

(To be continued.)

LETTERS

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

ANOTHER VACATION IDEA.

To the Editors:

I see you are going to publish some articles* describing the way druggists spend their vacations. I enclose three small photographs which I took last summer at "Camp Lanac," on Sycamore Island, Maryland—up the Potomac River about eight miles above Washington.

This camp was composed of five young men from my neighborhood in Washington. They

Mr. Fuhrmann and his family at "Camp Lanac" on Sycamore Island in the Potomac river near Washington.

had two large, square tents on an elevated platform with a porch awning extending across the front of both, making them very dry, comfortable, and convenient. These were used for sleeping quarters, while a third tent was utilized as a kitchen and a storeroom for provisions.

The young men were employed in the city during the day and went out to camp every evening after work. A trolley line running near-by made it convenient to the city. This gave them plenty of outdoor air and sport on evenings and Sundays, and still did not interfere with their employment. They did their

*Two appear elsewhere in this issue of the BULLETIN.—THE EDITORS.

own cooking. Canoeing, fishing, and bathing are good at this place. They spent five months, from May to October, in this way at very little expense. Sundays they entertained large numbers of their friends, as one

A group of visitors at the camp.

of the pictures will show. The Fuhrmanns were "among those present" on one occasion. The picture of the Fuhrmann family shows that they are no small crowd by themselves. A very enjoyable day was had with our friends, and we thought this a very unique way of spending the summer.

Of course many druggists do not have their business sufficiently well organized to permit them to be away so much, but I thought the

After dinner everybody turned in and helped scour the pots and pans!

plan might suggest ideas to others that would work out well for them.

The day being cloudy, the pictures do not show up very clearly.

Washington, D. C. CHAS. J. FUHRMANN.

A CLEVER RUSE.

To the Editors:

Druggists in the United States are not the only ones who are occasionally the victims of "sharpers." In Sydney recently a great many members of the trade have been caught napping by a trick played on them by a very clever rascal. Apparently he is a morphine subject. He proceeds in the following way: He first secures a four-ounce bottle of Collis Brown's Chlorodyne. Having emptied it, being very careful not to damage the wrapper or seal, he refills it with water, replacing the wrapper and seal very carefully.

With the package up his sleeve, he enters the pharmacy and asks for a four-ounce bottle of chlorodyne. When it is handed him, he inquires the price, appears to hesitate whether he will take it, and then asks about something else, possibly a doctor's telephone number, or address, or some other question which will distract the attention of the druggist. He then does the quick-change act, placing on the counter, or show-case, the bottle which he has filled with water, slipping the druggist's property into his pocket.

By the time the druggist has come back to renew his conversation, he has made the change. Having obtained what he wants, he makes some excuse for not taking the bottle, or perhaps says he will take it, but must go out and get the money for it, or asks that it be wrapped up, and he will call again for it. He then makes his exit, and that is the last seen of him. In some instances he has been so quick that it has only been necessary for him to have the druggist look out of the door, or turn around. After this smooth gentleman leaves the store, the pharmacist naturally either wraps the package or puts it back on the shelf. If the former, when it is not called for in a reasonable time, it is unwrapped, and put back into stock. The druggist does not know he has been victimized until some one to whom he has sold the bottle containing the water brings it back and abuses him.

This may be an old trick in America, but it is a new one in Sydney, and strange to say has been practiced on a great many druggists here. One can imagine the disgust of the purchaser of the watered bottle when he wishes to use the chlorodyne, and finds nothing in it but water. In some cases it has taken a lot of

talk to convince the buyer that it was not the druggist who did the substituting.

Possibly this may be of interest to your readers, and the trick may be new to a great many of them. Having been in business myself in America for about forty years, and not having come across this trick, I believe it will be a new one on some. JNO. H. ALLEN.

Sydney, Australia.

SOME BODEMANNIAN REMINISCENCES.

To the Editors:

When you get to be three score and over (like me!) you will indulge in reminiscences (like me). You have had more or less in the BULLETIN during the last two or three months about tinct. ferri pomat. I have looked up that first contribution of mine to the technical press in 1863. This product enjoyed quite a run at that time as a mild iron preparation. The old way of making it took about six months. My preceptor (a grand old man indeed if he was not a Ph.G.) made me experiment with the berries of *Sorbus aucuparia*, which are rich in malic acid. Then, instead of soaking the metallic iron in the malic juice, the foxy old fellow made me dissolve freshly prepared ferric hydrate in the juice—and the trick was done in as many hours as it had taken months before!

As I have intimated, my preceptor was a practical, self-educated man, and he was full of the milk of human kindness. The German apprentice is cooped up in the den without any time off except every other Sunday. He sleeps, eats and works in the same house—no breath of air—no let up. Contrary to this, however, when summer came along our boss chased us out, right after the midday dinner, about once a week. His instructions would be: "Go into the woods, boys, pick up flowers and plants, and have a good time. Call on Farmer Butterschmidt, who deals with us, show him some attention, and he will set up fresh eggs and butter as a lunch for you."

The next day we had to classify the plants gathered. Botany, the nightmare, was made easy and pleasant!

As a general thing the German apprentice in 1863 received no salary. He got his food and his lodging as a reward for his hard work. My case was an exception. I got 50

thalers for the four years because Bremerhaven was full of confederate vessels during the blockade, and because I had picked up enough English in my Hamburg school to take care of that trade.

Chicago, Ill.

WILHELM BODEMANN.

ADVERTISING SCHEMES: WHAT KIND PAY?

To the Editors:

Does advertising pay? I mean strictly ethical advertising, where no special price inducements are offered.

I submit several sample ads. which were

<p>Drug Talks</p> <p>YOU cannot tell by looking at the bottle whether your prescription has been correctly compounded or not.</p> <p>CONFIDENCE in the DISPENSER is what you must rely upon. in their behalf. The seed seems to have fallen on barren soil.

For years I used to run ads. in church di-

rectories, programmes, etc., calling attention to the fact that "no liquors were sold in my store," and although I was about the only druggist who could claim that distinction in this city, no preacher ever congratulated me upon that point. The only way to reach the public's heart is through its pocketbook. If you have any special inducements to offer, advertise. If you haven't, *don't*.

Kansas City, Kansas.

J. W. GIESBURG.

LAST WILL AND TESTAMENT OF THE GROUCHY DRUGGIST.

To the Editors:

Now that the new school of preventive medicine has announced the millennium of drugless therapy, I, who in the course of centuries have grown old and decrepit in the service of suffering humanity, have seen fit to make my last will and testament as I am about to depart from the scenes of professional activity.

To Father Time I bequeath all of the long hours spent in the daily routine, from mornings at seven o'clock until ten o'clock at night, year in, year out, without vacation, including Sundays and holidays; also the hours snatched from sleep when responding to the night-bell in order to accommodate the sport who felt in need of a bromo-seltzer after a night's revelry.

To the Postmaster-General of the United States I bequeath all the profits made during a long lifetime on the sale of postage stamps, in order that he may avoid another deficit at the end of the present fiscal year without making wealthy manufacturers and jobbers pay advanced rates on the advertising pages of their house organs; for I am firmly of the belief that these advertising pages not infrequently are the best part of the issues to which they are attached, and hence should be protected like all special interests.

To the aspirants to other callings I bequeath all the liberal education which I have always begrudged my own apprentices for fear that they might learn to love their calling rather than sweep the store, or dress show windows and wash bottles, or do such other menial service for which most people engage porters or "scrub ladies."

To the future student of pharmacy I be-

queath the study, for the mere love of study and truth, of all of the intricate problems of structural chemistry, such as that of the quinine molecule, so long sought after by the research chemists of the "Farbenfabriken" of the fatherland, but not found so long as this discovery might have served a useful purpose.

And lastly, to my successor, the pharmacist of the future, I bequeath all the scientific and professional longings which I never knew, and for which I never had any use whatsoever, knowing full well that his idealism will avail him no more in the battle of life than my pessimism has availed me.

PHARMAKOPHILOS.

PERMITS TO PRACTICE PHARMACY SHOULD BE DISPLAYED.

To the Editors:

The following short communication was read by the writer at a meeting on April 25 of the Executive Board and Publicity Committee of the National Association of Pharmacologists in Columbus, Ohio. If you care to publish it in the BULLETIN we should be glad to have you do so:

Some of the pharmacists and their clerks are sadly negligent in the matter of complying strictly with that portion of the law that pertains to the exposing of certificates issued by the Pharmacy Board. Hence, I make no apology for addressing my fellow members and officers of the National Association of Pharmacologists on this subject.

The law regulating the practice of pharmacy was enacted, first, for the safety of those needing drugs and medicines; and secondly, for the welfare of the pharmacists themselves. Every well-meaning registered pharmacist, whether possessing a "master's" or "assistant's" paper, should post his license in a conspicuous place.

He owes it to his customers, and he owes it to himself—to the former for *their* protection, and to himself for *his* protection. To prove the value of the certificate when exhibited, I will cite an actual occurrence that came under my observation some years ago.

I was clerking in a store in which all certificates were given such a prominent location

that they could not escape the notice of our patrons. One day a lady came into the store to have a prescription filled; and as she handed the order for medicine to one of the clerks, she remarked: "We have a drug store near our home, but we do not let our druggist compound our prescriptions as he has no license displayed."

Subsequently I learned that this pharmacist employed only cheap, unregistered help. Perhaps that was why he withheld his certificate from public view. If that be the case, he deceived no one but himself.

The public is well aware of the existence of the pharmacy law, and they have a perfect right to know whether or not the person serving them has complied therewith.

Columbus, O.

CHAS. H. BOWERSOX.

MARKING PRESCRIPTIONS.

To the Editors:

It seems to me that the druggists are very careless about marking prescriptions when they give their customers a copy. I find that out of the many prescriptions I get, several are copies of the original given by druggists to their customers. People come from all parts of the country, and when one of these prescriptions is presented to be filled without an N. A. R. D. mark on it, a person is in doubt about the price formerly charged.

Fellow druggists, why don't you mark prescriptions so that other pharmacists will know what you have charged?

Suppose a family moves into your community to live and has a prescription which I have filled at a certain price. If I failed to mark it and you fill it and charge a few cents more, you lose that family's trade. For they believe you to be a high-priced man and go to the other store to trade, although you may not have charged an unreasonable price. Little things like this degrade the drug business.

I find many prescriptions with druggists' private marks on them, but if they would only use the N. A. R. D. mark instead, we druggists would know what had been charged. Let us make an effort to mark our prescriptions and thereby try to uplift the drug business some day to a profession.

Bridger, Mont.

S. E. HUGHES.

HE NEEDED HELP.

To the Editors:

You have had a lot of curiosities in the BULLETIN, but I am sending you one which

Doctor
Dear Sir
Will you Please give me an bottle
Elixir for Clean my stomach
I have little trouble with
Vomit Every day.
yours respectfully
your humble Servant
Peter Re

is not to be sneezed at. Did he get the "elixir?" He certainly did. F. C. W.

FROM SCOTLAND.

To the Editors:

"The greatest ever" is about the only expression in your "language" which I can find to cover the last number of the BULLETIN. Your journal is very interesting and readable, although many of the methods used for getting and keeping trade as advocated by pharmacists on your side would hardly suit over here.

DAVID W. ROBB.

Scotstown, Glasgow, Scotland.

To the Editors:

I have always liked your journal and think it one of the cleanest published.

W. C. BENDER,
 Pres. Missouri Pharmaceutical
 Association.

St. Joseph, Mo.

* * *

To the Editors:

We cannot afford to be without the BULLETIN, so you may send it for a couple of years anyway.

J. M. MARMADUKE.

PROFITS AND EARNINGS

AN INCOMPLETE STATEMENT.

A California druggist submits a statement of his business for 1910. He adds: "Will you please tell me how we stand including gross and net gain or profit, percentage of profit, cost and expense? The figures have been given to two bookkeepers with as many results. Their opinions vary."

Inventory, 1909	\$ 3,677.37
Inventory, 1910	4,200.68
Fixtures, 10% depreciation.....	1,626.11
Cash sales	19,656.90
Accts. receivable, less \$50 doubtful.....	742.94
Cash on hand, 1909.....	1,504.53
Cash on hand, 1910.....	618.58
Bills payable, none.	
Note payable	1,600.00
Cr. bal. jobber	25.00
Purchases, 1910	11,187.04
Transport charges	323.50
Cash discounts	123.49
Personal withdrawals	3,787.39
Expense of doing business.....	4,816.97

One thing is evident, our California friend is spending a lot of money. He drew out \$3787.39 for personal expenditure, which puts us in a critical mood at the start. He borrowed \$1600 without telling us whether he invested the money in his own business or a California fruit ranch. Maybe he spent it. We can't tell from the statement where it went.

In determining the profits for 1910, we find first that the inventory increased from \$3677.37 to \$4200.68, or \$523.31. Since bills payable and bills receivable are not given for 1909, we shall have to assume that they are the same as those of 1910. Next subtracting the purchases from the sales (\$19,656.90—\$11,187.04) = \$8469.85. Deducting the freight charges which properly enter into the cost \$8469.85 — \$323.50 = \$8146.35 gross profit.

Subtracting the expenses from the gross profit, \$8146.35—\$4346.32=\$3800.03. Notice we omitted from expenses one item which was charged there, namely, \$470.65, the interest on the investment. But the cash on hand shrunk from \$1504.53 in 1909 to \$618.58 in 1910, a shrinkage of \$985.97. Subtracting \$985.97 from \$3800.03 we get

\$2814.06. Adding the increase of inventory
 $\$2814.06 + (\$4200.68 - \$3677.37) = \3337.37
 net earnings of the store during 1910.

Dividing the gross profits by the total sales, $\$8146.35 \div \$19,656.90$, equals 41.44 percentage of gross profit. This is exceedingly large. Subtracting the expenses from the gross profits and dividing the result by the sales $(\$8146.35 - \$4816.97) \div \$19,656.90 = 16.93$ per cent net profit. Subtracting 16.93 from 41.44 we find the percentage of expense to be 24.51.

WHERE IS HE AT?

"G. K. A." submits the following details about his business and requests us to discuss them:

Assets	\$4870.91
Liabilities	2850.45
Difference	2020.46
Stock in trade.....	2212.81
Amt. goods purchased	5524.50
Cash sales	8144.05
Furniture	1795.00
Freight	24.51
Postage	34.64
Rent	240.00
Light account	42.50
Interest	69.76
Wages	972.50
Other expenses	232.00
Manager's salary	1075.00

This man appears to be considerably in debt. His liabilities, \$2850.45, exceed his own equities in the business, \$2020.46. While the assets are there to offset his indebtedness, it is very evident that G. K. A. is doing business largely on the other fellow's money. If hard times should come along and his creditors were to say "Pay up," where would he be? Our friend might find himself in the position of the young proprietor who tries to do business on the jobber's capital.

Our correspondent says his assets are \$4870.91, his liabilities \$2850.45, which makes his equities in the business \$2020.46. But in detailing his assets he shows items of stock amounting to only \$2212.81 and furniture \$1795.00, making a total of \$4007.81 instead of \$4870.91 as given in the statement. Deducting his liabilities from \$4007.81, his net worth is \$1157.36. This shows a discrepancy of \$863.10.

Allowing that the figures submitted cover the results of a year's operations ending on a

specific date, unless we have a list of figures covering similar items on the same date of the year previous, we cannot tell the accretions or profits. We can tell the man's worth, but not his profits. Thus we are not able to tell how good are his prospects of paying off his indebtedness.

We can't determine the profits by subtracting the purchases from the sales because we do not know whether all the goods bought were actually sold.

This statement only emphasizes the need of having complete data for the beginning as well as the end of a year's business, if one expects to tell much about his progress.

A MICHIGAN DRUGGIST'S STATEMENT.

The following is the statement of the business of a Michigan druggist which he submits for our comments:

Inventory April 1, 1910.....	\$1932.04
Inventory April 1, 1911.....	2877.03
Merchandise bought during the year.....	2595.72
Cash sales for the year.....	3900.00
Total freight charges.....	41.89
Total cartage charges.....	12.22
Store expenses for the year.....	50.48
Bills paid in cash.....	29.64
Advertising account	19.45
Cash taken from till.....	234.14
Goods taken from store.....	23.52
Cash for personal use.....	199.34
(Last three being household expenses.)	
Cash paid for lumber.....	14.51
Insurance	103.62
Revenue tax	25.00
Taxes	20.26
Merchandise paid for but not on hand.....	23.85
This last item was inventoried in the fixtures at the regular retail price.....	35.00
Total checks drawn for all purposes.....	\$3914.40

In discussing this statement we shall confine ourselves to the arithmetical calculations as they are very plain in their meaning.

Inventory, 4/1/10	\$1932.04
Bought during the year.....	2595.72
Bought for cash.....	29.64

Gross merchandise	\$4557.40
Inventory, 4/1/11	\$2877.03

Merchandise sold	\$1680.37
Expenses:	
Freight	\$ 41.89
Cartage	12.22
Store expenses	50.48
Advertising	19.45

Lumber	14.51
Rent	8.00
Insurance	103.62
Taxes	45.26
	<hr/>
	\$ 295.43
Adding salary	1000.00
	<hr/>
Total expenses	\$1295.43
Personal expenses:	
\$234.14	
23.52	
199.34	
	<hr/>
\$457.00 included in salary.	
Receipts	\$3900.00
Expenses	1295.43
	<hr/>
Net receipts	\$2604.57
Merchandise sold	1680.37
	<hr/>
Net profits	\$924.20

This net profit is too large. Let us check up his total cash payments to see where the trouble is:

Merchandise bought	\$2595.72
Net store expenses	295.43
	<hr/>
	\$2891.15
Personal cash	199.34
	<hr/>
Total payments	\$3090.49

Thus he only accounts for \$3090.49, when he claims having drawn checks for \$914.40. Take off the difference of \$900 and he is only making a bare living.

Some bills payable must have been omitted from his statement. Even if he has a \$2000 building and a \$3000 stock, his whole investment is only \$5000. To make a net profit of \$924 over and above a salary of \$1000 with a small investment like this is practically impossible.

A TEXAS BUSINESS.

One of our readers says that his business is "very, very profitable." While we take his word for it, the statement submitted doesn't prove it. He writes:

"My stock, including all the fixtures, the safe, and desk, amounts to \$2100.06. The only help I had was a boy who began work on June 1 and continued to September 15, when he was taken sick and quit for the year.

"I make a pretty full line of 'my own' prep-

arations, and my profit is very, very satisfactory.

"My low rent is accounted for by the fact that I rented a building, then sublet two-thirds of it, thus reducing my own rent to \$12.50. My storeroom is 12x30 feet.

"This is a town of 12,000, with five other drug stores, four of which would be a credit to any town. I advertise mine as the 'One-Half Drug Store.' Traveling men frequently tell me that I have the 'best thing in town.'"

CASH SALES AND EXPENSES FOR 1910.

Rent	\$150.00
Clerk	175.00, 3½ mos.
Light	75.00
Phone	36.00
St. tax	12.00
Ins.	30.00
	<hr/>
	\$478.00
Stock, including all fixtures.....	\$2100.00
Sales	\$8187.00

On the face of things this proprietor is a hustler. His stock, even including fixtures, is only \$2100, while his sales amount to \$8187. He is turning his capital over about four times a year, which is doing remarkably well. Two or three times are considered satisfactory. That he is certainly selling goods is very evident, but at what price? Anybody can give goods away or roll up a large volume of business by selling closely. Without the purchases we can't tell from the sales whether our correspondent is making a profit. He may be losing money for all we know.

His expenses are small. They total only \$478.00. Dividing this by the sales, \$8187, to find the percentage of expense, we get 5.8, which is too low to be correct. Several expenditures must have been omitted. Even if we add a thousand dollars for the manager's salary, we get only 18 per cent and a fraction, which is still so small as to make us suspicious that it does not tell the whole truth.

A BOMBAY magazine, *Indian Education*, gives some fresh specimens of Babu English. Of one schoolmaster a pupil wrote this description: "He was a stern-faced peddlegog." Another writer says that a certain official, "a nice majestic gentleman, inhabits a most pompous bungalow." An essay on "The Town in which I Live" closes: "And we bewholed the hole pherment of heavens and stars and the school sticking reflected upside down in the pond erected by our worthy Collector."—*Troy Times*.

THE SODA FOUNTAIN.

"NO SODA LIKE WIECHMANN'S."

By F. G. EBNER.

"And ye shall know the truth" is a biblical excerpt, which holds good with those who partake of the soda water dispensed by Wiechmann Brothers, two "live wires" who operate an apothecary shop in Wausau, Wis. Wausau is a town of 17,000, but from what you see of the place, it impresses one as a hummer from a business view-point. Considering the fact that it is a wide-open town where plenty of Milwaukee's favorite beverage is dispensed, the Wiechmann boys found

Two inside pages of the Wiechmann booklet.

there were a great many people who didn't drink beer when they could get good soda, or could not drink beer because their physician advised not to, or because their digestive organs wouldn't stand for it. The Wiechmann boys "got busy." When the Wiechmann boys "get busy," it means something.

One of the boys went over to the display rooms of some of the big soda fountain concerns. Within two weeks after March 1 they had a big sanitary soda-water fountain smiling at every man, woman, or child who entered the portals of this striking pill shop.

While the soda fountain was being installed, they called in several printing establishment representatives, and within a very short time "a little soda-fountain drink booklet" was evolved which beats anything ever concocted by an Elbert Hubbard or any other literary genius not excepting any one.

It was a pretty piece of printing. The cover was green. The inside pages were white with a greenish-blue mottled effect. The type throughout was black. We are reproducing two of the inside pages showing a part of the soda menu. In dimensions the booklet was 4 by 6½ inches. The booklet certainly brought business to the fountain.

While the Wiechmann boys say they never took a literary course, they are right there when it comes to

putting out something nifty or tasty, whichever they prefer. Being of Irish descent they chose green as the color scheme of a six-page snappy booklet.

From the text, it is evident that they are town boosters. They don't forget to say that Wausau is the greatest town in the country. The store itself represents the personality of the men behind it. Little signs call attention to various articles for sale. With their good, up-to-date soda concoctions, polite and quick service, they have won over many people who never drank soda. They have made the resident people of Wausau realize that there is another thirst quencher besides the "flowing bowl" of the rathskeller.

"BANANA SPLITS."

We know that soda dispensers are interested in "banana splits" for the reason that one or two recipes for this dish were contributed to our recent soda formula contest. The *International Confectioner* for April has a rather comprehensive article on the subject, from which we quote in part as follows:

"The name 'banana split' includes the sundaes which have as their base a banana, peeled, and then split in two lengthwise. These are served in some oblong dish. The old-fashioned bone-dish makes a very attractive service. Some use a small platter, but they are rather too shallow. The fountain houses, many of them, have an oblong glass dish, with dipper sides, which makes a very neat service. In selecting a dish to be used, much taste may be displayed, and either glass, china, or silver may be used. When these banana sundaes are properly and neatly served, they are very attractive, and make good sellers; and they should bring a good price.

"But in some stores where ice-cream soda, etc., is sold for five cents, the banana split is sold at ten cents. Where this is done, some use only one-half of the banana, but it is better to use a whole small one. But we do not advise the sale of these combinations for less than fifteen cents; and many of them should bring twenty cents. Our experience leads us to believe that fancy sundaes can be made to produce a reasonable profit, and to do this you must obtain fifteen cents for these fancy combinations, where you charge ten cents for the plain dish of ice cream. In the following formulas, where the expression split banana is used, it refers to a banana that is peeled, split in two lengthwise, and then placed in the dish.

BANANA SUNDAE, PLAIN.

Place two No. 20 mounds of vanilla ice cream close together on a split banana, and cover with whipped cream so as to make an oblong mound. Sprinkle the whipped cream with grated sweet chocolate and drop a maraschino cherry in the center.

BANANA BEST.

At one end of a split banana put a No. 20 mound of vanilla ice cream, and at the other a No. 20 mound of strawberry ice cream. Over each mound of ice

cream pour some cherry syrup and top with a cherry. Sprinkle with chopped walnut meats and put a small ladle of whipped cream between the mounds of ice cream, and top with a green and a red cherry.

BANANA FRUIT AND NUT SUNDAE.

At each end of a split banana place a No. 20 mound of vanilla ice cream. Between the mounds put a portion of whipped cream, and top it with a maraschino cherry. Around it drop a few slices of citron. Cover one of the mounds of ice cream with chopped mixed nuts, and the other with chopped mixed fruit, or a good fruit salad.

BANANA FRUIT SUNDAE.

At either end of a split banana place two No. 16 cones of vanilla ice cream. Over each cone pour a small quantity of crushed fruit. The same fruit may be poured over both cones, or a different fruit over each, to suit the taste. Place a portion of whipped cream in the center, and top with a cherry.

BANANA NUT SUNDAE.

On a split banana place two No. 20 mounds of ice cream, putting a spoonful of chopped nut meats between the mounds of ice cream. Over each mound of cream pour a different crushed fruit. Crushed cherries and pineapple make a good combination, or a portion of whipped cream may be placed in the center and some nut dressing, such as maple pecan, or chocolate walnut, poured over one of the mounds of ice cream.

BANANA SUNDAE A LA DELMONICO.

Place a small fern on an oblong dish, and lay a split banana on it. On the banana place two No. 20 mounds of vanilla ice cream. Over one of the mounds pour some chocolate syrup, and over the other pour some coffee syrup, and top with whipped cream.

TWO ORIGINAL SPECIALTIES.

Two formulas for novelties at the fountain have been contributed by readers of the BULLETIN:

FROZEN TAFFY.

(W. T. Beam, Moundsville, W. Va.)

Here is a ready seller:

Pure cream	1 gallon.
Maple syrup	½ gallon.
30 eggs well beaten.	

Mix and freeze. Serve as ice cream at 10 cents.

This has tough texture, is yellow, and resembles taffy.

HEAVENLY SLUSH.

(O. Roy Steadman, Toronto, Ontario.)

We have had the greatest success with a soda specialty which we call "Heavenly Slush."

Maple walnut ice cream (we use a No. 12 disher).
Three or four sliced dates.
Maple syrup, ½ ounce, poured over the mixture.

Cover with whipped cream and a few nuts.

SODA-WATER PUBLICITY.

E. F. White, writing in *The Spatula*, offers some helpful hints on the sale of soda water. He says in part:

In some way the public must be apprised of what you have in the way of drinks and how excellent they really are. This bit of judicious self-praise will start the public talking, and then you must give them something to talk about. Have the quality of your drinks above question and have them served properly, so that they will be worthy of public praise. If you are enthusiastic and persistent in spreading the news you may be sure that you will not lack help, but just as surely as you stop your efforts the public will stop talking about your drinks. This class of advertising is expensive and cannot be followed up all the time, but something must keep things going between these printer's ink efforts.

The next best advertising is that which is done on the premises. An occasional window display of something that advertises your fountain is a good idea. Much that can be used in this line is of course by nature perishable, and therefore it cannot be kept up all the time. Nevertheless, advertising always costs money and one can as well put a dollar or two into fruit for display purpose once in a while as into anything else. You must not expect that you can obtain very much real good advertising free.

A bulletin board set out on the sidewalk is made to do good service in many places in telling the public that you have soda and something regarding its quality. By far the most effective of all local advertising is the window strip display announcing some of your fountain creations with some simple expression intended to convey its superiority over the general run of that class of drinks such as "Our Delicious Egg Drinks," or "Our Chocolate is unsurpassed." Do not use too many of these strips at once. Use them merely as a means to bring the public in and tell them what you have after they are at the fountain.

When the customer has been drawn into your store there are various ways of informing him of what you have. The menu card is a good way. The length of menu and the number of drinks must, of course, depend upon your location and the size of your fountain. In a small store where space is limited it is best to push only the popular drinks.

But the menu at best is slow, very few comparatively will take the trouble to read it over. What is needed is plenty of good plain neat signs about the fountain announcing not only the special and fancy drinks but also the plain ones as well.

These signs are valuable. Don't be so fastidious about the appearance of your fountain that you don't want them, but have them just as nice as you like. Some fountains have more mirrors than they need; some of them might easily be turned into lists of beverages. Made on the glass in black and gold letters they would look very nice.

Have your signs so plain that at a glance one can select something from the list that will suit him and his purse. Always have the price on your signs. Never

try to get the public to order a 10-cent drink under the impression that it is a 5-cent one.

For pushing a special drink, or for telling of the excellence of your chocolate, package slips are excellent. Let them be long, narrow slips with the simple explicit wording in the center, "Smith's chocolate ice cream soda—my! but it's good!" Don't use hackneyed phrases in such cases. Branch out into your own language.

THREE CHOCOLATE FORMULAS.

Last month we printed many recipes that were contributed to our prize contest for the three best soda formulas. Here are three methods of making chocolate syrup that were held out for reasons of space:

COLD CHOCOLATE SYRUP.

(R. J. Jenkins.)

In making a chocolate syrup it is a very common mistake on the part of dispensers to use vanilla extract. Such a flavor is not strictly speaking a chocolate but rather a mixture of vanilla and chocolate. Here is one of the most satisfactory chocolate syrups I know of:

Granulated sugar	48 pounds.
Cocoa	4 pounds.
Boiling water	4 gallons.

Mix the cocoa and sugar well before adding 1 gallon of hot water, add water slowly, stirring all the time, and stir until the mixture is entirely free from lumps. Put it on the stove, add the balance of the water and bring to the boiling point, *but do not boil.*

CHOCOLATE SYRUP.

(J. W. Giesburg, Kansas City, Kansas.)

Cleanliness and service combined with pure syrups and fruits first, last and all the time tell the story of

success or failure with a fountain. And speaking of syrups stick a pin right here, as chocolate is by far the most popular and called-for flavor at the fountain. Be sure you have the kind that "tastes like more." None of our customers ever leave any in the glass.

Take 18 ounces of powdered chocolate, to which add 24 ounces of boiling water, stir well until perfectly smooth, and add $\frac{1}{2}$ gallon of hot syrup. Stir until there are no lumps, strain, and add $1\frac{1}{2}$ gallons of hot syrup; boil 15 minutes. When cool, add an ounce of vanilla extract and strain again. "That's all."

CHOCOLATE SYRUP.

(Lou E. Phelps, East Smithfield, Pa.)

This chocolate syrup is a favorite with us:

Greaseless powdered chocolate.....	2 ounces.
Granulated sugar	$1\frac{1}{2}$ pounds.
Hot water	$1\frac{1}{2}$ pints.
Vanilla extract	1 teaspoonful.

Mix the chocolate and sugar in a porcelain or agate dish, pour in the cold water to make a stiff paste, then add remainder of the water, stirring to remove lumps. Boil the mixture 15 minutes, stirring with a wooden paddle to keep it from burning. When cool, add vanilla.

LEMON BEVERAGES.

CYCLE PHOSPHATE.

Into an eight-ounce glass, draw one-half ounce of lemon and one-half ounce of orange. Add two or three dashes of phosphate and fill with carbonated water.

ENGLISH SHERBET.

Into a ten-ounce glass, draw three-fourths of an ounce of grape syrup and three-fourths of an ounce of pineapple syrup. Into this squeeze the juice of one-half lemon, then fill with carbonated water and mix.

A CHINESE ESTABLISHMENT.—This is the interesting building in Amoy, China, occupied by the Fukien Drug Co., Ltd. The photograph, neatly mounted on a folder, was sent out with greetings to the firm's friends and customers.

BUSINESS HINTS

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

An Ethical Ad.—

That it pays even the purely ethical pharmacist to advertise has been the experience of Leonard A. Seltzer, of Detroit. Some time ago he ran the following

Ask Your Physician

In case of illness in your family the best of medical attention and the best in prescription service is none too good. It is well worth while to be absolutely certain about medicine, and the best way to be sure is to send all prescriptions to Seltzer's Professional Prescription Pharmacy, because your physician knows that he is certain to get just the medicinal action that he expects from the remedy prescribed, if the prescription is prepared by Seltzer.

Our Reputation

We have a reputation, not only locally, but all over the United States, for conducting the drug business upon a plane that is far above that of any Pharmacy in this part of the country. We do not wish to appear egotistical—we are only proud of the results we have secured.

Our Policy

It has always been our policy to concentrate our efforts upon the preparation and dispensing of medicines, and to confine our sales to medicines, to articles used in their application, and to such other articles as are required in caring for persons needing medical attention.

Our Prices

Our prices are always reasonable—no higher than should be charged for the quality of goods and the high-class service we supply. It is a mistake to suppose that because we might justly charge more than our competitors that we do so; we positively do not, as we have proven many times by actual tests.

SELTZER'S PHARMACY

PROFESSIONAL PRESCRIPTIONISTS

32 ADAMS AVENUE WEST - - IN THE SHURLY BUILDING

Phone Main 4011

insertion in a local newspaper, using about an eighth of a page for the copy. The ad. is of interest in showing the arguments which a professional druggist of Mr. Seltzer's type can advance to customers.

An Opening Day.—

On April 15, Clarke F. Hess of Norristown, Penna., had an opening and souvenir day. He had just taken over the store from Joseph Lowenberg and took this means of announcing the new ownership.

The invitation consisted of a four-page folder somewhat larger than ordinary writing stationery, 5½ by 8½ inches in dimensions. The paper was blue and the envelope of the same color. At the upper

left-hand corner of the envelope appeared a catchy line.

Announcement

FROM HESS, THE DRUGGIST
213 East Main St., Norristown, Pa.

The cover of the invitation was simple:

CLARKE F. HESS

THE DRUGGIST

Invites You to Attend His

OPENING

and Souvenir Day

Saturday, April 15, 1911

at the Drug Store formerly owned by

JOSEPH LOWENBERG

213 EAST MAIN STREET

NORRISTOWN, PENNA.

Bell Phone 1416-A

Free Souvenirs for All

The inside pages held out to readers several inducements. Souvenirs and samples were offered free, while several popular articles were quoted at unusually attractive prices.

A Good Cigar Ad.—

A month or two ago in this department of the BULLETIN we reproduced four ads. which had been gotten up for druggists by the C. E. Zimmerman Co.

**That's what
it surely is!**

Your dreamy, pleasing satisfaction of a good smoke is greatest when you have the right kind of a cigar.—the sort you like. All brands are carried at this store. We have your favorite—moist—well kept—just ready to light up and enjoy. Call in and try one.

Tobacco is a hobby of ours. We have a stock of tobaccos—smoking and chewing—that is as well chosen and kept as that of any big city cigar store. Your inspection is cordially invited today.

**Name and address of store here
in bold face type**

of Chicago. We are now showing another one—intended for the exploitation of the cigar business. It strikes us as a very attractive ad. and one likely to produce results.

CAPSULES OF SCIENCE

Prepared by PROF. W. L. SCOVILLE.

The Best Caramel.—

A. Herzfeld says that the proper way to produce caramel is to first make invert sugar by heating with tartaric acid. This invert sugar solution is then heated in an oil-bath to boiling point, then ammonia water is gradually added while the water evaporates, after which the temperature is raised to 175-180° C. until all is caramelized. The caramel thus made is stated to be readily soluble in 80-per-cent acid, nearly tasteless, and unaffected by acids. It is also nearly twice as strong as commercial caramels in coloring power.

The Arsenic Antidote.—

G. Lockemann says that the amount of arsenic which ferric hydroxide will absorb depends upon the amount present and upon the temperature. At 0° C. 0.1 milligramme of arsenic requires 150 times its weight of ferric hydroxide, but 500 milligrammes requires only 5.4 times its weight. At 25° C. one and one-third times as much iron hydroxide is required, and at 80° C. twice as much as at 0° C. An excess of sodium, potassium, or ammonium hydroxide further reduces the absorbing power of the iron.

All Alike Legally.—

O. Gros says that weak acids favor the anesthetic action of cocaine, eucaine, etc., while strong acids reduce it. For instance, novocaine bicarbonate is five times as powerful as an anesthetic as novocaine hydrochloride. Cocaine, novocaine, eucaine, alpin, and stovaine are about equal in anesthetic power as bases, but their hydrochlorides differ in power. Eucaine and stovaine are the most injurious to tissues, while novocaine is least injurious to the tissues.

Canadian Enterprise.—

A plant for the manufacture of alcohol from sawdust is soon to be established in Ontario, Canada. The sawdust is to be digested with sulphurous acid under a pressure of 100 pounds and the glucose so obtained fermented. The residue is said to be of value as a cattle food. One ton of dry sawdust will yield 30 gallons of 94-per-cent alcohol, 76 pounds of acetic acid, and $\frac{3}{4}$ ton of stock food. The plant will have a capacity of 100 tons of sawdust per day.

The Evolution of Protoplasm.—

A Russian chemist says that there are two forms of protoplasm—"ameboplasm," which is characterized by ameboid movements, requires oxygen for development and withstands temperatures up to 120° C., and "mycoplasm," which is found in molds, bacteria, etc., which possesses no movement, does not require oxygen, and withstands temperatures up to 200° F.

Gentian, Dried or Fermented.—

Bourquelot and Bridel state that gentian roots which have been placed in piles and allowed to ferment during the drying process lose the gentiopicroin, but when

dried in an oven, or in thin layers, the gentiopicroin is preserved. Gentian properly dried is not as bright in color, but is much better medicinally.

Alcohol and Digestion.—

Petit says that 18 per cent of alcohol conceals the digestive power of pepsin, but that it does not injure it even on long standing. When diluted with water the original activity of the pepsin is restored. The tests were made on a solution of pepsin $6\frac{1}{2}$ years old and containing 18 per cent of alcohol.

"Hard" Drinks vs. "Soft."—

Two German chemists find that the drinking of hard water produces better teeth, and probably stronger bones, than soft water. They also state that potatoes boiled in soft water lose most of their salts, through solution in the water, but in hard water the salts are retained.

Huh?—

E. Dorn has observed the indices of refraction of the ethyl esters of ethoxybenzylaminoalphaethylcinnamic acid and of cholesterol propionate at varying temperatures, and concludes that the first have elongated molecules while the latter are disk-shaped.

Vanity the Mother of Invention.—

A glass mirror has been found in a Roman burying-ground which is believed to be 1700 to 1800 years old. It was probably made to reflect by attaching lead-foil to the glass with a resin, but the lead and resin has now combined, forming a resinate of lead.

Theobromoretically.—

Veley and Waller say that theobromine is 1.8 times as powerful (toxic) as caffeine, and that caffeitanic or tannic acid further reduces the toxicity of caffeine. Caffeine-free coffee showed much less toxic effect than natural coffee.

Negro Chemistry.—

Sunlight is found to be much more active in chemical effects in the tropics than in temperate climates. In some cases it produces chemical changes which do not occur in colder climates.

BOOKS

"CHRIST THE HEALER."

A 24-page pamphlet with the foregoing title has been issued by the Open Court Publishing Co. of Chicago. It brings together some quite remarkable material and some quaint pictures which have been collected by Dr. Edward Kremers, director of the pharmacy course in the University of Wisconsin. Dr. Kremers's researches into the history of pharmacy and allied subjects are well known, and he is preserving a great deal of valuable data which otherwise would be buried and lost. We do not know the price of the present brochure, but we assume that copies will be furnished for something like 25 cents each.

PRACTICAL PHARMACY

Some Interesting Facts about Hydrogen Peroxide.—

The publishers of *Modern Pharmacy* have an interesting editorial in the February issue on the subject of hydrogen peroxide. To quote in part:

"Chemically, hydrogen peroxide is acidulated water in which hydrogen peroxide liquid has been dissolved. Physically the water itself will evaporate just as water always does if given an opportunity, but with our product this evaporation in volume is *not accompanied by an equal reduction in the content of peroxide*. A bottle when left uncorked will lose part of its water, but upon assay will actually be found to have increased its proportion of H_2O_2 and will test above standard.

"One of the rigid requirements to which our product is subjected before it is bottled and placed on the market is an evaporation test carried out on a steam bath at 85° C. for fourteen hours. At the end of this time the volume is again made up to the original measure, and we require that when this is done the preparation shall not have lost to exceed 5 per cent of the peroxide gas originally present. This is a very severe test and we do not find that many peroxides will stand it.

"This proves again, what we have so frequently and so stoutly maintained, that a product carefully made and effectively preserved with a small quantity of acetanilide is astonishingly permanent. But of course all peroxide will decompose in time. It is the rapidity with which this takes place which differentiates the satisfactory from the unsatisfactory product.

"We repeat, however, that the best product will liberate a little oxygen gas. This gas accumulates in the open space at the top of the bottle, exerts some pressure on the cork, and assists the process of evaporation by causing some of the water to ooze out around even a tight cork if the package is placed on its side. In order to lessen this degree of pressure, we are now marketing our pint packages of hydrogen peroxide in 20-ounce bottles; this affords a larger space for the liberated gas, lessens the amount of pressure on the cork, and consequently lessens also the evaporation of the water."

Instances of the Utility of Acacia.—

J. Leon Lascoff, in a paper read before the Brooklyn Pharmaceutical Association on the subject of acacia and its uses in pharmacy, cited several instances where the gum may be used to advantage. He said in part:

"Frequently in practical dispensing I have found the use of acacia necessary to turn out a uniform, homogeneous mixture, and to provide for an equal division of doses, as in the following:

Acid sodium oleate.....	0.1 gramme.
Acid salicylic	0.1 gramme.
Phenolphthalein	0.02 gramme.
Menthol	0.01 gramme.

M. ft. cap. mitte No. xx.

Sig.: One every four hours.

"It is difficult to make a proper mass of this com-

pound, but it may be done as follows: Rub the menthol into a fine powder and mix with the salicylic acid and sodium oleate. As soon as the mass begins to liquefy add a few grains of pulverized acacia and a few drops of water, followed by one drachm of sugar of milk and the phenolphthalein, when a nice, perfect white mass is produced, which may be divided into very small capsules.

Oil of turpentine.....	20 minims.
Pulverized acacia	30 grains.
Compound spirit of lavender.....	1 drachm.
Spirit of chloroform.....	1 drachm.
Castor oil	1 drachm.
Water, sufficient to make.....	2 ounces.

"It will be seen that a satisfactory emulsion cannot be turned out with the amount of acacia prescribed. The best way is to make an emulsion of the castor oil, using at least double the amount of acacia, and add the oil of turpentine and other ingredients.

Camphor	1.0 gramme.
Anisated solution of ammonia.....	3.0 Cc.
Infusion of digitalis.....	180.0 Cc.

M.

"Add a small quantity of acacia to the camphor and add the other ingredients in order."

Impurities in Lime-water.—

Otto Muhlhan, in a paper read before the last annual convention of the Ohio State Pharmaceutical Association, suggested an improvement in the official method of making lime-water. He claimed that the present process of agitating the slaked lime (12 grammes) with 400 Cc. of distilled water and decanting once does not rid the lime completely of the chloride and other soluble impurities present.

He suggested that the lime be thrown on a filter and washed with hot distilled water until all chlorides are washed out; then one may proceed according to the present formula. It were better still to have a purified calcium hydroxide official in the U. S. P., with tests of purity, and then to make the lime-water from this by adding a certain quantity to a certain amount of distilled water and decanting or filtering.

Preserving Glucosidal Drugs.—

At a recent meeting of the Washington branch of the A. Ph. A., Lewis Flemer described a method of preserving plant drugs containing glucosides which he believed was first introduced by Dr. Rusby. This consisted in placing muslin bags containing freshly calcined lime in the container with the drug. His experience with this method has not been altogether satisfactory, and he inquired regarding the nature of the container used abroad. In answer to this inquiry it was pointed out that in Switzerland, where the preservation of drugs over calcined lime was suggested in the Pharmacopœia, it is a common practice to use a tin container with a well-fitting lid and a double bottom. In the double bottom of this container freshly calcined lime is placed and the drug itself put in a bottle not necessarily tightly stoppered, over the lime. This container, it was pointed out, has the double advantage of preserving the drug from light as well as moisture, and would no doubt be practicable and advantageous in connection with drugs like digitalis which are supposed to be readily decomposed.

SERVICE DEPARTMENT

In this new department of the BULLETIN the market wants are indicated of those subscribers who are not able to find what they desire, and who are anxious to be put in touch with sources of supply. In some instances we have brought inquirer and manufacturer together, but in all cases it would pay other manufacturers to follow up the clues here given. We shall be glad to furnish the full name and address of any inquirer to producers or distributors who write us for this information. Readers of the journal on their part are earnestly requested to send us a description of their wants: we are anxious to make this department as valuable as possible to them all.

Glass Signs for the Windows.

49. W. Brothers are anxious to be put in communication with a concern which makes a specialty of manufacturing signs for use on the window-panes. The idea is to have separate letters which can be employed to spell different words or phrases. W. Brothers think these letters are made of glass or composition, and they are used by pasting them on the plate-glass front. The ones in mind are concave gold letters.

Fans Propelled by Gasoline.

50. W. Brothers also write as follows: "Do you know of a firm making fans propelled by gasoline? I am informed that there is a company in Chicago, but I have written them on two or three occasions without getting any replies. If you know where such fans are made and can put me in communication with the factory we should very much appreciate the courtesy."

New Fixtures.

51. M. C. W. is in the market for a complete set of new fixtures for a branch store just established. He wants to be put in touch with all of the leading manufacturers.

Cases.

52. S. S. R. wants to get one or more cases like those used for Humphrey's Specifics, Diamond Dyes, Diola Dyes, the Broncho Homeopathic remedies, etc. He would appreciate it if manufacturers of cases of this kind would write to him and give him quotations and specifications.

Metallic Plates as Silver Cleaners.

53. J. J. D. writes as follows: "I understand that there are aluminum plates now on the market which are used as a safe substitute for potassium cyanide as a cleanser for silverware. This is a new one on me as I have no doubt that it is to a great many others. We cannot afford to remain in ignorance of this information, and we should like to know where these aluminum plates can be purchased."

Metal Caps for Glass Bottles.

54. E. P. Mc. desires finding the manufacturer of the "Phoenix cap" for glass bottles used, among other manufacturers, by the makers of Wright's Silver Cream. Our correspondent would like very much to be put in communication with these people.

An Engine for Motion Window Displays.

55. T. A. S. wants to know about some manufacturer or jobber who has for sale a mechanical engine that would run at least five hours with one winding. This is to be used for operating a motion window display requiring but little power. Our correspondent explains that he has no water or electricity for the purpose, and he thinks dry cells or electric motors are too expensive to use. Something like the ordinary mechanical engine would be the most economical and would do the work if it did not require too much winding.

Machines for Filling Powders.

56. A. S. W. wants to know of reliable firms who manufacture machinery used for the purpose of filling powders, and machines also for the manufacture of pills.

Straw Dispensers for Use at the Soda Counter.

57. The W. Drug Co. writes: "About two years ago we purchased a patent straw case or deliverer. If we mistake not we bought it from some Chicago house, although we believe the article had been patented by a Texan. We are unable to locate the address of the makers, and are unable to find them advertising the affair. It is a glass case with a roller at the bottom that delivers the individual straw as desired. If you are able to place us in communication with the manufacturer we will appreciate it, or should you know the address of the maker we would appreciate your having them send us two of the affairs by express C. O. D. We have found the device a saving in straws, as well as sanitary."

POLICING MEXICO CITY AT NIGHT.—To those who watch with interest the struggles of American municipalities over the police problem, the following statement from the New York *Evening Post* may offer some suggestions. It refers to the police system in the City of Mexico, where it is reported to be thoroughly satisfactory:

Each policeman on night duty starts out with a lighted lantern. He places it in the middle of the street, at the point nearest to the center of his beat where two streets intersect. He is forbidden to move out of sight of the lantern. If one requires the services of a policeman, a glance up or down the street will show the gleam of a lantern. The policeman is always near-by. Encouragement to strict attention to duty is provided by a standing reward of \$5 to any one who will bring a policeman's lantern to a station-house. The officer who loses his lantern is mulcted \$5, and otherwise disciplined to teach him to pay closer attention to business. Each policeman is required to keep a record of the persons living on his beat, and he is held accountable for failure to report a case of illness. Mounted police patrol the outskirts of the city. At brief intervals through the night every policeman sounds a whistle, which must be replied to by the man on the next beat. If no response is forthcoming, the roundsman or another policeman goes to see why the signal is not returned.

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Ringworm Applications.

H. G. H. asks us to print formulas of ringworm applications, some for human use and others for cattle.

For the human, the following preparations are suggested. They should be rubbed in well several times a day:

- (1) Iodine2 drachms.
Potassium iodide1 drachm.
Alcohol6 fluidrachms.
Water, to make.....2 fluidounces.
- (2) Precipitated sulphur1 drachm.
Ammoniated mercury1 drachm.
Salicylic acid40 grains.
Wool-fat, hydrous1 ounce av.
Petrolatum1 ounce av.

Unna's compound chrysarobin ointment:

- (3) Chrysarobin160 grains.
Ichthyol100 grains.
Salicylic acid60 grains.
Petrolatum2 ounces av.

Ringworm in cattle usually attacks old, underfed animals where stalls are poorly ventilated and unclean. The stalls must first of all be thoroughly cleaned, aired, and whitewashed with lime, and the affected parts of the animal treated with the following:

Green soap10 ounces av.
Water10 fluidounces.
Pine tar.....5 ounces av.

Heat on a water-bath until of a uniform consistency.

Wash the entire body of the animal every two days with warm green soap solution (1 to 20), rinse with warm water, and when the animal is dry rub the above ointment well in under the hair.

The U. S. Bureau of Animal Industry directs this treatment: Remove all crusts by washing with soap and water, then apply acetic acid, sulphur ointment, tincture of iodine, or citrin ointment once a day. Cleanse the stable and whitewash it to destroy the spores scattered by the crusts.

Carpet Bug Exterminators.

G. L. O. writes: "I have quite a number of calls for something to exterminate carpet bugs. Can you tell me how to get rid of this pest?"

This insect is generally spoken of as the "buffalo moth," "carpet beetle," and "carpet bug."

Tobacco, pepper, camphor, carbolic acid, and oil of turpentine have all been recommended for destroying or driving them off, but none of these remedies seem to be of much avail.

Benzine, kerosene, and good insect powder appear to be the most efficacious substances with which to com-

bat this pest. Carpets which are infested may be soaked in gasoline, which, if of good quality, will leave no odor or stain. When the carpets are taken up it is a good plan to pack all the cracks in the floor with cotton, which should then be saturated with gasoline. When the larvæ are found to be injuring furs or clothes hung in the closet, it would be best to use insect powder.

It is stated that the insects in carpets can be destroyed by laying a wet sheet on top of the carpet and passing hot flat-irons over it. The steam thus produced destroys the grub. In recommending the employment of gasoline the dangerously inflammable nature of the liquid should always be called to the attention of the user and necessary precautions suggested. The late Dr. Riley of the Department of Agriculture recommended this treatment:

Bare as many rooms as possible at house-cleaning time, and, after carefully removing all dust, spray benzine by means of an atomizer into all of the floor cracks and under the baseboards until every crevice has been reached. The carpets, after thorough beating, should be slightly sprayed in the same manner. Benzine quickly evaporates and leaves no odor.

Another method of extermination which has been recommended is fumigation with formaldehyde.

Glue for Paper Pads

R. W. T. wants a preparation for printers' use to glue paper pads. Here are a few:

- (1) Glue3½ ounces.
Glycerin8 ounces.
Water, a sufficient quantity.

Pour upon the glue more than enough water to cover it and let it stand for several hours, then decant the greater portion of the water; apply heat until the glue is dissolved, and add the glycerin. If the mixture is too thick, add more water.

- (2) Glue6 ounces.
Alum30 grains.
Acetic acid.....½ ounce.
Alcohol1½ ounces.
Water6½ ounces.

Mix all but the alcohol, digest on a water-bath till the glue is dissolved, allow to cool, and add the alcohol.

- (3) Glue5 ounces.
Water1 ounce.
Calcium chloride1 ounce.

Dissolve the calcium chloride in the water, add the glue, macerate until it is thoroughly softened, and then apply heat until completely dissolved.

- (4) Glue1 pound.
Glycerin4 ounces.
Glucose syrup.....2 tablespoonfuls.
Tannin1-10 ounce.

Use when warm and allow the glue an hour to dry and set on the pads. This can be colored with any aniline dye.

"Beer Seed." What is It?

W. R. M. is looking for the recipe of a beverage that we do not know how to make. He says: "Since I was a boy 65 years ago I have known of a substance resembling tapioca, called 'beer seed.' It is used by the country people of my acquaintance to make a summer drink which affords a substitute for milk. The beer is made by putting a few spoonfuls of the 'seed' in a gallon or so of sweetened water. After a few hours fermentation sets in and the 'seed' increases in number. What is this 'beer seed' and where does it come from?"

This is something of a sticker. The seed to which

PHARMACY STUDENTS CELEBRATE.—The 21st anniversary of the Washington State University was observed with proper ceremony by the students and faculty. Members of the Pharmacy Department took a prominent part in the parade, as may be seen from the accompanying half-tone. One-fifth of all the graduates from the Washington institution are from the Pharmacy Department.

you refer may possibly be kefir grains. They are described in the dispensaries, but are not used much in this country. Or perhaps the seeds are a dry yeast. We are told of a Russian beverage called quas. It is made by planting the crust of rye bread in water presumably sweetened, as alcohol develops later. Fermentation sets in. The bread floats on top of the water for a few days, but later becomes laden with a fungus and then settles to the bottom. The supernatant liquid is used as a beverage.

Distemper Remedies.

P. P.—We do not know the composition of the proprietary distemper cure which you mention.

The following remedies have been suggested, but we hesitate to offer them. The services of a trained veterinarian are usually necessary to treat this variable and trying disease:

DISTEMPER POWDER.

Potassium nitrate	4 drachms.
Black antimony	2 drachms.
Sulphur	1 drachm.
Fennel, powdered	1 drachm.

Mix. From 10 to 30 grains of this mixture is sufficient for a dose.

DISTEMPER PILLS.

Antimonial powder	2½ grains.
Mercury, with chalk	2 grains.
Dover's powder	3 grains.
Quinine sulphate	1½ grains.
Extract of nux vomica	½ grain.

Make into one pill, one such to be given twice or three times a week.

The Prospects for a Deaf Clerk.

A drug clerk submits a rather pointed query. He asks: "What are the prospects of a drug clerk who is slightly deaf? My hearing is not so very bad, but it is somewhat unpleasant behind the counter at times. Would it hinder me getting a job as prescription clerk? Are prescription clerks in demand and what salary do they command?"

Slight deafness would be a handicap in a large city where people are in a hurry and want quick service. But in a small town, in a place of not over 10,000 inhabitants, your chances are very fair. Be neat, be courteous, work hard, and seek to make your good qualities compensate for any inconvenience that your

impaired hearing may cause. There are any number of men practicing pharmacy successfully who have the very infirmity you mention, and they not only compound prescriptions but wait on trade also.

Prescription clerks are in demand. They earn from 50 to 75 dollars a month.

Restoring Formaldehyde Solution.

S. J. & G. have been having trouble with their formaldehyde solution. They write: "When a solution of formaldehyde becomes cloudy and milky, quite a little white substance is formed, which, we understand, is paraformaldehyde. What can be done to restore its former condition? Is the remaining liquid when separated from the white solid matter of any strength as formaldehyde solution?"

We suggest warming the solution in a bottle that is loosely stoppered for several hours or until the precipitate goes into solution. To filter out the solid paraformaldehyde would weaken the solution.

Overcoming a Dispensing Difficulty.

C. B. asks: "What is the best way to compound one ounce each of stronger water of ammonia, tincture of iodine, and collodion? Is there any way of preparing this mixture so as to get a decent looking result immediately?"

Spirit of ammonia must be used in place of water of ammonia. A 28-per-cent spirit of ammonia would have to be specially prepared. Water of ammonia will not mix with collodion.

Remedies for "Chiggers."

E. D. H. wants a preparation for the treatment of screw-worm bites.

In previous issues we have suggested chloroform and also an ointment of menthol and methyl salicylate in a lanolin base. We understand that it is a common practice to first remove the insects mechanically by squeezing them out. Then the remedies are applied. L. H. Howard says that a saturated solution of sodium hyposulphite applied to a chigger bite will instantly relieve the itching.

PHARMACY STUDENTS CELEBRATE.—This was a gala event for the students, as may be seen from the accompanying reproduction of a photograph taken while the parade was in progress. Professor Watt, head of the Department of Pharmacy, permitted his automobile to be used for the occasion.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., JULY, 1911.

No. 7.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

Box 484, DETROIT, MICH.

THE MONTH'S HISTORY

FOOD AND DRUGS ACT VS. REMEDIAL CLAIMS.

The Department of Agriculture in general and Dr. Wiley in particular, have been defeated recently in a considerable number of cases which practically amounted to tests of debatable rules and regulations. From the very first the government has declared, for instance, that the misbranding clause of the food and drugs act affected therapeutic or remedial claims as well as statements regarding the identity and content of ingredients. Scores of patent medicine manufacturers, believing that the government was correct, struck the word "cure" out of the titles of their products, and many changes were made also in the language on the label regarding remedial properties.

As we reported briefly last month, however,

the Supreme Court of the United States, handing down a judgment in the Johnson cancer cure case, held that by no possible construction could the food and drugs act be stretched to touch at all upon the question of therapeutic properties. Justice Holmes, who wrote the decision, analyzed the act with some care and declared that Congress certainly had no intention of applying the words "false and misleading" to the curative claims that might be made for products. As our readers know, we have also reported upon similar decisions from at least three of the Federal Circuit Courts. The last case of the kind was that brought against the American Druggists' Syndicate with reference to its Peroxide Cream.

It will be recalled that some months ago Dr. Wiley expressed the strong conviction that not only did the food and drugs act outlaw exaggerated therapeutic claims made in the title or on the package of products, but also outlawed similar claims made in the newspaper or other advertising of these articles. His technical point was, we believe, that the advertisement was constructively a part of the label, and as such was brought under the jurisdiction of the law. A conference was held in Washington at which this idea was advocated, and it was generally believed that if the government won the cases then pending it would proceed to act on this broader view of the law's application. The recent Supreme Court decision has put a stop to all that, and will compel the government in the future to limit itself to cases of plain adulteration or where false and misleading statements are made regarding the character of products from a pharmaceutical or chemical standpoint.

In the meantime, however, President Taft has sent a strong message to Congress recommending that the food and drugs act be so amended right away as to include remedial claims within its jurisdiction, and if this is done the government will for the first time have legal warrant for its prosecutions in this direction.

OTHER GOVERNMENT DEFEATS.

Another contention which the government has made from the first is this, that a product could not be given the name of one of the ingredients in it unless that ingredient were in the majority, so to speak, or at least present in sufficient strength to make it the preponderating element. This point was also raised in the Peroxide Cream case, and again was the contention of the government defeated. The Federal Circuit Court held, as we reported last month, that while there was very little, if any, peroxide present in this cream, no claim of any particular amount was made, no misbranding was therefore perpetrated, and since peroxide was not one of the substances mentioned in the act it wasn't necessary anyway to give its actual content. It of course remains to be seen whether this particular interpretation will be supported by the higher court. A similar point was at issue in the Coca-Cola case, and the Circuit Court also held in that instance that the title was not misleading, and that the product contained enough of the suggested ingredients to justify the use of the name.

Still another contention made by the government has been that when one of the listed chemicals, acetphenetidine, for instance, is contained in a product, the name of the substance must not only be printed on the label in the customary manner, but there must also be a statement that it is a derivative of acetanilide. This point was contested by the Anti-kamnia Chemical Co. The latter has won its case in both the lower court and the Court of Appeals of the District of Columbia. Both courts have held that it is enough to mention the particular drug on the label, and that there is nothing in the law to compel any statement of the source from which the drug is derived.

* * *

CLEARING THE ATMOSPHERE.

One or two other positions taken by the government officials have likewise been rejected by the courts, but after all this is only what students of jurisprudence have been predicting ever since 1906. They have declared time and again that the Board of Food and Drug Inspection in Washington had devised, and was taking measures to enforce, regulations which were legislative in character, and which sought to read into the law things not

already there. Many of the officials of different States have similarly published regulations not warranted by the laws upon which they are based, and it is very gratifying that recent court decisions, soon to be supplemented by others in cases now pending here and there, will clarify the atmosphere and will teach the drug trade just what it may expect from the food and drug laws.

If these laws are not comprehensive enough the thing to do is to amend and supplement them. What we must have is *statutory* laws—not laws made by executive officials. If we countenance the latter, we shall never know where we are at, and any official will find it possible to harass industry to an enormous and embarrassing extent.

* * *

REGARDING PROFITS.

At the meeting in Battle Creek last month of the Michigan State Pharmaceutical Association (reported upon elsewhere in the present issue of the BULLETIN) a very animated discussion arose over a paper entitled "The Druggist and His Profits." Charles F. Mann, with a characteristic touch of Dutch straightforwardness, expressed vigorous impatience with the frequent statement made by writers on this subject, that patent medicines are often sold at a loss, and that certain other things in the store do not yield an adequate profit. His point was that it costs a good deal less to sell these things than it does, for instance, to dispense prescriptions, that for this reason it pays to handle them, and that it is all wrong to lead druggists into believing that such profits were too small and that the goods ought consequently to be thrown out of stock.

The obvious answer to this charge, of course, is that no one of experience ever urges druggists to abandon patent medicines even if they do yield too small a profit. These things have to be carried in stock, regardless of what profit they yield; and, furthermore, if they are abandoned, and nothing put in their place, the total sales drop and the percentage of expense correspondingly advances. The only object that writers have in calling attention to the close margin under which a good many things are sold in drug stores is to make pharmacists aware of the facts so that they can boost up profits on other lines and thus make the general average of profit show up satisfactorily.

F. E. Bogart pointed out that an astonishing percentage of the druggist's business was in proprietary articles of all kinds—patent medicines, soaps, special-brand sundries, and the like. Different speakers placed this percentage anywhere between 25 and 50 per cent, according to their locations. If, then, the druggist is selling this large amount of material at a very low yield, it is of vital importance that he know it—and know exactly and accurately just what this yield is. This will stimulate him to enlarge his profits here and there where opportunity presents and thus bring up the general average of profit throughout the whole business. It is this general average of profit, spread over a year's business, which determines whether a druggist is making enough money or not, and that druggist will never have the figures high enough who doesn't thoroughly realize what little, if any, margin is yielded him on a lot of things that he is compelled to carry in stock.

* * *

THE PERCENTAGE OF EXPENSE.

A discussion of much the same character arose last month at the meeting of the Nebraska State Pharmaceutical Association. The editor of the BULLETIN, who happened to be the guest of the association, read a paper entitled "Are You Making Enough Money?" The paper was founded on the assumption that most druggists did not know what their profits actually were; that ignorance of the real facts led them unconsciously to sell a good many things unprofitably; and that once they realized the exact condition of their business they would be in position to correct the situation. A system of records was suggested by means of which the facts regarding one's business and his exact profits could be easily determined.

Charles R. Sherman, like Mr. Mann, made the point that a lot of things have to be sold in the drug store which do not yield the average percentage of expense, but he argued that for the most part these things are really sold at a low cost and that the general percentage expense of the whole business does not properly apply to them. Thus proprietary articles or full boxes of cigars, for instance, can be handed over the counter quickly, and the sale closed with very little time or labor involved.

In department stores, where each depart-

ment is separately considered and given its own percentage of cost, the expense figures are of course found to vary greatly, but the small druggist cannot pursue detailed methods of this kind, and the most he can do is to see to it that his business as a whole yields him a gross profit considerably beyond his average expense of selling goods. If some things have to be sold at a close margin, well and good, but let him see to it that other things yield a big enough profit so that the general figures are brought up to a sufficiently high average.

* * *

THE NEW MILES CONTRACT.

Secretary Fernald of the Miles Medical Co. was present at the Michigan meeting and gave the members a short talk on the new Miles contract. In a word, the new agreement seeks to make the retailer the actual instead of merely nominal agent of the manufacturer, and to have the title of the goods remain with the manufacturer until they are sold. This device is based upon the minority decision of Justice Holmes in the Miles-Park case, and Mr. Fernald was very hopeful that it would prove valid if submitted to the test of court construction.

He argued that the Sherman law, as interpreted by the Supreme Court in the Standard Oil and Tobacco trust cases, leaves it to the courts to determine whether a given restraint of trade is reasonable or unreasonable, and that at the present time no one can really tell in any particular case just what decision will be rendered. He thought there was certainly no presumption against the success of the new Miles contract, and that Justice Holmes had pointed the way toward a valid method of protecting prices.

In the meantime the new contracts have been mailed to druggists by the Miles Medical Co., and everybody is congratulating the proprietors on their determination and on their loyalty to the drug trade.

* * *

MORE "CO-OPERATION."

Some little interest has been aroused by the formation of the "United Stores Association" in New York. Readers of coöperative literature would see at once upon reading the prospectus of this organization that the scheme is based upon several successful co-

operative enterprises in Great Britain, notably that of Rochdale. All sorts of retail stores are to be included in the plan, and it is reported that over 100 druggists in New York City have been approached.

The retail dealers who join the movement, however, will not be permitted to buy stock, but will simply be provided with a license costing them \$12.00. In return for the alleged benefits accruing to them, they will pay into the treasury of the Association a percentage on their total sales amounting to about 9 per cent on an average. Of this 9 per cent the company will pay 6 per cent to the consumers in the form of dividends on purchases, $1\frac{1}{2}$ per cent for advertising purposes, while the remaining $1\frac{1}{2}$ per cent will be utilized for the payment of the operating expenses and profit on the investment. This profit, be it understood, will go to the promoters of, and the stockholders in, the company, and these persons are neither the retail dealers nor the consumers, unlike the system followed with coöperative organizations of this character in Great Britain.

It remains to be seen whether druggists and other retailers will see enough in this scheme to warrant them going into it. It seems to resolve itself into the question of whether enough additional trade will be secured to justify the granting of an average discount of nine per cent on the sales. The BULLETIN OF PHARMACY has proved on many an occasion that the druggist's average net profit is only 10 per cent. Where, then, will he come in if he gives nine-tenths of this away?

* * *

DRASTIC ANTI-NARCOTIC REFORMS.

An act is now before the House of Commons of the Parliament of the Dominion of Canada which seeks to place drastic restrictions around the sale of morphine, cocaine, and their salts and compounds. Any druggist who gives, sells or furnishes the prescribed drugs to any person other than a duly authorized purchaser shall be liable upon summary conviction to a fine of \$200 and costs, or imprisonment for three months, or both. The sale is to be limited to physicians' prescriptions, and it is provided also that any physician who writes a prescription illegitimately for a narcotic will subject himself to the same penalties. Furthermore, any person who is

found in possession of any of the proscribed drugs, unless he happens to be one having a right to handle them, is punishable to the extent of \$500 or a year's imprisonment in jail. The same punishment will be meted out to those who seek to import the drug unless they have a right under the law so to do.

These are very severe prohibitions, but the Canadian officials have found them necessary. The usual laws merely restricting the sales to physicians' prescriptions and providing insufficient punishment, do not seem to have proved very effective. As to the prohibition upon physicians, it is interesting to note that in Philadelphia a doctor is under prosecution by the State Board of Pharmacy for having furnished prescriptions to "coke" fiends in the tenderloin district. Similar evidence has also been secured against several physicians in Pittsburg, and suits will soon be brought against them, if indeed this action has not already been taken.

* * *

THE LIQUOR PERIL IN INDIANA.

Governor Marshall of Indiana has interested himself in the violation of the liquor laws by druggists. The Governor has asked the State Board of Pharmacy to go so far even as to revoke the licenses of such druggists. He believes that money collected by the board could be spent in such prosecutions, but the attorney-general holds, on the contrary, that the funds of the board can be used only for enforcing the pharmacy and anti-narcotic laws, and that the enforcement of the liquor laws does not come under the jurisdiction of the Pharmacy Board.

It would appear that a number of "blind tigers" have been established throughout the State under the protecting cloak of pharmacy. Secretary W. H. Fogas, of the Board of Pharmacy, is on record as declaring that former saloonkeepers, denied the right of continuing their business as such, are following the method of opening fake drug stores, employing a registered man for the front of the store, and doing a thriving liquor business in the rear. In some instances this form of competition has mistakenly caused regular druggists in self-defense to sell more liquor, and thus conditions have become quite grave in certain parts of the State.

It remains to be seen just what the Board

of Pharmacy will do, or will find that it has power to do, but it is certainly to be hoped by every lover of the profession that the situation will be grappled with most earnestly.

* * *

A SCHEME THAT DIDN'T WORK.

Two young men have recently come to grief who sought to play a smart trick on the Kentucky Board of Pharmacy. A wanted to be registered, but he didn't think he could pass the examination, so he enlisted the services of B, who happened to be a licentiate of the Ohio Board, and who was presumably a pretty good student. B came before the Kentucky Board, registered in the name of A, and successfully passed the examination. In due time the certificate was issued and mailed to A, and A for the time being flattered himself that he had put one over on the Board and that he had become a registered pharmacist with very little trouble.

But his pipe dream was of short duration. The Board got next to the situation, put its attorney on the trail, and suit was at once brought against both culprits. There was nothing for them to do but to plead guilty, and both the principal and the "phony" were each fined \$100. They are now sadder but wiser men!

This sort of thing is occasionally attempted but almost invariably results in conviction and punishment. Some years ago the Pennsylvania Board unearthed several schemers of this sort. As the result of its recent experience, the Kentucky Board has now adopted what it calls "the county referee and photograph plan of identification" for all applicants.

* * *

USING UNREGISTERED CLERKS.

The organization of drug clerks known as the National Association of Pharmacologists, with headquarters in Columbus, Ohio, has become quite active in the enforcement of pharmacy laws regarding the employment of unregistered clerks. Largely through the instrumentality of the association, indeed, the Ohio act has recently been amended to read that a registered pharmacist must be "in full and actual charge of every store." This apparently leaves it to the courts to determine just how long the registered proprietor or manager may leave the store in temporary charge of the unregistered assist-

ant. A bill with a similar purpose was introduced in the Massachusetts legislature last winter, but aroused such opposition that it was killed. If we remember correctly, that bill would have compelled a registered man to be in attendance upon the store at all times, and it was fathered and supported by the pharmacy board. The National Association of Pharmacologists announces that it has deputed one of its members to travel through the State on the lookout for violations.

* * *

PRICE-CONTRACTS IN CANADA.

The decision of the United States Supreme Court in the Miles case, which all but did away with contract plans in the United States, has not seemed to cause any worry over in Canada. From an editorial in a recent issue of the *Canadian Pharmaceutical Journal* we learn that both the Canadian and the British courts have uniformly taken a different view regarding the right of the owner of a proprietary article to control the prices under which it may be sold.

Several decisions are on record to the effect that a condition printed on the invoice would hold good if the purchases were accepted with a knowledge of this condition. In other instances direct contracts have been supported, and injunctions have been granted where the contracts have been violated. More than this, at least one judge has ruled that retailers might combine and demand of manufacturers that they maintain their retail selling prices rigidly.

* * *

DR. GREGORY "WATCHED."

The twenty-fifth annual banquet of the Alumni Association of the Buffalo College of Pharmacy was held last month, and one of the interesting features of the occasion was the presentation by the Alumni Association of a solid gold watch to Dean Willis G. Gregory. It is always exceedingly gratifying when the present and former students of our colleges of pharmacy testify to their appreciation of the men who have presided over their institutions.

Oscar Oldberg, who recently retired from the deanship of the Northwestern School of Pharmacy after 25 years of service, has had conferred upon him the honorary degree of Doctor of Laws by Northwestern University.

EDITORIAL

THE NEED OF A FEDERAL ANTI-NARCOTIC LAW.

We now have fairly effective anti-cocaine and anti-narcotic statutes in the different States. In some instances they are not very well enforced, but the laws are there for purposes of reform whenever public or pharmaceutical sentiment develops in sufficient measure. Unfortunately, however, the efficacy of these State acts is very greatly diminished along the State borders, for in such places drug habitués, denied "dope" in their own town, find it easy to cross over into a near-by city in another State and get their supplies. Some unscrupulous druggists even go so far as to pander to this class of custom, and in quite numerous instances a profitable mail-order business is conducted.

The need is therefore apparent for a Federal anti-narcotic law which will stop up these leaks—which will effectively prevent the interstate traffic in narcotics. Illuminating proof of the necessity for such a measure is found in the last annual report of the Kentucky Board of Pharmacy. This Board, as we have mentioned in the BULLETIN on several occasions, has done excellent work in the eradication of the cocaine evil. In trying to correct the situation in Louisville, however, the Board found that its efforts were practically hopeless for the reason that fiends could get their drugs right across the Ohio River in New Albany, Ind. Nothing daunted, the Board straightway opened negotiations with the Indiana authorities in an effort to put a stop to the conditions.

The prosecuting attorney in New Albany was first appealed to. He expressed his willingness to be of help but declared that there were no funds for the employment of detectives and other assistants. The Kentucky Board promptly sent over the helpers who had been so efficient in securing evidence in Kentucky, and proof was soon secured of the illegitimate sale of cocaine. The evidence was placed before the prosecuting attorney, but on one pretext and another he excused himself for failing to begin prosecutions. Governor Marshall was even appealed to by the Kentucky Board, and correspondence was conducted with him for some time. He declared that he was very anxious to do whatever the

situation might demand, but nevertheless, for one reason and another, nothing at all was effected in the way of practical results, and the Kentucky Board in the end found itself helpless.

An efficient interstate law would step in when emergencies of this sort arose, and prevent the practical annulment of State laws under such circumstances.

TWO REASONS (?) WHY THE GRADUATION PREREQUISITE SHOULD NOT OBTAIN.

The *Western Druggist* has always been bitter in its opposition to the graduation prerequisite—so bitter, indeed, that its attitude has suggested more the biased partisanship of politics than the judicial discussion of a debatable subject. In a somewhat milder and more impersonal article than usual, it recently summed up its position in the following language:

The advocates of prerequisite legislation proceed on the assumption that the colleges have a monopoly of the work of education and without a college course no man can acquire competency in the art of dispensing. The professional standing of thousands of non-graduates of the past and of the present is proof of the fallacy of this assumption, but even conceding that it be warranted in a majority of cases, the exceptions today are sufficiently numerous to make the incorporation of such assumptions in State legislation a grave injustice. Moreover, these two considerations are a governing force:

First, any man desiring to enter the practice of pharmacy has a constitutional right, if qualified, to demonstrate his qualification before a board of pharmacy and to have those qualifications made effective by the receipt of a certificate of registration conferring the right to practice. Pharmacy laws are not made for pharmacists or for colleges, but for the protection of the public against incompetency in dispensing medicines. To the extent therefore that such competency is insured the public is protected and no pharmacy act can constitutionally go farther.

So? What about the constitutionality of medical, veterinary, and dental laws making graduation compulsory?

Second, prerequisite legislation means the subordination of the Boards of Pharmacy to those colleges which under such legislation may dictate to the boards whom they may or may not accord the privilege of an examination. In other words, private institutions are given power over the representatives of the people on the Boards of Pharmacy, thus surrendering the public interest to private interest—a perversion of legislation not to be tolerated in a free country.

On the contrary, the college will have less authority and the board more, for the board, as a part of the executive machinery of the

State, will have power to demand that the college conform to the requirements, and the college will have to come up to the scratch or go unrecognized. The boards will hold the whip hand—not the colleges.

Our Chicago friend will have to produce better arguments than these if he expects to kill the prerequisite movement.

"PEOPLE WON'T CROSS A STREET."

Some surprise was exhibited when the new Riker-Hegeman combination in New York established a store on the opposite corner within half a block of the big Hegeman pharmacy at 200 Broadway. To the average man this looked like competing with oneself. The incident is used as the text of a very interesting article by Thomas E. Dockrell in a recent issue of *Advertising and Selling*. Mr. Dockrell points out that shrewd merchants have long since made the discovery, and have established it as a law of human nature, that in large cities people will not cross a street to buy goods. In the hustle and bustle of the modern era time is too valuable!

This principle of course applies more particularly to men. It is fair to presume that women are natural shoppers and would rather put themselves out than not. But in stores which cater exclusively to men, like the United Cigar Stores, for instance, it has been found necessary in crowded districts, where the traffic is enormous, to have shops directly across the street from each other, and sometimes even on opposite corners. It was this law of human nature—or at least of masculine nature—that dominated the establishment of a second Riker-Hegeman store so near the big one at 200 Broadway, and apparently the new place has built up its own trade successfully without taking any business at all from the other one.

INSURANCE CARELESSNESS.

On several occasions recently we have pointed out the folly exhibited by many druggists in failing to protect themselves fully against fire. It is probably rare for a pharmacist to have no insurance at all, but it is quite customary to have too little. Here are three letters received within two or three days of each other by a large house from creditors who had suffered fire losses:

GENTLEMEN:—Yours received and I note what you say. Just returned on June 6 and found my store in ashes. It was burned on the night of the 5th, and I had no insurance. Everything a clear loss—something like \$5000. Am in this world without a dollar, and will ask you to bear with me for a while. I will pay this bill, but will have to have a little time. As to what I will do I cannot say. I haven't anything to do with. Hoping this will be satisfactory with you, I am, yours respectfully.

GENTLEMEN:—I am very sorry to inform you that my store was completely destroyed by fire about 5 o'clock Tuesday morning. I have \$3,500 insurance, but will lose as much as \$2,500. I will have to ask you to wait for what I owe you until I can get my insurance adjusted, but I assure you I will pay you every dollar with interest. If you can grant me this favor, I will certainly appreciate your accommodation.

Yours respectfully.

GENTLEMEN:—In regard to the note you hold against us for \$100 due on the 3d, will it be convenient for you to carry this a few months longer, charging us interest on it?

You are probably aware of the fact that we have suffered a severe fire loss and have not yet gotten back in business again. We have been at considerable expense fitting up our new place and right at present need all the funds we have on hand, hence will consider it quite a favor if you will hold the note over awhile.

Awaiting your favors, we are,

Yours very truly.

These letters tell their own story without necessitating any comment. In no case was there enough protection, and in one case there was none at all. In all three instances the druggists were subjected to a good deal of sacrifice, and, what is equally important, they had to hold up their creditors for an indefinite length of time.

GOT ANY GOOD SHOW CARDS?

One of our most interested readers makes the point that we have not published enough material in the BULLETIN on the subject of card writing, and his criticism is doubtless correct. We have had occasional articles on the subject, and some of them have gone into detail and have been quite elaborate. But after all we have not begun to exhaust the topic, and we should like very much to get specimen show cards from our readers for reproduction in the journal. By this method one druggist can see what other druggists are doing, and we can carry out our purpose more effectively of making the BULLETIN a real medium of exchange between our readers. Send along show cards and signs of which you are particularly proud!

THE HALL OF FAME

PROFESSOR COBLENTZ IN THE LIME-LIGHT.

We are showing this month a new portrait of Professor Virgil Coblentz of New York City. Professor Coblentz has figured very strongly of late by reason of the attacks made

VIRGIL COBLENTZ.

by the *New York World* upon many of the druggists of that city. The drugs collected by the *World* were turned over to Professor Coblentz for examination and the analyses were made by him or by others whom he asked to cooperate with him.

FORTY-THREE YEARS IN HARNESS.

E. B. Heimstreet of Palmyra, Wis., has had a long and active career in pharmacy—a career lasting over forty-three years. Most of this period was spent in Janesville, Wis., but desiring to return to the simple life Mr. Heimstreet two or three years ago moved to the small town of Palmyra, a beautiful village near Milwaukee, where he established himself in a very neat store. He avers that the next twenty years of his life are very largely to be years of pleasure, in which fishing, boating

and the raising of pets will figure conspicuously.

Back a generation ago he was the prime mover in organizing the Rock County Pharmaceutical Association, and he was secretary until he left Janesville. It was he, too, who issued the call that resulted in the formation of the Wisconsin Pharmaceutical Association in 1880, and he has been secretary ever since except for a period of about five years when he thought he would let somebody else do the work. Long a member of the State Board of Pharmacy, he was secretary also of this body for upwards of twenty years. He was instrumental in the enactment of the State phar-

E. B. HEIMSTREET.

macy law. Much interested in the subject of cooperative druggists' insurance, he is a director of the American Druggists' Fire Insurance Co., and has charge of the Wisconsin interests of this organization. Of the Wisconsin Pharmacal Manufacturing Co. Mr. Heimstreet is, and from the first has been, the secretary; and from first to last he seems to have been one of the central figures in every movement affecting the interests of the pharmacists of Wisconsin.

ONE BACHELOR WHO KNOWS HOW TO BE COMFORTABLE.

When we decided to print in the *BULLETIN* a series of pictures illustrating the residences of well-known druggists, we asked E. H. Ladish for a photograph of his home, not knowing at the time that he had never entered into the matrimonial state. Nevertheless we got the picture, and we found at least one bachelor who in the absence of a wife knew how to provide comfort for himself. In mail-

ing the photograph, however, Mr. Ladish was very anxious that we should not arrive at false conclusions, and he went out of his way to explain that the children shown in front of the house belonged to the man in a neighboring apartment. He went on to say that

E. H. LADISH.

his own family comprised "my housekeeper, my dog Skipper, two canary birds, and Jim the alligator."

Mr. Ladish's apartment is on the first floor of the first building shown in the series of "brown stone fronts." The library is the

Mr. Ladish's apartment is in the first building.

room indicated by the bay window on the side. After this published description of Mr. Ladish's home comforts it is possible that he may be besieged with matrimonial applications, but we vigorously protest that we had no such object in mind in printing this article.

We may say, however, that Mr. Ladish, though he has sold his prosperous drug store in Chicago, is financially interested in a number of other enterprises. He was for two or three years a member of the Executive Committee of the N. A. R. D. His opinions are always sound, and it is for this reason that we are reprinting what he said recently about the BULLETIN OF PHARMACY: "You are making a very attractive monthly of your paper. Always something new. Well, what's the use of having plenty of gray matter and not turning it to good account?"

ONE OF THE PIONEERS.

If we mistake not, the first one of the co-operative insurance companies to be organized in pharmacy was the Retail Druggists' Mutual Fire Insurance Co. of Ohio, with headquarters

JOHN WEYER.

in Cincinnati. The success of this organization paved the way for others which have since followed from time to time. We are presenting this month a portrait of Mr. John Weyer, of Cincinnati, the secretary and general manager of the company, and the man who, more than anybody else, is responsible for its success. Incidentally it is worthy of note in this connection that Mr. Weyer was a member of the first board of pharmacy appointed in the State of Ohio. He served from 1884 to 1895. At the present time he is 73 years old.

William B. Day, Chicago, secretary Illinois Pharmaceutical Association.

J. W. Gayle, Frankfort, secretary Kentucky Pharmaceutical Association.

Clarence Bowmer, Providence, secretary Rhode Island Pharmaceutical Associ'n.

Robert Lowman, Pittsburg, secretary Kansas Pharmaceutical Association.

E. F. Kelly, Baltimore, secretary Maryland Pharmaceutical Association.

J. W. McArthur, Spokane, secretary Washington Pharmaceutical Association.

G. O. Young, Buckhannon, secretary West Virginia Pharmaceutical Association.

E. C. Bent, Dell Rapids, secretary South Dakota Pharmaceutical Association.

Herbert E. Rice, Nashua, secretary New Hampshire Pharmaceutical Association.

Secretaries of some of the State Pharmaceutical Associations—The Men Who do the Work!

This is the store of the William Haughn Drug Co. in Casey, Ill. Mr. Haughn himself is standing behind the counter at the right, while his partner, Mr. Chenoweth, is behind the counter on the left side of the store.

J. P. Eckers, at the corner of 27th and Prospect Streets, Kansas City, Mo., has a successful business. Witness the attention paid to soda customers—*i.e.*, the tables down through the entire center of the salesroom.

The stores in Central and South America are quite interesting. Here is one located in Santa Ana, Salvador. The proprietor is Federico Vides.

C. E. Robertson is proprietor of the "Blue Front Pharmacy" in Carthage, Ill. The town has 3000 inhabitants and Mr. Robertson does a hustling business.

This is the store in Alexandria, La., of John F. Conrad, Ph.C., who is seen standing at the left, and who is an alumnus of the School of Pharmacy of the University of Michigan. Mr. Conrad does a fine prescription business.

L. W. Randolph is the proprietor of this store in Plainfield, N. J. The place was evidently decorated on the Fourth of July or some other patriotic occasion. P. A. Minton, a frequent BULLETIN contributor, is chief prescriptionist in this store.

The exteriors of the pharmacies in South America are quite different from those in this country. Witness this view of the "International Drug Store" in Santiago, Chile, owned by Curt Carliczek.

The interior of the Chilean store shown across the column is equally interesting and suggests a large trade and a high class of patronage. The atmosphere is quite professional in character.

Francisco Javier Cajiao is the proprietor of a pharmacy in Bogotá, Colombia, and the young man himself is shown at the left of the present picture. He is a physician and surgeon as well as a pharmacist, and is well known throughout Colombia.

This is another view of Dr. Cajiao's pharmacy, in which the monthly sales amount to something like \$3000. The products of the pharmacy have been awarded a prize at one of the national expositions, and there are several branches of the establishment.

Here we have an interior view of the "Corner Drug Store" of E. W. Austin, which is located in the town of Midland, Mich. Mr. Austin himself is presumably the gentleman standing at the right of the picture.

This beautiful and unique pharmacy was established in the Hotel Astor in New York City some time ago by Frederick K. James. We had more or less to say about the store in the April BULLETIN.

[Picture made especially for the BULLETIN OF PHARMACY.]

Druggists Photographed in Their Stores.

5. Henry C. Blair, Philadelphia, Pa.

Joseph W. Errant,

Who, as attorney for the N. A. R. D. throughout its entire existence, has successfully steered the organization over many shoals and clear of numerous breakers.

"How I Spent My Vacation."

This is the second installment of travelogues that have appeared in the BULLETIN. Our readers will be all the more interested in these narratives because they tell of the real vacation experiences of pharmacists. Every summer any number of druggists are in the habit of leaving the store for a tour to the seashore, the woods, or the mountains, and these articles will give our readers some idea of the scenery and life that the travelers observe. One writer describes a trip to Kentucky. Another carries the reader into a wild and rugged section of Canada. A third traveler briefly tells of his sojourn on the gulf coast. We present these vacation stories in the hope that they will stimulate other druggists to take annual outings.

A TRIP INTO KENTUCKY.

BY W. S. WHITELEY, VERONA, PA.

A couple of years ago I whiled away the long winter evenings back of the prescription case reading the life of Daniel Boone, a rather juvenile edition at that. But I derived a lot of pleasure from it and subsequently profit, as this narrative will show.

In the course of my reading I ran across a paragraph depicting the merits of a famous spring at Harrodsburg, Ky. I had always been interested in the magic name, Kentucky, and here was my opportunity to visit that country on my next vacation, making the springs my objective point. The book was read and laid aside, but not the plan of travel, which was stored away in one corner of my brain till I could get away.

THE START.

That time came about the middle of July, and I boarded a train for Cincinnati, where I arrived the following morning. I had just time enough to breakfast in the dining-room of the station before taking the train which crosses the river into Kentucky. Thence I traveled through the beautiful blue-grass region dotted with its fine farms and cattle on a thousand hills, over High Bridge and on to Danville, where I arrived about noon. I visited many points of interest in Danville that afternoon. It is one of the oldest cities and the first capital of the State. The first surgical operation known as ovariectomy was performed in this city. The State university was located there, situated in a beautiful place, and many fine streets and grounds were to be

seen. Here I changed my programme somewhat, as I was told that Crab Orchard Springs was the Mecca of most pilgrims to Kentucky. I therefore deferred my visit to Harrodsburg till my return. The next morning I started for Crab Orchard, being driven to the junction by a gentleman who was going that way and offered to take me in his rig.

I reached that village at about noon and found the hotel to be about a mile from the springs. On the following day I met Mr.

Steamer "Falls City" passing High Bridge.

White, the owner of the springs, who cordially invited me out to his place. I accepted the invitation, and was highly entertained as he took great pains to show me his place and manner of conducting business at the springs, where he bottles the famous Crab Orchard water. He drove me home by way of the old Whitley mansion, the oldest brick house in Kentucky, built in 1783 of brick carried from Virginia. The woodwork was hewn and carved on the spot. The bricks were black and red placed alternately. The walls were nearly

two feet thick, and the woodwork all hand-carved with ornamental features. For example, carved upon the side of the main stairway were thirteen eagles representing the thirteen colonies. The great fireplace was surmounted by a mantel and woodwork reaching to the ceiling. Deep cupboards occupied either side. The partitions were entirely of wood.

Boone's cabin, High Bridge, Ky.

The outside doors were particularly strong, being composed of a sheet of iron with boards fastened on either side. The windows were not very numerous and were of the small-pane pattern. All the woodwork was of the finest of hardwood and in the best of condition. To all appearances it was good for another hundred years.

We were pointed out the rack upon which Colonel Whitley kept his trusty rifle, with which he fought at the battle of the Thames, in which battle he was killed. The rifle and powder-horn we inspected at the home of his great-granddaughter in the village of Crab Orchard. The powder-horn was richly carved with the following lines:

Wm. Whitley, I'm your horn!
The truth I love, a lie I scorn.
Fill me with the best of powder,
I'll make your rifle crack the louder.
Now hear the dread terrific ball,
Make Indians bleed and Tories fall,
You with powder I'll supply,
To defend your liberty.

Quite a poet, was he not, of the rough old backwoods time?

THE JOURNEY HOMEWARD.

The shadows of the late afternoon were casting long figures upon the lawn as I turned into the hostelry for the night, well satisfied with

my adventures of the day. Returning homeward I stopped at Harrodsburg, which was one of the first three settlements of Kentucky, the other two being St. Asaphs (now Stanford, near Crab Orchard), and Boonsboro. Harrodsburg is beautifully situated, and I spent a very pleasant day there looking up historical points, such as Harrods Fort, etc. I started the next morning for Lexington, driving as far as High Bridge, a distance of eight miles through a highly cultivated region, passing an old Quaker village with a few stone buildings, old mill, etc. We approached the Kentucky River by descending a steep gorge to an old-time ferry. The ferryman we had to call from the opposite shore.

Here I dismissed my driver, and crossing the river, climbed the hill to the hotel. I visited the park, where I saw Daniel Boone's cabin and scenery of striking beauty. I then took the train for Lexington, which in itself is a delightful city; but when you consider the many drives that are to be taken around and about the place, it makes a most interesting spot to visit. I drove to the Patch and Wilkes stock farm. The road led by Henry Clay's old homestead, a beautiful old country seat. Driving through gates and across wide fields

A Kentucky tobacco field.

was no small feature of the interesting trip to the stock farm. Here we were well repaid for the long distance traveled, by being permitted to gaze upon "Peter the Great," a famous horse which has been coveted by foreign governments, but no money can buy him.

In an adjoining barn were two hundred yearlings. So courteously is the visitor treated that these are led out one at a time for his inspection. The truth did not dawn upon me until two or three had thus been led out, when

I called a halt and requested that I be allowed to walk past the stalls, explaining this would amply satisfy my curiosity. I was no judge of horse-flesh anyway. That was done; and from blacks, bays, sorrels, grays, roans, etc., it would be hard to choose. The dilemma was nicely dispelled when we came to the last stall, where the attendant opened the door. Out

The largest barn in the world for trotters.

leaped two Russian greyhounds, which took a run up the lane, enjoying their freedom.

Returning to High Bridge I put up for the night, taking the boat next morning for Louisville. And what shall I say of the delightful scenery of the Kentucky River? It certainly rivals that of the Hudson and I will leave it to your readers to see it for themselves. Suffice it to say that I arrived at Louisville in due time, spending a day there and coming to Cincinnati by boat the same night on my journey homeward.

A SUMMER STAY AT LION'S HEAD, ONTARIO.

By S. C. COOPER, PH.M.B.

"Thank God for His fresh air," I exclaimed as the stage swung to the left on the white dusty road, and a cool northern breeze from across the blue waters of Georgian Bay fairly slapped us in the teeth. From a vantage ground of about two hundred feet we could gaze across Colpoy's Bay, and as the stage progressed and lurched the beautiful panorama continued changing. On the other side of the bay, like a map of the United States, lay here a field of yellow wheat with scarcely discernible glints of gold, and there a square patch of greenish-yellow inset with a darker square yet to fall prey to the mower-knife. Farm-houses and barns dotted the

landscape. Two or three white churches and a little hamlet lent their interest. A white vessel, called by one of our passengers *The City of Meaford*, was steaming up the bay, leaving wreaths of black smoke in her wake. A tug towing a barge laden with lumber met and hailed her and received a shrill reply. Rocks, poplars, and evergreens were on the slope, while to the right and behind us the buzz of sawmill and factory resounded.

I was off for my holidays. I had had enough of Atlantic City the year before. I thought the soft green turf would be more attractive than the Boardwalk. I was sick of piles of stone and mortar, the clank of trollies, the shrieks of locomotives, the honks of autos, and the hurry-scurry of sweating humanity. I expressed my sentiments to Jack Osmond: "Jack, I want to go somewhere where people are scarce, natural, and simple-lived; where one can see a twenty-mile stretch of the earth as God made it—stones, rocks, trees, birds, and animals; where I can fish a little and loaf a lot; where I can keep cool in the daytime, and comfortable at night, pray when I feel like it, and curse when I've reason to."

Jack slapped me on the shoulder, and with

Point Hangcliff or Lion's Head, Bruce county, Ont.

a hearty laugh ejaculated, "I've got your measure, old fellow. Go to Lion's Head for the next three weeks, and if you don't eventually eat like a horse, sleep like a winter bear, fatten like a spring squab, and tan like an Indian, I'll do something desperate. You'll be twenty-two miles from a railroad, the G. T. R. at that. You'll get any amount of good air, good food, good sport, and good thoughts." We laughed together. He gave the directions, and a few weeks later I followed them.

A RIDE ON A STAGE COACH.

The slow, dirty coaches, smelling internally of stale tobacco smoke and coal smoke annealed, assimilated, and veneered until the last stink of that smoke was worse than the first, appropriately heralded by an unearthly screech from the locomotive, careened over

Natural bridge at Lion's Head.

the rails down the long grade into the lake-split town of Wiarton.

Our stage journey was bordered with rugged attractions. The Bruce Peninsula, I am told, has given and nurtured some solid families that have been a credit to the county of Bruce. I could understand that the Hon. Alexander McNeill, from his eyrie at Colpoy's, should think and read and strengthen his prophetic vision upon the globe-encircling policy of Imperial Federation. I could understand that Mr. Wilfred Campbell, as he gazed into the blue-reflected depths, should sing as though his throat should burst with song. The beauty, the ruggedness, the boldness of it all! Here, crofters' patches of land with uninviting huts; there, fine brick houses encompassed by broad rich acres; further, the blue water again verged by high precipices, and then the rich, rank-smelling underwood. That three hours' stage-ride to Lion's Head, despite the absence of shock-absorbers and the ruts and rocks encountered, remains one of the most beautiful pictures of my memory. That night I prayed and thanked God that he had a back yard and that he had turned me into it, lit by the stars, swept by the winds, washed by the rains and warmed by the sun. And with my window open, after turning out my electric light, in comfort and quietness I slept, and slept, and slept.

Every village has its earmarks, its landmarks, and its characters, and Lion's Head abounds richly in all. The village is named after a bold headland that less than fifteen years ago from a certain point gave the profile of a lion's head. Later the lower jaw fell and spoiled the attraction. It is also named Point Hangcliffe. The village, nearly three miles away, encircles a spur of Isthmus Bay, and a very presentable harbor has been formed. On the north shore is the Natural Bridge; also D  ad Man's Cave, in which the skeleton of a man "who could tell no tales" was found many years ago. At the summit of the ridge on the north side of the harbor are depressions described by the Cape Croker Indians as graves of warriors slain in a bloody Indian battle beside the water, and later rifled for relics for city museums.

Along the south side of the bay is a huge rock called Eagle's Nest, because an eagle had its nest many years on the side of it; and Sunset Cave in the bayward side of it penetrates about twice the length of a rowboat, the cave being as cool as a refrigerator in the hottest day of summer. I drove north to Miller Lake, where I caught twenty-six large pike,

Scene at Barrow Bay.

and lost three hooks by their cutting the line with their sharp teeth, in less than an hour.

GOOD FISHING.

I spent an afternoon near Stoke's Bay on the Lake Huron shore, and hooked fifty-two black bass for my trouble. While driving back to Lion's Head I passed through the low woods, and just before sundown counted eleven wild rabbits that scampered across the road before me at sound of the patter of my horse's hoofs. That is another picture that remains with me—the scent of the woods, the

red sunset, the long shadows, the awkward jumps of the hares, the patter of the pony's hoofs, the white moonlight, the shadows of horse and rig and tree-tops upon the dusty road, the awakening of a cool, damp, refreshing breeze, the twitter from distant frog-swarmed marshes, and the natural loneliness; then upon emerging into the farming settlement, the scent of new-mown hay, and the recently milked herd chewing the cud of passive contentment.

Such trips were alternated by whole days spent in trolling on Isthmus Bay. And whether seeking bass, or pike, or mountain trout, or speckled trout, or salmon trout, each in its respective haunt, Nature grudged not her treasures. Stealthily we rowed along the north and south margins, guiding the boat so that the lake-bed might be visible from one

Stoke's Bay: The Rapids.

side of the boat and invisible from the other, at a speed sufficient for the revolving spoons to keep taut less than a hundred feet of fishing-line. Next to hauling into the boat a sixteen-pound salmon trout, perhaps most enjoyable was eating the flesh, uncontaminated by handling, by shipment, by exposure, and by age.

I could go on writing for a week telling events, traditions, aspirations, and current topics of this little burg. I could tell of the large brown bear I killed. But a settler shot three this season, and hardly ever refers to it unless the details are catechized out of him. I have said enough for the present, but to any one who wishes to have a holiday of the nature I have described, to have cool breezes in July and August, Norwegian scenery to rest

the eye and feast the imagination, a continuous round of sport on land and water, and the homely comfort of a fifteen-thousand-dollar hotel, all "far from the maddening crowd's ignoble strife," and at a minimum of expense, to such a one let me say: "Spend your next summer vacation at Lion's Head!"

ON THE GULF COAST.

BY JEWELL A. STILL, ARKANSAS CITY, ARKANSAS.

My vacation last summer was a most pleasant one, being spent on the Gulf of Mexico. The city of Port Arthur was the headquarters of my whole stay.

To me the most interesting places in the country were the oil wells and the Gulf itself. The country is lined with clam shells which make the finest of roadbeds. Many street walks are also made of this material. The depots are all like the old pioneer stations. In other words, they are like we imagine the Mexicans, and to go back we may say the Aztecs. A considerable number of the original Mexicans dwell in this country.

Any who have ever been on the coast may know that the Gulf looks like a mountain—that is to say, the water seems to get much higher with the distance. The mosquitoes are so thick as to almost stifle people who are not used to them; frequently they kill cattle and sometimes bore the natives considerably. At any rate they put me to a great amount of unnecessary annoyance. We were allowed to go aboard a battleship, which is always a real treat to most people in the Middle West.

The largest or one of the largest oil wells in the whole country is located in Port Arthur, Texas. We noticed several up-to-date drug stores in this and other towns, all of which seemed to be doing a good business.

We were allowed to accompany a fishing expedition which consisted of about a dozen men and a new sailboat. A fish known as the toadfish was the chief attraction. As you may imagine, toadfishes are funny looking creatures. Every time one is caught he swells his sides just like our ordinary toad. The expedition lasted ten days. Those who took part in it say they were well paid for their time and trouble and will go again.

THE NATIONAL ASSOCIATION OF BOARDS.

What it has Endeavored to Do—What it has Actually Done—What the Future Holds Out for It—A Story of Good, Honest, Necessary Work Well Performed for the Betterment of American Pharmacy.

**By ERNST O. ENGSTROM, Pittsfield, Mass.,
President of the National Association of Boards of Pharmacy.**

I am afraid I may tire you if I should write all the good things I know about the aims and achievements of the National Association of Boards of Pharmacy. Consequently I shall try to condense it as much as possible, but will try to make clear the objects and history of this excellent organization.

ORIGINAL PURPOSE OF THE ORGANIZATION.

In accordance with a resolution passed at the Mackinac meeting of the A. Ph. A. in 1903 a conference of delegates from the various State boards of pharmacy was called together the next year at Kansas City under the chairmanship of George Reimann of Buffalo. At an informal meeting a committee was appointed to suggest subjects for discussion by the conference, and the committee reported as follows:

We suggest an exchange of certificates between the States based upon the following propositions:

First. Examinations to be uniform so far as possible.

Second. The organization of a national conference to consist of a delegate from each State board, said conference to convene annually during the meeting of the A. Ph. A. to consider the general work of the year.

Third. We suggest a definite standard of requirements for colleges of pharmacy. (This I will pass over as it is not within the scope of our work except as it pertains to the Syllabus Committee.)

Fourth. We would urge the requirement of three years' practical experience in a retail drug store, where physicians' prescriptions are compounded and dispensed under the supervision of a registered pharmacist; or graduation from a recognized school of pharmacy.

As was expected, the report developed a long and at times heated discussion. After some hours a number of the delegates present feared that it would be impossible to find sufficient ground for all present to stand upon with entire comfort and harmony; but it was evident throughout that all were sincere in their desire to attain the object of the meeting, and in the end there was reached a unanimity of opinion which was most gratifying.

Attention is called to the fact that thus far the action of the conference was wholly informal. The free exchange of opinion on the part of the delegates present, together with their sincerity, persistence, and patience, made it evident that the conference had not been in vain, and it is noteworthy that it was at this point that the decision was reached to effect a permanent organization. A constitution and

E. O. Engstrom.

by-laws were unanimously adopted on September 8, 1904. Twenty-six boards of pharmacy were represented by one or more delegates, and Mr. M. Bernstein, Shreveport, Louisiana, acted as secretary. The association must thank Dr. Murray Galt Motter for the preservation of the records of this meeting, as I do not believe there is more than one copy in existence, which I obtained through Ernest Berger, Tampa, Fla., this year.

The second annual meeting of the association was held in Atlantic City and the general organization was completed. Dr. Motter read

the constitution and by-laws by sections and recommended some changes and amendments which were unanimously adopted. Committees were appointed to work for the interest of the association. George Reimann presided at this meeting and E. C. Bent of South Dakota acted as secretary in the absence of Mr. Bernstein. I. A. Keith of South Dakota was elected president, and Ernest Berger of Florida was elected secretary. The committees thus far named were the Executive Committee, the Committee on Legislation, and the Committee on Compilation of Pharmacy Laws.

GUIDING PRINCIPLES.

The third annual meeting was held at Indianapolis and 11 active and 12 associate members were reported among the boards. At this meeting it was first decided that a report of the proceedings should be sent to each board of pharmacy. In this manner the aims and objects of the association would become more widely known. The Syllabus Committee was established, Wilhelm Bodemann of Chicago was appointed as the association's representative on this committee, and the following recommendation was adopted:

1. All laws and regulations governing the licensing of pharmacists should make due distinction between apprentices, clerks, and principals, and should establish definite minimum qualifications and indicate the rights and duties of each of these three classes of pharmaceutical workers.
2. No person should be licensed to practice as an assistant pharmacist who has not attained the age of 18 years.
3. All candidates for license to practice pharmacy should be required to pass such examination as may in the opinion of the board of pharmacy be deemed necessary, but all candidates should be examined upon their ability to correctly read and dispense prescriptions.
4. A preliminary general education of not less than a grammar school graduation should be required as a prerequisite to the pharmaceutical experience or apprenticeship required for the licensing of registered pharmacists or assistant pharmacists.
5. In the determination of the fitness of any applicant to receive a license to practice pharmacy all important facts of his educational history, practical experience, and technical services should be taken into account, including his preliminary general education, his special education in pharmaceutical and other related technical schools, his practical experience in pharmacy and the result of the examinations he has passed, and an average of these three general factors, each assigned its appropriate value, should be adopted as the passing grade.
6. Definite and uniform conditions of efficiency should be adopted which all pharmaceutical schools must comply with in order to receive recognition by

the Board of Pharmacy, and in all cases where students and graduates of such schools receive credit in any form for the courses they have completed or for the time of attendance at such schools, these conditions of efficiency should be made public and should be applied equally to all schools. The conditions of efficiency prescribed for the recognition of schools of pharmacy should relate solely to matters affecting the character of their educational work.

7. Special education for the practice of pharmacy is in this age a necessity and should as rapidly as possible be made compulsory, and the rules of the Board of Pharmacy should be such as to promote and encourage it in all practicable ways. The special pharmaceutical education should include substantial laboratory courses.

8. A Syllabus of Pharmacy Examinations should be prepared which shall indicate the subjects to be included in the board examinations as well as in the courses of instruction in the pharmaceutical schools, with the view to the attainment of a reasonably uniform standard of minimum requirements which may be adopted.

9. It is recommended to all concerned that the foregoing principles and standards be adhered to in any amendments to the pharmacy laws hereafter proposed in order that national uniformity may be ultimately attained. The minimum requirements indicated, and especially the preliminary general education, should be increased from time to time as circumstances permit.

10. It was further strongly urged that the Boards of Pharmacy employ the discretionary powers already theirs under the existing laws to improve the educational status of the pharmacists of the future.

WORK DONE FROM YEAR TO YEAR.

The association also adopted a recommendation declaring that the various State boards which interchange certificates should recognize the pharmacists of the U. S. Navy and the Public Health and Marine Hospital Service as entitled to receive the same privilege in the matter of interchange of licenses as was accorded to the licentiates of the various States. It was also recommended that all boards belonging to the association provide for an interchange of certificates of registration whenever compatible with existing laws, and that where present laws did not admit of such interchange, endeavors should be made to secure amendments making a general exchange possible.

A committee on Questions and Methods of Examination was appointed whose duty it was to prepare and submit a set of questions in the several branches of study. Such questions were to be regarded merely in the light of suggestions and guides, and it was hoped that the labors of this committee would bring about a greater degree of uniformity in the examinations of the several States.

At this meeting G. C. Diekman, of New York, acted as secretary *pro tem.*; F. C. Godbold, of Louisiana, was elected president; and Mr. Diekman was elected secretary.

The fourth annual meeting was held in New York, and the same earnest desire to improve examinations was manifest. The several States reported through their delegates present that in the majority of cases great reforms had been introduced in the character of examinations and in the methods of conducting them. Dr. Wiley of Washington, D. C., was present at this meeting and was so impressed by the earnest discussions that he strongly commended the delegates present for the good work they were doing. F. A. Hubbard, of Massachusetts, was elected president, and A. F. Sala, of Indiana, was elected secretary.

The fifth annual meeting was held in Hot Springs, Arkansas. The Committee on Questions and Methods of Examination deviated from the work previously done by the committee, and instead of reporting sample questions suitable for examination presented a report which showed exactly what each State board was doing, and which included three or four hundred questions picked from written examinations. This enabled every member to see what the actual requirements were in the different States. A table printed on page 22 of the report of this meeting was of great help to the members. It was here decided that an average of 75 per cent should be attained by the candidate who expected to secure a reciprocal certificate in another State.

Among other things done were the following:

The association strongly indorsed such practical work as the dispensing of prescriptions and the manufacture of pharmaceutical preparations in all examinations, and it was urged that all boards take measures to include this in their requirements.

A new set of application blanks for candidates who wished to obtain reciprocal certificates was drafted at this meeting.

The establishment of auxiliary branch associations of the National body, to include three or more States bordering on each other, was recommended.

Four years' practical experience in a drug store was adopted as a minimum prerequisite to a certificate of registration in pharmacy.

F. B. Lillie, of Oklahoma, was elected presi-

dent, and A. F. Sala, of Indiana, was elected secretary.

INTERCHANGING CERTIFICATES.

The sixth annual meeting was held in Los Angeles, California. This was the first year the secretary was able to report how many certificates had been sought and secured through the National Association rules, and the table given on page 13 of that year's report shows the number to have been 177. The president urged the need of assistant registered pharmacists and stated that the number of fully registered pharmacists was too great. He recommended five years of practical experience and a higher standard for the examination of a fully registered pharmacist, and the issuance of certificates as qualified assistants in all cases where these higher educational requirements were not fully met.

The Committee on Questions and Methods presented the written answers given by a candidate who had passed an examination before a board of pharmacy. The committee requested the members present to mark the answers and grade them according to their best judgment. This experience proved that the markings differed and ranged from 69 to 82 per cent, with an average of 73 5/6 per cent.

Since the last annual meeting several auxiliary associations had been formed. John D. Muir, of Michigan, was elected president, and A. F. Sala, of Indiana, was reelected secretary.

The seventh annual meeting was held in Richmond, Va., in May, 1910. Six standing committees, doing good work during the year, submitted reports, and a sample examination for registered assistants was submitted. In the eight months which had elapsed since the last meeting, 157 certificates of registration had been granted through the reciprocity plan established by the National Association, showing a slight gain over the previous year's report.

Some of the States which had not previously reported how they conducted their examinations gave complete data and submitted questions which they had used.

Other members reported changes and improvements. By retaining the reports of the proceedings of the association from year to year every board of pharmacy can easily determine what the standard of examination is in any State.

WHAT THE BOARDS HAVE ACCOMPLISHED.

I have now given a short history of the proceedings as reported from year to year, and I can truly say that the first object of our association has been fully established. That is: *"The interstate reciprocity in pharmaceutical licensure based upon a uniform minimum standard of pharmaceutical education."*

More than this, the development of proper examination methods in many States is undoubtedly due to the influence of our association. The first and second annual meetings brought out the fact that slipshod methods had been practiced in many States. Certificates had been granted without thoroughly testing the candidates' fitness. Were it not for the character of the members taking part in the deliberations, and the evident desire of each to improve his own standards and to help others to improve by offering the right kind of suggestions, I question if the association could have accomplished as much as it has in the short time it has existed.

When I read the criticisms of men in the drug journals I am reminded of an instance where one of these journals printed an examination paper as having been used by the Massachusetts Board of Pharmacy. I knew that such an examination had not been given by our board during the three years I had been a member of it, and some of the questions pertained to the U. S. P. 1890. I wrote the editor of the journal, telling him that the publication of such questions would give a wrong impression of the up-to-date methods employed by our board, and would give the critics good reason to shout that "obsolete questions are asked by the boards of pharmacy." I received a reply admitting that the examination was undoubtedly several years old, and congratulating me on being able to see that the questions were obsolete in character.

The National Association of Boards of Pharmacy now has 36 members who look upon the annual meetings of the association as a place where ideas are presented for the betterment of board work.

Our organization has become a clearing house for improved methods in board examinations. At our yearly experience meetings the interest is intense, and every delegate is found in attendance. When our deliberations are over it is with a feeling of satisfaction that something new has been learned.

The points for betterment of the work which the delegates are able to take home to their respective boards have well repaid them for the time and expense.

We are progressive, adding something every year. Last year a Committee on Legislation was made one of our standing committees. The information this committee will furnish will help us all in making out our annual recommendations to our respective State authorities. No State board of pharmacy can afford to remain outside of the organization, and not one of them can escape its influence for good. Our orator from the Lone Star State, the Hon. R. H. Walker, says:

WHY EVERY BOARD SHOULD JOIN IN THE WORK.

There are several pertinent reasons why every State should give undivided support to the National Association of Boards of Pharmacy, for surely the efforts of this organization are all directed toward the ultimate aim of benefiting and strengthening each State board.

1. A congregation of ideas in the interest of good purposes commands strength and insures the success of the ideals cherished and the attainments begotten by hope.

2. The combined counsel of the many frequently furnishes a ready solution of knotty problems that may confront the various State boards.

3. Reciprocity agreements are the foundation stone upon which rests the entire fabric of justice and equity, of practical service and profit between nations. Such relations are equally as feasible between the State boards, combining to engender good fellowship, advance a community of interest to a high plane of adjustment, insure the laboring together with brotherly love toward the same good end, namely, better understanding of mutual good and the material growth of our profession to higher standards of proficiency.

4. The strong and powerful relations established by reciprocity are beyond the experimental stage. Therefore every State board of pharmacy should be persuaded to join hands with the many and contribute their part in making the National Association of Boards of Pharmacy more useful and powerful in its warfare for more enlightened and highly cultured pharmacy.

A letter written me by a secretary from a Southern board gives the following information: "We now hold an examination lasting two days on the following subjects: Chemistry, pharmacy, materia medica, posology, toxicology, practical work, prescriptions, oral work, and identification of specimens. It requires from 18 to 20 hours to complete this work, and we do not stop for the midday meal. After January, 1912, we shall add bacteriology and physiology to our list of subjects,

and shall require three days' time to complete the examination. We also hope to have after January, 1912, an additional educational requirement of one year's work in high school, and full graduation from high school after 1915. We feel we are advancing some, and we are bending all our energies to keep abreast with the popular demand for more proficiency in those who seek to practice pharmacy."

THE FUTURE.

The membership of each State board of pharmacy is yearly changed. Personally, in accordance with our State law, I complete my labors as a member of the Massachusetts Board this year. The more active members of the National Association must all of them in time sever their connection with this work.

but the foundation laid upon the solid rock of mutual confidence between the States will enable their successors to build such a structure as will guarantee that the standard of American pharmacy will be recognized as the highest and best of any nation in the world. This National Association of Boards of Pharmacy has so many advantages over the examining boards of European countries that I fully believe its influence for the betterment of pharmacy will extend beyond the seas. What its future aims will be it is hard to predict.

I feel sure that the National Association of Boards of Pharmacy will have the most enthusiastic gathering of delegates at the Boston meeting in August that it has ever had, and that more States will be represented than at any previous meeting.

SANE COMMENT ON CURRENT TOPICS.

Annual Address of the President of the Michigan State Pharmaceutical Association—An Intelligent and Interesting Survey of Conditions Affecting the Pharmacist at the Present Time.

By E. E. CALKINS.

GENTLEMEN—The year just past has been, I believe, a prosperous one for most of the druggists of this State. It has not been a time for making money easily, but has afforded the usual opportunity of making a living. While cut prices and itinerant venders have reduced the profits in some localities, there have been few failures, if any, and business has moved along smoothly for most of us.

THE MILES PLAN.

Some things have happened this year, however, that are worthy of notice. First among these is the failure of the Miles plan. We had all believed that the contract on these goods was impregnable. We now know that it cannot hold. Nor is there promise of any future plan by which retail prices can be controlled when the goods are sold through jobbers. We are all familiar with the direct contracts under which Eastman kodaks and certain brands of collars are sold, and it may be that if we are to get full prices in the future we shall have to sell only those proprietary medicines which are sold direct from maker to retailer. Certain it is that there will always be those who

will use advertised brands at cut prices to attract trade.

ITINERANT VENDER LEGISLATION.

Another item that has been brought to our notice very forcibly is the decision which swept away the itinerant vender law in Illinois. This law has been the model for legislative work in all the States where similar legislation was attempted. The failure to secure a similar law in Michigan two years ago by our committee, and the failure of the committee from the Michigan Retail Druggists' Association to secure the passage of a modification of it this year, merely repeat the story of similar failures in other States. The only real gain has been made in Indiana this year, where the pharmacists secured a law which prohibits the sale of drugs and medicines within two miles of a pharmacy. This really reserves to the registered pharmacist the business of all the most thickly populated territory, and may well be copied in our own State.

Up to this time, all pharmacy laws, so far as I have been able to learn, have been written for the protection of the public only. The

pharmacist has been made to comply with certain restrictions if he would conduct a pharmacy, but in return provision has not been made to restrict the sale of drugs and medicines to the registered, qualified pharmacist, except in the sale of certain poisons and the preparing of physicians' prescriptions. The laws of different States differ on this point, but in the main it is true that department stores and general stores may and do sell much of the merchandise that ought, in all justice to the pharmacist, to be sold only in drug stores. This new Indiana law is a step in the right direction.

THE THREATENED STAMP TAX.

Just now we are threatened with a new stamp tax on proprietary medicines for national revenue. The N. A. R. D. is moving to prevent its passage, but my experience with our State legislature has convinced me that the surest way to control the vote of our representatives in congress is to let them hear from home. If every Michigan druggist will write a personal letter to his representative and to both of the state senators, pointing out that the proprietors will not pay this 3 per cent tax but will instead increase it to 5 per cent and add it to the wholesale price; that while the retailer must pay this 5 per cent he cannot pass it on to the consumer because of the fixed retail price; and that it thus becomes an unjust tax upon the retail druggist; I am sure that we can secure the opposition of the Michigan delegation in Washington. Personal letters, many times multiplied, have more effect than the same number of names on a petition.

THE PARCELS POST.

I am aware that I shall be considered a heretic if I express my views upon another national issue—the parcels post. I believe in the parcels post. I believe that the express companies get most of their revenue from the retailer, and that the retailer would be also the greatest user of the parcels post and at a financial saving were it established. I do not believe that it would destroy the retail drug business, but that the retailer could use it, not only to reduce his transportation bills, but also to deliver his goods to his customers and to get more business. I believe that the sentiment against it as voiced by trade organizations has been largely originated and incited

by the express companies, and that the retailers are opposing a measure which would prove a benefit to themselves.

THE POISON-CORK BILL IN MICHIGAN.

One bill that passed the legislature last winter and takes effect November 1 is worthy of our attention, viz., the Hinckley Bill. This provides that the State Board of Health shall select a suitable cork top with serrated edges and mail specimens to every retail and wholesale druggist. After November 1 any person who fails to put one of these on a bottle of poison will be liable to a minimum fine of \$90 or imprisonment of not less than three months.

I am sure that every druggist is anxious to prevent accidents and is willing to use any reasonable precaution, but as it stands the law is a menace to every one of us. Let us suppose that a purchaser finds that the serrated edge cuts his finger, and so changes the cork for a plain one. How is a druggist to prove that he used the device prescribed by law, if after a month, or even a week, a case is brought against him and as evidence a bottle of carbolic acid with a plain stopper is produced?

Or, suppose later a child gets hold of the bottle of carbolic acid and is burned. Action for damages would at once be brought against the druggist, and the judge would instruct the jury that if they found the druggist was negligent in that he did not use the stopper provided by law, they must find for the plaintiff and assess damages. These cases may be brought up any time within two years after an accident—long after an accident—long after the dispenser has forgotten whether he put a plain cork in the bottle or not. What can a druggist do in such a case? I believe that a committee from this association should see the president of the State board of health at once, urging upon him the necessity of selecting a device that would *not* be thrown away by the customer, and I believe that the law should be repealed or amended at the next session of the legislature. I would also protest against pharmaceutical regulations to be enforced by the board of health.

DEPLORES TWO ASSOCIATIONS IN MICHIGAN.

I cannot refrain from expressing my regret that we have two associations for druggists in Michigan. The new association was formed just at the time when the condition of this as-

sociation was most promising, when it was increasing rapidly in membership, and had secured the active coöperation of the traveling men. The new association has caused a division of interest and effort, and while there was dissatisfaction with what was accomplished by our legislative committee two years after it had secured the passage of two bills complete as written, and had made an honest effort to accomplish more, I have not been able to learn that the legislative committee of the M. R. D. A. has accomplished any more.

I still believe that the same amount of work put into one association would accomplish more, and I trust that the officers of this association will make every effort to bring about a union of the two. I also suggest that the nominating committee bear this in mind when selecting officers for next year. For this reason I request and shall insist that the custom of electing the retiring president to the chairmanship of the Executive Committee be disregarded.

This association, with its twenty-eight years of active history, incorporated, recognized by law as the parent of pharmaceutical legislation to whom the Board of Pharmacy shall report, and with its Prescott Memorial Scholarship fund, should I think continue. If the management and personnel of the officers are not acceptable to the whole State, by all means let us change them so that all the druggists in the State may unite for their common good.

THE POSITION OF THE PHARMACIST.

The position of the druggist in the business and professional world is a peculiar one. Doing work which demands education and skill, and required by law to prepare himself for it, he is still not recognized by the public as a professional man. No druggist is ever publicly called in consultation by another, because of his greater professional ability. Neither does the public willingly pay him a professional fee. He is looked upon by the physicians and the public as a skilled tradesman who is in a position to overcharge the public for his services. And yet he must employ men who have had like training to assist him in his dispensing, and must pay them as much per year as a physician, lawyer or dentist would be paid were he hired by the year to work in the office of another. On the other hand we have a feeling that we are more than trades-

men, and in the majority of cases this feeling is so strong that we neglect to get the commercial training that is required for success in mercantile pursuits, and the most of us are SMALL tradesmen.

In some cases propaganda movements will succeed in bettering these conditions, especially in our relations with the physicians, but it is also true that the amount of pure pharmaceutical work in many places is very small and other stores are allowed to sell so much merchandise that ought to belong to the drug store alone, that druggists are compelled to compete with other stores on a purely commercial basis without the commercial training of their competitors, and yet are compelled to employ a high-priced clerk.

A SUGGESTION.

It has occurred to me that in some stores it might be profitable to select those things which can only be dispensed by a registered pharmacist and put them under lock and key, to be dispensed only by the proprietor or manager when he is there, and then to hire cheaper help to make sales, as do the department stores. Whether this is practical or not, I am not prepared to say, but I believe that druggists may improve their financial condition by copying the methods of the department stores in respect to window and store displays, attractive prices on certain leaders to attract trade, better advertising, and more wide-awake management generally. If a druggist must compete as a business man, let him use the methods that bring success in other lines which are exclusively mercantile.

In the meantime, let us also not neglect to cultivate the professional side of our calling, looking forward to the time which we all hope for, when pharmacy as a profession shall come into its own. Let us encourage our clerks to get the best education possible, and let us while training them along mercantile lines, hold up to them also the higher ideals.

In closing I wish to thank you all for the many courtesies which I have received from your hands during my six years' official connection with this association. The many delightful personal acquaintances which have been made, and the pleasant memories of my association with you during these years, have repaid and will repay many fold for all the time and effort I have given to the work.

CONDUCTING A CIRCULATING LIBRARY.

**A Profitable Side-line—Why the Druggist Should Own His Books—"Best Sellers"
Always in Demand—Benefits that Accrue to the Owner of the Library.**

By C. A. WEAVER.*

After running a circulating library for three years as a branch, my experience, coupled with some information borrowed from others, who still continue to plug some one else's game, for the mere pittance of from 5 to 20 per cent, led me to believe that operating one's own library was well worth the trial. And I have since proved that a library thus operated is a most profitable side-line, as I will endeavor to show.

THE QUESTION OF VARIETY.

The average branch circulating library consists of from eighty to one hundred and fifty books. And in a city the size of Detroit there may be as many as from fifty to one hundred branches. It has been contended that in order to make the scheme a success, the books at the different branches must be as varied as possible, to allow of changes as often as certain books become dead in the different locations.

Our experience with a system of this kind proved that the everlasting changing of books was a bad thing for the library, inasmuch as the readers or their friends continually asked for the books that had been taken away. This was also true of newer books, a few of which only would appear in the library until many months had elapsed since their publication.

This absence of the newer books was the worst feature of the old library. Constant excuses on our part for the owner's management or mismanagement were necessary.

The average library of this kind is made up of from 50 to 75 per cent of the older books, the copyrights of which have run out, and which may be purchased at wholesale prices varying from 19 to 38 cents. The balance of 50 to 25 per cent may be made up of the more recent and popular editions, which, as a rule, are quickly taken up by the more up-to-date readers, leaving at all times a vastly

larger number of the old "has-beens" than is good for a supposedly healthy circulating library.

In contradistinction to the foregoing, in owning your own library, you buy only those books that are in demand. Consequently you have them when they are new, and, of course, have enough copies to supply the demand whatever it may be.

THE CIRCULATING LIBRARY A SUCCESS.

It is surprising to see the repeating qualities of some books, while others are a complete disappointment. But I believe, after the reading of this paper, you will agree with me that, taken as a whole, a circulating library is a most successful side-line.

A circulating library is apt to be—in fact, should be—a success, because the average reader cannot afford or does not like to pay from \$1.25 to \$1.50 for a work of fiction that once read becomes of but little or no value as a permanent addition to his library.

The circulating library supplies this same demand for popular fiction at the extremely low price of 2 cents a day, with a minimum charge of four cents, making it possible for the reader to keep up to date on all good reading. It also places at his command from 15 to 37 books for what the price of a single copy would be.

Our experience shows that the average reader pays from 4 to 10 cents for each book taken out. Compare this with the average price of the cheaper magazines. They read from 2 to nearly 4 books by the very best of fiction writers for the cost of one, often mediocre, magazine. Some readers, through negligence or an inability to read quickly, return the book late, and, therefore, pay even as much as the full price of the work. While to allow a customer to pay full price of a book is in our estimation a poor plan, at the same time it is one that it is almost impossible to get away from. Still it is evident in this case, as in all others, that the minute you break a

*A paper read before the Michigan State Pharmaceutical Association.

rule it no longer holds good with any one, no matter how small a license he have in thinking he should be so favored.

In order to avoid these troublesome cases we have decided to adopt at once a system whereby the customer is given a card on which are recorded all the details pertaining to the taking out of a book and its return. This card remains with us and is filed away. Thus we can put a time limit of ten days on each book. At the end of that period if the book is not returned, the customer can be notified. I believe the one disadvantage in operating one's own library, namely, the loss of the books, will be minimized or entirely done away with.

THE ADVERTISING BENEFITS.

The advertising advantages that go with a privately owned library are of the greatest importance and should by all means be credited to it. Instead of advertising the goods of little or no profit, as is done in some corporation-owned libraries, you advertise your own preparations. Insert write-ups about your own store, your methods of doing business, little toilet hints to the ladies, cigar write-ups for the men, and many other things too numerous to mention.

Some druggists say they do not know how to conduct such an advertising scheme. My advice to them is to take up some good system of drug-store advertising and select from it the parts that appeal to them or their trade. From these let their printer make copies for inserts. Take a dozen or two of these ads. and have them printed together on one large sheet. Next order from an engraver a cut of this group of the size of the insert that is to be used. This is merely a suggestion for purposes of economy. The dozen ads. printed on one large sheet cost much less than the individual inserts printed separately. At any rate the expense of buying the system and printing the inserts too would be but a small item.

In other libraries, manufacturers pay a good price for the privileges of inserts, a great deal more than the cost of printing. In one case the insert brings you little or no profit. But again where the druggist owns his own books and controls the advertising, the profit is large. Here is one real advertising medium. Think of the ads. that may be

written of your own private specialties not carried by the average store, and which always interest your customers.

METHODS OF SELECTING BOOKS.

In the selection of books, several methods present themselves. For instance, there are the criticisms of the different reviewers or the following of the most popular authors and illustrators. Many readers, too, size up a story by the pictures. Still another method we use is that of visiting the more prominent wholesalers of books and buying only those which they purchase in the largest quantities. A review may express but one man's opinion, and his ideas may be entirely different from those of the reading, fanciful public. You may depend on it, the book store will seldom be fooled. It is their business to buy books that sell, and it is dollars to cents that their judgment on what books will be read or in demand will be more nearly correct than the reviewer's.

There is a great deal of pleasure as well as profit in keeping a library up to date. Then, too, it is a good ad. for one's store to be able to say at all times, "Yes, we have this book in our library," even if at the time it is out. A good scheme in connection with this is to take the customer's name and to call his attention at the first opportunity to the fact of its return to the library.

The number of copies of any one book that might be placed in your library must be left entirely to your own judgment. But at the outset I would advise single copies only. Such books as "The Rosary," "The Shepherd of the Hills," "The Trail of the Lonesome Pine," "The Second Generation," and many others, when new, were in very great demand, and two or more copies might be used in such cases.

In starting a library, your own judgment and capital must say how many books to install, but I would advise at least fifty. The rental money from these should then be reinvested, until the library is built to a point where you are satisfied with its proportions and earning capacity.

We expect to build our library up to 1000 volumes. At present, after a year and a half, we have 275 volumes. One can scarcely add more than 25 to 50 books a year, since there are seldom that number of good books of fiction published.

THE ADVANTAGES SUMMED UP.

To sum up the advantages of owning one's own library, I would mention:

1. Larger profits.
2. Advertising advantages.
3. A more complete line of latest books.
4. Once in the library, books are always a part of it.

As a last remark, our library has shown most satisfactory results. It not only paid for itself the first year, but also showed a profit of over 100 per cent. The first five

months of this year the profit on the new investment has been nearly 300 per cent. Compare this with the old system, where you make from 5 to 30 per cent only, besides not owning one book. The other fellow has possession.

Our losses were unusual, as they totaled nearly 10 per cent of our library. Most of these books were drawn by people leaving the city, and some few were taken out under fictitious names. Under the card system, with satisfactory references from each customer, I believe we can stop such leaks materially.

AN IMMENSE TALCUM WINDOW.

Nearly seven gross of talcum powder packages in the window at once represents a display of unusual proportions. But such a trim was actually seen in the store of W. J. Sturgeon, of Kittanning, Pa. There were 700 packages exhibited together, representing 35

sizes ranged from pound jars to 4-ounce tins, in a wide and varied assortment.

Arranging the trim must have involved quite a little work, for we can count sixteen rows of powder. That means that as many shelves had to be set up before one could pro-

different brands. The goods rested on glass shelves and at night were illuminated by a flash of three 60-watt lights, making a very pretty show.

We won't attempt to name the different powders on display, but it is safe to say that none of the popular ones were omitted. Among the various odors were violet, carnation, cashmere bouquet, and heliotrope. The

ceed with the rest of the trim. Each shelf supported over 30 packages.

The very size of the display, not to mention the artistic designs characteristic of talcum powder containers, doubtless made a vivid impression on people passing by. Especially at night, when the lights were on, the varicolored packages must have been very attractive.

DRUG-STORE SKETCHES

ALGERNON TAKES A HAND IN THE TELEPHONE GAME.

By CLEO C. LONG.

"There!" announced Algernon, driving the last tack in a neat new sign above the telephone, "that *may* hold 'em for a while, but I doubt it. It takes more than kind words to infloonce these dames with the telephone habit."

"What does it say?" asked the pretty cashier, absently running her finger over the grill work of her cage in search of her most recent wad of chewing gum.

"It reads thus," declared Algernon with dignity:

"OUR PATRONS ARE AT LIBERTY TO USE THIS 'PHONE, BUT ARE REQUESTED NOT TO ABUSE THE PRIVILEGE. PLEASE LIMIT YOUR CONVERSATION TO THREE MINUTES. GIVE OTHERS A CHANCE."

"Some sign, eh?" he commented. "Conveys a gentle and subtile hint to the average intelligence, does it not? This, little people, is an example of the art of using language for the purpose of speech, as it were."

"Did you cook it up?" asked the soda-fountain boy, not without admiration.

"Not entirely," admitted Algernon modestly. "The boss wrote the words and I wrote the music, but your Uncle Algy is the boy that put it in printin'. Is it not a pretty thing?"

"Well, I bet it don't do no good," concluded the soda boy pessimistically. "First place, take that bunch o' girls whater always droppin' in after the matinée to use the 'phone. It won't touch 'em. If you want to hand *them* one, you gotta put it to 'em straight. Put up a sign that says 'Beat it, kiddo' or 'On your way,' and they'll know what you're talkin' about."

"Right you are, Clarence, my boy," admitted Algernon. "But listen: the next one of that bunch that comes in here to hand hot air to her beau is goin' to get something handed to her special, from me! Say no

more," he added mysteriously, "Vendetta! But keep your eyes on little Algy."

That afternoon about five o'clock, while the matinée rush was on at the soda fountain, and the cashier was very busy accepting payment for the refreshment so swiftly dispensed by Clarence and his assistant, Algernon, temporarily at leisure, assumed an easy attitude in the passage that led to the telephone and looked guileless. As the rush began to subside he was approached by a sweetly pretty little thing in a very tight skirt, very short coat, nobby little hat, and tan pumps. She looked as if her name might be Gertie, and she had just partaken of a strawberry cobbler.

"I'd like to use the 'phone, please," quoth Gertie with some hauteur.

"I beg your pardod?" said Algernon, instantly alert and giving evidence of the closest attention, "I didn't catch whad you said. I'b chuck full of quidide, od account of a cold."

"I said I'd like to use the 'phone a minute," repeated the sweet girl creature as one who demands an obvious right. "Will you let me pass?"

"Sassafras?" remarked Algernon, assuming a look of enlightenment. "Certainly. Id whad forb?"

"I didn't ask for sassafras," asserted the girl, growing both embarrassed and indignant, and enunciating very distinctly. "I only want to use the 'phone a moment on important business."

"If id's for dizzidess I'd advise you to ged a prescribtion frob a doctor," suggested Algernon. "Calobel, perhaps, not sassafras."

"Gee, but you're deaf," shrieked the blushing girl. "I don't need any medicine at all. I want to use the telephone," indicating the instrument with an unmistakable gesture.

"Ah, sure, sure, call up the doctor dow, and I'll be with you agaid in just a moment," said Algernon, and then he vanished behind the prescription case.

Gertie, much relieved, approached the 'phone and called for a number, keeping one watchful eye on the entrance to the prescription department, in evident dread lest Algernon should reappear and force her to accept either calomel or sassafras. But Algernon had evidently found other business, and presently the girl got some one on the wire whom she joyously hailed as "Toodles."

The soda fountain rush had abated, and

Clarence edged along toward the end of his domain and kept one ear open for the telephone talk. What he overheard called forth the following interpolated comments:

"Is that you, Toodles? Guess who this is." (Aw, gee, that guessin' game gives me the botts.) "I'll bet you *do* know. Say, do *many* girls call you up at the office?" (Gawd forbid, fer the feller's sake!) "Well, listen, Toodles; didn't I say I'd call you up if I was down-town to-day? Uh-hu. Well, listen, I *am* down-town now, uh-huh, at Pillpenny's, uh-huh. Don't you think I'm too little to be down-town alone?" (Ain't she the young romp?) "Sure I'm alone, uh-huh; been to the matinée with Mabel and Sadie, uh-huh. Oh, pretty rotten, uh-huh. Yes, they've gone home, uh-huh. I had an awful time loosin' them, uh-huh. I told 'em I had a date with the dentist, uh-huh. Wasn't that just too cute?" (Heaven keep the loffter from me lips! muttered Clarence.) "Well, listen, Toodles; I think I am too little to go home *alone*, don't you? Honest, don't you think so? What time can you——? What? Sir? Oh!"

Gertie's face suddenly took on a look of surprised horror. "Oh!" she gasped again, and hastily hung up the receiver and hurried from the store.

A moment later Algernon came weakly out from behind the prescription desk. He was evidently laboring under extreme emotion, and he clutched the nearest show-case for support.

"Gee, what happened to the Gertie girl?" demanded Clarence. "She was spielin' along like a hot-air furnace full of molasses, when all at once she biffs it on the hook and you ought a' seen her beat it. How'd you work it, Algy?"

"Easiest thing, you know," said Algernon between gasps of joy. "I held her up for a while pretendin' I was deaf, and then I let her get at the 'phone, you know, with *me* on the extension behind the desk. She called her number and asked if it was Wakefield & Smith, and then asked for the shippin' department, and Toodles' real name is Mr. Button. What you know about that? Say, he has my sympathy, too. He was fussed to death bein' held up with that line of talk, at the works, you know, but tryin' to hand the

girl a line of salve, too. When I thought it had gone far enough I put in a deep voice, and sez I:

"Here, here, this is Mr. Smith. This wire is for business, and our young men have got to attend to business in business hours.' Then you ought to heard two phones slam up in a hurry. Oh, gee, it was a scream!"

"Algernon," said Clarence, with a great show of emotion, "if ever I held an unjust thought of you I repent. Come and let me imprint a chaste kiss on your brow. I take off my hat to you. You are pure class! You are the smoothest little piece of machinery I ever saw."

"I certainly am all to the mustard," acknowledged Algernon, with becoming modesty. "I expect to get my salary raised for this. Give us a mint cocktail, old man."

BOARD QUESTIONS ANSWERED

AN ILLINOIS EXAMINATION.

PRESCRIPTIONS.

(Continued from June BULLETIN.)

No. 1702.

FOR MISS FULLER.

R Tinct. ferri chlor.....f5ii.

Acidi tannici,
Ext. belladonnæää 64.
Adeps lanæ hydros.....1280.

M. ft. ungu.

S.: Apply as directed.

Dec. 1, 1908.

DR. BLANK.

The extract of belladonna should be made into a paste with dilute alcohol and the paste mixed with some of the wool-fat. The tannic acid should be dissolved in a small amount of water and likewise mixed with another portion of the wool-fat. The lead acetate should be dissolved in a few drops of water, or reduced to the finest powder, and it and the opium each separately mixed with portions of the wool-fat. The four separate ointments should then be combined to form one smooth homogeneous ointment containing all the ingredients. The finished product should be a perfectly smooth greenish-brown ointment free from lumps or grit.

LETTERS

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

THE POSSIBILITIES OF THE SPICE BUSINESS.

To the Editors:

It is to be regretted the druggists throughout the country have neglected the greatest trade-getter easily within their reach—the spice trade.

In July and August I sent out over 500 circular letters to people selected from my mailing list. In each I enclosed 1 drachm of Saigon cinnamon. The sample was put up in a waxed powder paper sealed in a coin

O. W. WINKELPLECK,

DRUGGIST.

SUGARCREEK, OHIO.

WHERE TO BUY SPICES, AND WHY.

It will take you about three minutes to read this and, take my word for it, it will be the most profitable three minutes you ever spent.

SPICES are articles that should have special attention when buying. You should be quite sure they are not only pure but up to the standard STRENGTH as required by the Government Standard.

You may not know DRUGGISTS carry such articles as mentioned below. You may be one that thinks all SPICES are alike, and have been buying all such articles in fancy tin or paper packages put up by some Tea Company or Spice Grinder. There may be someone in them for you to get a premium sometime. Well!

Do not forget you are paying for all fancy packages and premiums. If you will buy your SPICES in BULK, and premiums separate, you will save 25 cent on every dollar. And further, how do you know anything about the STRENGTH? In fact you are not in a position to know, neither does the party who sells them. No doubt but the packages bear the word "Pure." No doubt they are. But don't be deceived by this word "Pure." They may be pure but very deficient in strength.

Why are the BEST SPICES sold in Drug Stores? How is it in plain truth.

All drugs (spices are classed as drugs) must be of a certain standard of strength as well as pure. Such SPICES as Cinnamon, Cloves, Allspice, Mace, are used in compounding medicines, either for their cumulative power or used to disguise medicines which are unpleasant to take.

All drugs or SPICES must have a certain strength, and this standard of strength is fixed by the Government, which is published in a book called the United States Pharmacopoeia. This book is the basis of Pharmacy and a guide to all drug establishments, either Drug Stores, Manufacturers, Wholesale or Retail. This standard of strength is COMPLIED with by the drug trade and therefore you can readily see why the BEST SPICES are sold by druggists. The same will apply to Flavoring Extracts, such as Vanilla, Orange, Lemon, etc.

Another reason why the BEST SPICES are sold in drug stores. The best and choicest spices are imported by the drug importers for the retail trade. This is the source of supply for the retail druggists. Before they are sent out by importers or drug grinders they are all analyzed or tested for STRENGTH and PURITY as required, and each and every bulk package must bear the U. S. P. label, showing they are up to all requirements.

Such spices that are below the standard in strength and not fit for drug purposes are put up in fancy packages and sold for culinary purposes and table use, the package knowing druggists will not buy them for compounding medicines.

The spice trade to the druggist is like the farmer as to what he raises. HE GETS FIRST CHOICE. Every pound of spice I buy comes from the BEST HOUSE in the United States. They are all analyzed and are positively what I represent them to be. They are BETTER, CHEAPER, ALWAYS SATISFACTORY and can be DEPENDED UPON.

I am enclosing you a sample of Cinnamon for you to try and to note the difference between this HIGH GRADE CINNAMON and the ordinary article which is generally sold in packages.

The others mentioned below are of the HIGH GRADE QUALITY.

Allspice	Pepper (Red)
Clove	Pepper (Black)
Ginger	Thyme
Mace	Turmeric
Mustard	Mixed Spices, Whole (for pickling)
Nutmeg	Coriander
Sage	Anise

One of Mr. Winkelpleck's circulars.

envelope. On the envelope I had printed: "A Sample of Cinnamon, Pure and Strong. Try it, nothing like it." Then followed my name and address.

I was surprised at the results. I had many tell me they were glad to know where they could get good spices. Most of them came in and asked for cinnamon. Then it was up to me to call their attention to the other products

of the kind which I had. Nine times out of ten I sold them cloves, mustard, nutmeg, etc.

I had bought the best I could get. Quality came first, price afterwards. But I charged accordingly. I made a better profit than I could on cheap stuff and satisfied my customers.

If every druggist throughout the country would do as I have done, it would be but a few years before the spice business would be back in the drug store where it belongs. This line of trade should be an eye-opener to the druggist who has cut prices to compete with. Instead of watching what the other fellow is

it, and regret it, and wish it could be better. Yet lo and behold! Here is a gentleman from Connecticut who, like the convict we now and then hear about, refuses his freedom when he might have it.

Why, Mr. Bennett even *acknowledges*—*admits*, mind you, brethren!—that the national pure food law and the anti-narcotic laws of the various States are of some use, and these are the laws that the most prominent men in our profession, our State and national associations, have been fighting for during the last ten years.

Mr. Bennett asks us to imagine what would happen if the sixty-hour-a-week law became effective throughout the United States. All that I can say is this: I don't know of any one thing that would be of greater benefit to the profession at large than that this law become effective throughout the United States.

Let us suppose that the average druggist in the United States works, as Mr. Bennett says, only 100 hours a week. Only 100 hours out of a possible 168! Fifteen hours a day for seven days a week. Surely a light day's work for any man! Only double the hours that our masons and boilermakers work. Only double the hours and at half the pay! But, gentlemen, think of the terrific mental strain that the average painter or plumber works under. Did you ever notice it? Of course it requires no presence of mind to wait on a few soda customers and paint customers and stamp customers and to try to put up a few prescriptions in the meantime.

But then, as Mr. Bennett says, the average clerk has many a minute in which he may relax, say in the evening, for instance, when the wall-paper and soda trade is dull. He may even stand at the front of the store and watch his friends go by on their way to a good time, much like a G. A. R. vet. who is unable to march on Decoration Day and can only watch the parade.

I claim that the 60-hour bill would be a benefit, not a burden, to every druggist in the land. It is not the public that forces the druggist to keep open fifteen hours a day or longer. It is the druggist's own mistaken idea of what the public wants. The public has supported, willingly, any effort to shorten the hours of labor of the druggist. We tried a closing plan in our own city, closing at 8 P.M. We found it worked well, caused no

O. W. WINKELPLECK,

DRUGGIST,
SUGARCREEK, OHIO.

True Extract of Vanilla.

I am enclosing you a sample (one teaspoonful) Extract of Vanilla for a trial, and to demonstrate to you the HIGH GRADE VANILLA I carry regular in stock. Compare it to the ordinary Extract of Vanilla or Vanillin, whichever you may have, and notice the rich, pleasing flavor it has. Use a little less of this than the kind you have been using. It is made from true Mexican Vanilla Beans, without artificial flavor or coloring.

Imitation Vanilla.

In past years people have been deceived more with Extract of Vanilla than any other flavoring extract.

Before the Pure Food and Drug Law was passed the imitation Vanilla (now called Vanillin) was all called Essence or Extract of Vanilla. But since the passage of this law it is put out under a dozen or more different names, such as, Vanillin Flavoring, Compound Tincture Vanillin, Compound Essence of Vanillin, Vanillin Flavoring (synthetic), Vanillin Flavor (imitation), Extract of Vanillin (no alcohol), and many others.

The stuff as put up under such names is made from Vanillin and Coumarin; these are made from Cou-Tee. They are dissolved in water, to which has been added Potash (lye), then colored with burnt sugar (caramel). The cost to make a gallon of this is about 60 cents.

This is where you get the big bottle for 10 or 25 cents, usually put up in a fancy package. This imitation Vanilla will get rancid by age and unfit for use, while the True Extract Vanilla will improve by age.

After you have used this sample of True Extract of Vanilla, which I am enclosing herewith, you will readily see the difference.

THIS IS THE KIND THAT I USE. THE KIND YOU OUGHT TO USE.

QUALITY! PURITY! STRENGTH! ECONOMY!

Another circular.

doing in the way of reducing prices, let him cut loose along these lines. In a short time he will have people coming to his store who have never dealt with him.

Not only will it do this, but it will elevate the standard of his store and thus gain the confidence of his trade for other lines of business.

O. W. WINKELPLECK.

Sugarcreek, Ohio.

HE BELIEVES IN THE TEN-HOUR DAY.

To the Editors:

On page 212 of the BULLETIN for May appears a letter by Burton L. Bennett on the subject of "The Ten-hour Day," upon which I wish to make the following comments:

Most of us realize how long our working hours are in the drug business. We realize that on one pretext or another we work about double the time that we ought to. We realize

loss of business, and we heard not one complaint from a customer. The 60-hour-a-week law would force the stores to close or have two shifts of clerks. In nearly all instances two shifts of clerks would be unprofitable. Therefore it would make absolutely necessary some harmonious arrangement in regard to closing.

The idea that a druggist must stay open to dispense medicine is wrong. Aren't people just as apt to be taken sick at 3 A.M. as at any other time? They can't get into a drug store then. If a person is sick enough to need medicine at that hour of the night or any other hour that the drug store is closed, he is sick enough to call a physician.

Mr. Bennett says that the hours of a clerk should be a matter of adjustment between the clerks and the proprietor. I know of a case in which the proprietor of a chain of several drug stores threatened to discharge any clerk of his who joined a drug club that was fighting for twelve hours a day! Here, again, this law would have forced harmony or would have forced the man to put on two shifts, which I am sure would have been unprofitable. Mind you, I don't say all employers are that way—I for one am not—but I know there are enough of them to force the rest of us to keep open.

I sincerely hope that every druggist—employer and employee—will fight for, not against, this bill wherever and whenever it appears.

F. C. BEHLING.

Janesville, Wis.

WE ARE DISCIPLINED.

To the Editors:

You ask, regarding the change in the BULLETIN cover: How do you like me in my new summer dress?

I don't! Heine says: "Melancholy, thy name is calico!" and that is the way I feel about your calico outfit. Don't blush—I am in love with you, worship the ground, etc. No, that's going too swift—but I cling to the *old and tried*—and follow Goethe's "And custom he calls his nurse." The Interno of the BULLETIN is so excellent—why bother about the Externo? Would you not feel shocked to see Abe Lincoln in a pair of Kit Alexander gloves, desecrating the hand that wrote the Emancipation Proclamation, by the flimsy, flippy rule of Dame Fashion?

No, Harry, the old was so dear to me that I shall miss the accustomed dear old cover.

Chicago, Ill.

WILHELM BODEMANN.

To the Editors:

It is always a question as to whether we like our old friends best in their old clothes, or when they come out with a brand-new suit. When opening my mail this morning I had to look twice in order to recognize my old friend clothed in a new dress. At first I confess to my disappointment in its appearance, but as the day proceeds I begin to like it better, and possibly by the time the next issue comes in, I will have become reconciled to the marked change in its appearance. However, the *inside* of a book is what counts, and I never peruse the pages of the BULLETIN without finding something live, interesting, and instructive.

St. Louis, Mo.

L. G. BLAKESLEE.

To the Editors:

Compliments on your new summer suit for the BULLETIN! I am favorably impressed—although when the cover popped out at me first from the wrapper I thought I was color blind for the moment. The new suit is a hummer—but the "inside" beats it a mile!

Gridley, Ill.

J. EARL TAYLOR.

To the Editors:

Allow us to congratulate you on your new dress. We think it is a decided artistic improvement!

THE BURGESS DRUG CO.

Boulder, Colo.

CYANIDES OR PTOMAINES?

To the Editors:

In your April, 1911, issue there is an editorial with the caption "Cyanides or Ptomaines—Which?"

Your remarks about potassium cyanide causing a great many cases of so-called "ptomaine poisoning" may be in part correct. However I beg to state that I have been collecting ptomaine poisoning statistics for a number of years and have not heard of one case being caused by coffee on account of the coffee-pot having been cleaned with powder containing potassium cyanide; nor do many of the cases occur in hotels. Such cases frequently occur at church festivals when the ice-cream has been made in a freezer which has not been thoroughly cleansed, thus enabling poisonous bacteria to propagate unmo-

lest in the crevices of the can, and on the paddle which stirs the cream.

The majority of such cases occur, however, from eating canned meats which have been left in the can, exposed to the action of the atmosphere. They come, too, from sausage, fish, etc., not properly preserved.

Prior to the enactment of the food and drugs act, ptomaine poisoning cases were not as frequent as they have been since the enactment of this law. According to statistics, there were 34 cases of ptomaine poisoning, nine of which were fatal, in the United States during the months of July, August, September, and October, 1906. During the year 1906 boron preservatives were used on flesh, fish, fowl, and oysters. During the same period in 1907 there were 1906 cases of ptomaine poisoning, 58 of which were fatal. The law enforced in 1907 prohibited the use of boron preservatives. The foregoing data show an increase of over 5600 per cent in the number of cases of ptomaine poisoning and over 500 per cent in the number of deaths. There is no question whatever but what this enormous increase was caused by partaking of foods not properly preserved.

Since the enforcement of the food and drugs act there have been 22,741 cases of ptomaine poisoning, 1012 of which were fatal. The reports from which these statistics are obtained are as accurate as possible. It is true that some of the cases reported in the press may often be due to acute indigestion, caused by the impure food ingested. There have been in this period, however, thousands and thousands of cases which were not reported in the press, and which will more than offset any inaccuracies in the foregoing statistics. To prevent such cases it is absolutely essential to use a preservative with sufficient antiseptic properties to prevent the propagation of poisonous bacteria, and the public should be warned through the press of the necessity of removing canned goods from the can and consuming them as soon as possible thereafter.

New York.

H. L. HARRIS, Publicist.

OLD JOURNALS WANTED.

To the Editors:

On April 18 of this year I addressed a communication to various pharmaceutical publications informing them that the disastrous fire

in the Capitol building on March 29 had destroyed our educational records and left me without access to the volumes of these journals. A very generous response to that letter has afforded a quite complete file of different periodicals. I take advantage of these gifts to enter on the task of completing the files and paving the way for a State pharmaceutical library of a complete and educational character. I would take advantage of your columns to ask from time to time for such numbers of different journals as we need. For the present let me ask if any of your readers can supply us with the following copies of *Merck's Report*: Volume 14, No. 1; Volume 15, No. 6; Volume 18, Nos. 6 and 7.

H. L. TAYLOR,

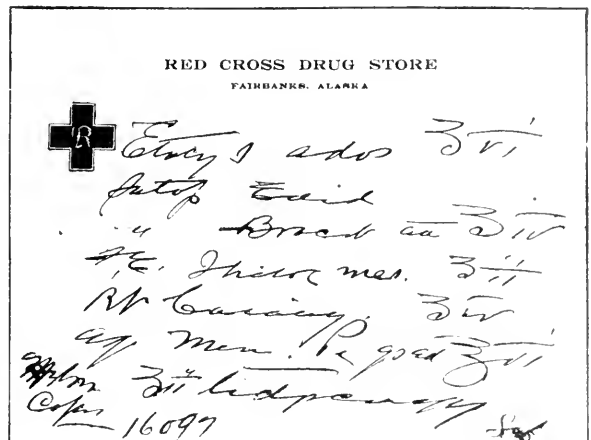

Secretary Pharmaceutical Syllabus Committee.

State Normal College, Albany, N. Y.

THE PRESCRIPTION INTERPRETED.

To the Editors:

On page 215 of the May BULLETIN I observe the reproduction of a prescription sent

in for interpretation by E. A. Mitchell. My interpretation is as follows:

Sodium salicylate.....	6 drachms.
Potassium iodide.....	4 drachms.
Potassium bicarbonate.....	4 drachms.
Fluidextract of colchicum.....	2 drachms.
Tincture of guaiac.....	4 drachms.
Peppermint water, enough to	
make	6 ounces.

Mix and take two teaspoonfuls three times a day after meals.

DR. BURROUGHS,

Des Moines, Iowa. of the Standard Chemical Co.

To the Editors:

The prescription from E. A. Mitchell, Van-

couver, B. C., in the May BULLETIN when interpreted would read as follows:

Sodium salicylate6 drachms.
 Potassium iodide4 drachms.
 Potassium bicarbonate4 drachms.
 Fluidextract colchicum seed....2 drachms.
 Tincture guaiac4 drachms.
 Peppermint water, to make.....6 ounces.

Two teaspoonfuls three times daily in water after eating.

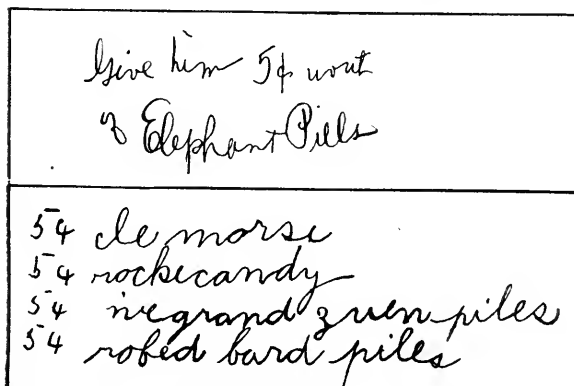

I was called upon by an attorney one time to interpret a letter. It had been written by a married man to another man's wife and had been intercepted by the authorities. This was written the same way as the prescription; so when I get hold of anything puzzling like that I always look for reversed words.

J. G. ANDERSON,
 Wadena, Minn. of Anderson & Stedman.

TWO OR THREE GOOD SPECIMENS.

To the Editors:

I am sending you some customers' orders which deserve a place in your column of curios. No. 1 represented a newly coined

name for Alophen Pills. No. 2 called for Irish moss, rock candy, quinine pills, and rhubarb pills.

MEYER TUMAN, PH.G.
 Brooklyn, N. Y.

HE DOESN'T AGREE WITH MR. RAUBENHEIMER.

To the Editors:

Last December you very kindly reproduced a prescription which I submitted to you to be deciphered. I have just noticed that among other interpretations, one appeared from Mr. Raubenheimer in the February BULLETIN. I would not care to be in the poor pill-roller's

shoes who dispensed formalin on this prescription! I have filled this particular prescription a number of times and am quite fa-

miliar with it. It calls for Iosaline 2 ounces, and the directions are as follows: "Apply to knee after bath 1/2 hour and at bedtime."

R. T. O.

"DECOLORIZING" TINCTURE OF IODINE.

To the Editors:

I notice on page 219 of the May BULLETIN a query entitled "Decolorizing Tincture of Iodine."

Our method is a quick one. We shake the U. S. P. tincture with sodium hyposulphite, using about two ounces to the pint, although I have never made an exact weighing of the hyposulphite. Five to ten minutes' shaking will yield a colorless product—not a real tincture, however, for I admit the resulting preparation is most likely a solution of sodium iodide.

EMIL REYER.

South Bend, Ind.

To the Editors:

I would thank you to renew my subscription to your most estimable publication. Each number is full of interesting, meaty articles, and I am sure the subscribers of your journal find the time spent in reading it both interesting and profitable. Your Dollar Ideas are always good—and so is everything else in the BULLETIN!

W. A. MADDEN.

Santa Clara, Cal.

* * *

To the Editors:

Since my earliest apprenticeship days I have always been an ardent student of the BULLETIN. I have gained more real practical knowledge from the BULLETIN than from all the other journals combined.

New Orleans, La.

H. CUSTER NAYLOR.

THE SODA FOUNTAIN.

SOME SUGGESTIONS.

By OLLIE MILLER,

Soda Dispenser at the Gray & Worcester Fountain, Detroit, Mich.

I am in favor of offering the employees some kind of inducements to encourage better effort. For example:

Arrange the check system so that each man can show what he is doing. Then offer a prize to the one turning in the most checks each week. You will find the help will all be on the job.

Arrange a breakage system. Impose a 5-cent fine for each article broken. At the end of the week let the one who has broken the least get it all. Each man has a chance, and every one will be careful.

Give each man an afternoon off each week to see the game. The force will work all the harder for the firm.

Give the head men on the shifts some privileges over the others. That will make the others work harder and try to reach the top of the ladder.

TEN-CENT SODAS.

I have been asked my opinion of the ten-cent soda which has been the talk of Detroit for the past two years. The proprietors have consulted one another about this, and if you meet one on the street and ask him what is the news he will say: "Well, we are all willing to charge ten cents for sodas except Mr. —."

In other cities, large and small dealers have successfully charged 10 cents for sodas. Why not all of us? No doubt the one contestant is doing all the business he can. Else he could not oppose the movement. And if the others would go ahead, it would not be long before Mr. Holdout would come in. The others would be serving finer soda. The public would see the difference, and in a short time the public would demand 10-cent sodas.

The cry is the business would drop off. Even if it were to drop off half, the receipts would be just as much as the sale of 5-cent sodas, and the profit is much greater on a 10-cent soda than on two 5-cent sodas. The help, too, could be cut down, and the soda-fountain expenses in general could be lessened until the public would get accustomed to these prices.

FANCY NUT SUNDAES.

Besides the nut sundaes which are prepared from dressings, of which nuts are one of the component parts, there are many fancy dishes prepared from ice cream, by the use of nuts in combination with other dressings, or by the use of dressings containing nut meats, combining them in various ways with other dressings, etc. This method of serving ice cream is one of the most popular to-day, and in view of the fact that it has been discovered within recent years that nuts are of exceptional food value, these combinations undoubtedly furnish one of the most substantial

dishes served in ice-cream parlors and at soda fountains. Here are several formulas of the kind suggested by the *International Confectioner*:

AUSTRALIAN SUNDAE.

Put a No. 10 cone of two kinds of ice cream into a sundae cup and pour over it a little raspberry syrup; sprinkle with chopped mixed nut meats, and top with a maraschino cherry.

BACHELOR SUNDAE.

Put a No. 12 cone of vanilla ice cream and one of chocolate ice cream into an oblong dish. Over the vanilla cream pour a ladle of the following dressing: Take one pound of hickory nut meats and grind them fine. Add one pint of sweet cream and one-half pound of sugar, and bring the mixture to a boil. Then add two heaping spoonfuls of marshmallow whip. Keep in a cool place. Over the chocolate cream pour a ladle of the following: Prepare the same as before, only use one pound of raisins instead of the nut meats. Top with whipped cream and stuffed raisins.

STUFFED RAISINS.

These are prepared by removing the seeds and filling the raisins with finely ground hickory or other nut meats.

BILLIKEN SUNDAE.

Put a No. 8 cone of vanilla ice cream into a sundae cup. Crown with a maraschino cherry. In the top of the cone stick some broken walnut halves so as to make a circle around the cherry. Over this pour some chocolate syrup.

BOSTON NUT SUNDAE.

Cut a slice of peeled orange into sections. Cut a slice of Hawaiian pineapple into small triangles. Put a No. 8 cone of vanilla ice cream into sundae cup, and arrange the fruit, cuts, and whole of English walnut meats artistically around the cone, and top with a maraschino cherry.

CHERRY GRAPE SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup. Sprinkle with chopped walnut meats, then pour over the cone equal portions of grape and sherbet syrup. Top with whipped cream, and crown with a maraschino cherry.

CHERRY PECAN SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup and arrange a row of candied cherries around the base. Above this, place a row of pecan halves. Top with whipped cream, and sprinkle with chopped pecan meat. This may be varied by running rows of cherries and pecans up and down the sides of the cone.

PLAIN NUT SUNDAE.

Put a No. 10 cone, or mound, of ice cream in a sundae cup, and sprinkle with chopped nut meats of any desired kind.

ENGLISH WALNUT SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup. Put a row of walnut halves around the cone of cream until it is covered, and place on the top either a fresh candied or a maraschino cherry.

HICKORY NUT, PECAN, AND ALMOND SUNDAE.

This is prepared in the same manner as the English walnut sundae, only using the specified nut meats.

COMBINATION NUT SUNDAE.

This may be prepared from any two kinds of nuts. For example, a pecan almond sundae is prepared by first placing a row of pecans, and then one of almonds, around the cone, and so on until it is covered, crowning it with a cherry.

CINNAMON PEAK SUNDAE.

Put a No. 8 cone of vanilla ice cream into a sundae cup, and sprinkle with powdered cinnamon. Cover the cone with mixed chopped nut meats and top with a little whipped cream and a maraschino cherry.

CLEVELAND CHOCOLATE SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup, and sprinkle with chopped nut meats. Around the base place three or four slices of orange. Top with whipped cream, and crown with a maraschino cherry.

CONNECTICUT NUT SUNDAE.

Put a No. 10 cone of ice cream into a sundae cup and sprinkle with a little powdered nutmeg and cover with chopped nut meats. Top with a little whipped cream, and drop a few pistachio nuts into the cream.

DUNCE CAP SUNDAE.

Put a No. 10 mound of ice cream into a sundae cup; pour over it a ladle of any desired crushed fruits, and sprinkle with chopped nut meats. Fill a small ice-cream cone with whipped cream, and invert it on the mound of ice cream.

GRAPE FLOAT SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup, and pour over it one-half ounce of ice-cold grape juice. Then sprinkle with chopped walnuts or other chopped nut meats, and crown with a maraschino cherry.

ITALIAN SUNDAE.

Put a No. 10 cone of strawberry and chocolate ice cream into a sundae cup. Over this pour a ladle of chop suey dressing. Top with whipped cream, and crown with a large, fresh strawberry.

JOSEPH'S COAT.

Put a No. 10 cone of vanilla, strawberry, and chocolate ice cream into a sundae cup, or fruit nappie. Slice one-half banana around the base. Next place a row of maraschino cherries. Above this arrange a row of Hawaiian pineapple cut in small V-shaped pieces. Cover the top of the cone with assorted nuts, and top with a maraschino cherry.

LONE STAR SUNDAE.

Put a No. 8 cone of vanilla ice cream in a sundae cup. Over this pour some chocolate syrup, and then cover with a mixture of pecans, almonds, and dates, chopped together.

FIG-NUT SUNDAE.

Put a No. 10 cone of vanilla ice cream into a sundae cup, and pour over it a little fig-dressing, sprinkle with chopped walnuts, and top with whipped cream. A walnut fig dressing may be used.

POPULAR SODA FOUNTAIN BEVERAGES.

APOLLINARIS FIZZ.

Orange syrup1 fluidounce.
Strawberry syrup1 fluidounce.
Lemon juice1 fluidounce.
Cracked ice¼ glassful.
Apollinaris water to fill a 12-ounce glass.

Mix and serve with straws.

GRAPE PUNCH.

Put 1 ounce of orange syrup into an 8-ounce glass, add the juice of half a lemon, half an ounce of grape juice, a small amount of ice, and fill the glass with the coarse stream of carbonated water.

HAZELNUT ICE CREAM.

Roast 5 ounces of hazelnuts to a light brown, then remove the skins, which may be done by rubbing in a towel and subsequent sifting. Then make a pulp of the nuts by rubbing them in a mortar with milk. Heat one gallon of cream with two pounds of sugar, and just before the mixture comes to a boil add the nut paste and the yolks of 12 eggs, the latter being previously beaten up with some cream. Pass all through a fine sieve and freeze in the usual manner.

MARSHMALLOW DELIGHT.

Ice¼ glassful.
Almond syrup1 fluidounce.
Raspberry syrup1 fluidounce.
Egg1.
Milk, to fill a 12-ounce glass.

Shake, strain, and fill the glass with carbonated water.

MILK AND SELTZER.

In serving this drink, fill half the glass with the coarse stream of carbonated water, then fill with milk. Do not reverse the process as too much foam will be produced.

MILK SHERBET.

Strawberry syrup1 fluidounce.
Pineapple syrup1 fluidounce.
Vanilla syrup1 fluidounce.
Shaved or cracked ice½ glassful.
Milk, to nearly fill a 12-ounce glass.

Shake well, strain into a 12-ounce glass, fill the latter with the fine stream of carbonated water, and serve with straws.

NIAGARA MIST SYRUP.

Strawberry extract1 fluidrachm.
Vanilla extract2 fluidrachms.
Cream1 pint.
Soda syrup2 pints.

Serve like other soda syrups, or with cream or ice cream.

ORIENTAL NECTAR.

Sherbet syrup1 fluidounce.
Red orange syrup½ fluidounce.

Fill an 8-ounce glass half full of crushed or shaved ice, add the above syrups, fill the glass with coarse stream of carbonated water, stir well, and serve with straws.

ROSE TULIP PEACH.

Rose syrup6 fluidrachms.
Pineapple syrup4 fluidrachms.
Orange syrup4 fluidrachms.
Cream4 fluidounces.
Cracked ice¼ glassful.

Shake, strain into a 12-ounce glass, nearly fill the latter with the coarse stream of carbonated water, finish with the fine stream, and top with whipped cream.

COFFEE FRAPPE.

Coffee syrup2 fluidounces.
Vanilla syrup4 fluidrachms.
Cream2 ounces.
Cracked ice¼ glassful.

Shake with about 8 ounces of plain water, strain into a 12-ounce glass, and fill the latter with the fine stream of carbonated water.

DERBY WINNER.

Into a 12-ounce glass draw 2 ounces of orange syrup. Into this break an egg and add 1 ounce of

cream, about a tablespoonful of port wine, and some finely shaved ice. Shake thoroughly and fill with carbonated water as directed for egg drinks. Strain into a glass and serve.

COFFEE NUT SUNDAE.

Walnuts	4 av. ounces.
Hickory nuts	2 av. ounces.
Almonds	2 av. ounces.
Filberts	2 av. ounces.

Mix, chop into small pieces, and mix with a suitable amount of coffee syrup. Serve this like other sundaes. The latter may be topped with whipped cream.

CREAM SHAKE.

Cream	2 fluidounces.
Chocolate syrup	1 fluidounce.
Orange syrup	4 fluidrachms.

Fill a 12-ounce glass one-fourth with cracked ice, add the syrups and cream, and enough milk to fill the glass. Shake well, strain, and serve with straws.

RASPBERRY DASH.

Raspberry syrup	1 fluidounce.
Cream	1 fluidounce.
Tincture Jamaica ginger	1 dash.
"Acid phosphate"	1 dash.
Cracked ice, a small piece.	
Egg	1.

Mix all with about 4 fluidounces of water, shake well, strain into a 12-ounce glass, and fill the latter with the fine stream. Serve with straws.

EGG ORANGE MALTED MILK.

Orange syrup	4 fluidrachms.
Plain water, or milk	4 fluidounces.
Cracked ice, a small piece.	
Egg	1.
Malted milk	1 tablespoonful.

Shake vigorously, strain into a 12-ounce glass, nearly fill the latter with the coarse stream of carbonated water, and finish with the fine stream.

FRUIT AND NUT DRESSINGS FOR SUNDAES.

The *International Confectioner* recently published several formulas for fruit and nut dressings that are used in sundaes. We are pleased to print several of them, as follows:

FIG-NUT DRESSING.

Run eight ounces of figs through a fruit chopper, add one pint of simple syrup, and bring to a boil. Allow this to simmer for a few minutes, until the figs are soft. When cold, add eight ounces of mixed chopped nut meats. If too heavy, reduce to a working consistency with a simple syrup. Fig-nut dressing is also very nice when prepared with maple syrup. The figs may be incorporated with the syrup without cooking, if desired; but it does not make, to our mind, as rich a dressing. In serving, top with whipped cream.

PECAN FIG DRESSING.

Run one pound of figs through a fruit chopper, and add one-half gallon of maple syrup. Add one-half pound of pecan nut meats chopped fine, and boil for fifteen minutes. When cold, add enough lemon to flavor the mixture nicely.

CENTRAL FRUIT DRESSING.

Run one pound of English walnuts and one pound of pecan nut meats through a fruit chopper with one-fourth pound of powdered sugar, using the fine cutter. Dilute to a working consistency with simple syrup. This may be colored pink, if desired.

NABISCO NUT DRESSING.

Grind one-half pound of pecans, add with one pound of sugar to a quart of heavy cream, and heat to the

boiling point. When cold, add one-half ounce of vanilla extract and eight ounces of crushed pineapple. Four ounces of marshmallow whip can be used in place of the vanilla, and this produces a fine dressing.

TWO EXCELLENT ADS.

Wm. A. Chamberlin, of Collingwood, New Jersey, issues a weekly bulletin, a little store paper covering news of his pharmacy. We are reproducing two of the

ATTENTION
All Ye Lovers of
FINE SODA

WOULD YOU ENJOY something exquisitely luscious? Do you crave a drink of soda water that is the acme of perfection in deliciousness, in freshness and in purity and wholesomeness?
THEN LOSE NO TIME in visiting our store and regaling yourself with your favorite drink from the many tasty soda delights we are now serving to the enthusiastic enjoyment of our thirsty patrons.

OF QUALITY

John Ruskin said: "All works of **QUALITY** must bear a **PRICE** in proportion to the skill, time, expense and risk attending their invention and manufacture."
"Those things called dear are, when justly estimated, the cheapest; they are attended with much less profit to the artist than those things which everybody calls cheap."
"Beautiful forms and compositions are not made by choice, nor can they ever, in any material, be made at small expense."
"A competition for **CHEAPNESS**, and not for **EXCELLENCE** of workmanship, is the most frequent and certain cause for the rapid decay and entire destruction of arts and manufacture."

ads. that appeared in Mr. Chamberlin's publication. They are above the average and will be found useful by our readers.

A RETAIL DRUGGIST USES BILL POSTERS.

One of the most unique ads. that has come to our attention in a long time is being used by B. S. Cooban & Co. of Chicago. It is a large bill-board poster 23

COOBAN'S
CRUSHED
STRAWBERRY
ICE CREAM SODA and SUNDAE
22% Cream, Sugar and Vanilla
TOPPED OFF WITH
FRESH STRAWBERRY
B. S. COOBAN & CO.
DRUGGISTS
459 W. 63d Street, cor. Normal Boulevard

inches wide and 3½ feet high. The paper is white, the lettering being done in red and blue. This ad. was presumably posted on all the bill-boards in the neighborhoods that contribute to the Cooban store.

BUSINESS HINTS

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

Two Interesting Window Displays.—

James L. McAnlis, Ph.G., manager of the Physicians' Pharmacy Co., Youngstown, Ohio, is particularly

interested in the subject of window trimming. He sends us two displays recently exhibited in his windows, and both of them are characterized by simplicity and effectiveness. Mr. McAnlis remarks that druggists as a rule do not pay sufficient attention to window trim-

ming and card writing. In his judgment this division of the business has been very much neglected, except among the larger stores in the cities, where regular trimmers are employed.

Baby Supplies in the Window.—

An original display of nursery supplies appeared in the window of J. F. McCreery, of Fonda, Iowa, having been arranged by G. W. Lyman.

In the center of the window stood a "stork," or

rather a sand-hill crane that had been mounted. Hanging from its beak was a sling in which rested a baby doll. The picture of a child was placed behind the bird, while two pictures of a baby were suspended from above.

The floor was covered with talcum powder, castoria, nipples, milk bottles, and other things a baby might

need. To the left appeared a sign: "Give the little suckers a chance."

The display did the store some good.

Duplicate Prescription Blanks.—

The prescription pads distributed by R. W. Love, of Saskatoon, Sask., among the doctors in his vicinity are quite a departure from the style usually adopted for

G. R. PETERSON, M.D.	
Office: MacBeth Block, Phone 255

such stationery. Each blank is perforated, dividing it into two sections. The doctor writes the prescription on one half, retaining the other as a record of the case.

CAPSULES OF SCIENCE

Prepared by PROF. W. L. SCOVILLE.

Compressed Tablets.—

H. E. Ives says that the firefly has a light efficiency 20 to 25 times as great as an electric arc light.

Professor Arrhenius calculates that a decrease of 50 per cent of the carbon dioxide in the atmosphere would give the temperature of the glacial period.

Mr. J. Liddell says that "any bosh-cooled pig is likely to contain moisture"—but he is talking about pig copper!

Alcohol vapor at a pressure of $\frac{1}{3}$ to $\frac{1}{2}$ atmosphere will destroy the enzymes in leaves in from one to two minutes.

Malt extract inverts cane sugar, but the action is very slow, occupying five to six months or more.

The liver contains an enzyme which oxidizes alcohol to acetic acid, then to carbon dioxide and water. The liver of man contains less of this enzyme than that of some animals.

A patented washing compound in the market in England, consists of 35 per cent sodium perborate, 45 per cent paraffin, and 20 per cent stearic acid.

By biological tests, one part of soap-tree bark in 400,000 can be detected.

Professor Hatcher says that *Cactus grandiflorus* does not possess any pharmacological action and is useless as a medicine.

R. C. Cowley says that ammoniocitrate of iron is really ammonium ferrocitrate—the iron being in the acidic condition.

Dr. G. H. Clark says that chloroform in repeated small doses, if long continued, lowers the vitality of the tissues and is a much more dangerous drug than when given in single and large doses.

F. Hart thinks that fossil wood is formed by the absorption of clay in water-suspension, which then decomposes into alumina and silica in the woody fibers and so petrifies the latter.

Two wise men say that liquid water is a ternary mixture of steam, water, and ice molecules— H_2O , $(\text{N}_2\text{O})_2$, and $(\text{H}_2\text{O})_3$.

Hydrocyanic acid is found in 40 families of plants, and saponin in 70 families. Both together are found in 20 families.

In fermentation by yeasts, the presence of nitrates increases the yield of alcohol and the activity of fermentation, but hinders the growth of the yeasts.

The commission of scientists of Bordeaux which has been studying the effect of sulphurous acid in wine on the human system, concludes that in doses up to 6 grains it is "perfectly harmless."

Borax and Glycerin.—

Wm. Duncan, Philadelphia, says that when one molecule of borax is added to two molecules of glycerin a neutral solution is obtained which consists of sodium glyceryl-borate, $\text{NaC}_3\text{H}_7\text{OHBO}_3$, and boric acid. If four molecules of glycerin are added to one of borax the mixture contains sodium-glyceryl-borate and gly-

ceryl-boric acid: $\text{Na}_2\text{B}_4\text{O}_7 + \text{OH}_2\text{O} + 4\text{C}_3\text{H}_5(\text{OH})_3 = 2\text{NaC}_3\text{H}_7\text{OHBO}_3 + 2\text{C}_3\text{H}_7\text{OHBO}_3 + 13\text{H}_2\text{O}$. This glyceryl-boric acid is a much more energetic chemical agent than boric acid, and causes active effervescence with carbonates, liberates iodine from iodides, etc. On dilution with water glyceryl-boric acid is hydrolyzed to glycerin and boric acid, which is much less active chemically.

Disinfectant Soaps.—

W. Schranth says that disinfectants of an acid character, as phenol, cresol, resorcinol, etc., are not effective in soaps unless used in large amounts, because they are neutralized by the alkaline character of the soaps. But when used in excess the disinfecting power is increased by the soap. Thus a 50-per-cent phenol soap in 4-per-cent solution is as active as a 5-per-cent solution of phenol alone. Tar soaps containing high percentages of tar are not good disinfectants because they are not alkaline enough.

About Sterilizing.—

Violet rays from a mercury vapor lamp have been used successfully to sterilize medicinal solutions. Mercury, quinine, cocaine, morphine, guaiacol, and several arsenic solutions are easily sterilized in this way without injury. Apomorphine, eserine, and silver solutions are darkened by violet rays. Serums can also be sterilized by exposure to these rays.

A New Treatment.—

The injection of colloidal silver solution into the veins has been shown to inhibit the development of streptococcus infection and to promote resistance to tetanus, diphtheria, and dysentery toxins. Colloidal silver solutions are strongly antiseptic, and under proper conditions are tolerated in the body in very decided antiseptic amounts.

Aids to Digestion.—

The character of the acid which is associated with pepsin influences its digestive power. Hydrochloric acid aids the most, then come in order nitric, oxalic, phosphoric, sulphuric, tartaric, lactic, citric, acetic, and boric acids. Oxalic acid thus appears to be a better aid to protein digestion than the more common fruit-acids—citric, tartaric, etc.

Label, Libel, or Liable.—

Pantopon is a mixture of all the alkaloids of opium, in hydrochloride form, which is readily soluble and is stated to have all the hypnotic and analgesic properties of opium without its nauseating or constipating effects. It is claimed to be effective sometimes where morphine fails.

About Thunderstorms.—

C. G. Simpson accounts for thunderstorms by proving that the breaking of large drops of water into spray (such as must occur in storms) imparts a considerable positive electric charge to the water.

Dainty Wiping.—

Two Harvard chemists state that when one has a liquid too volatile to be dried in a desiccator and too small in amount to be distilled, it may be dried by wiping with slightly moist filter paper.

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Exterminating Ants.

J. H. K.—Ants in the lawn, garden, or field are easily destroyed by digging a sharp stick into the center of the hill and pouring into it from 1 to 4 ounces of carbon bisulphide, then pressing the soil together again. The best time to thus destroy ants is immediately after a rain, when the ground is cool and damp and there is less rapid volatilization of the sulphide.

As for ants in the house, the following method has been suggested: Take a sponge and soak it in water, so as to swell it; squeeze all the water out. Turn it around in your hand and sift granulated sugar on it. Place the sponge near the ant infested spot and the insects will soon be attracted to it. After the sponge is filled with the ants hook on it a weight sufficiently heavy to pull it under water. Place the sponge in a pail or other vessel and let it sink. All the ants will get out and come to the surface, where they may be skimmed out and thrown into boiling water, or destroyed in some other effective way. Squeeze the water out of the sponge and dose it again with sugar. It will not take long to rid any place of ants, whether lawn or dwelling. The method is clean, safe, and is not troublesome.

The nests of the ants in the walls of the house or beneath the flooring are often difficult to reach, yet the headquarters of the marauders must be located if permanent respite from their ravages is to be obtained. If the nest is in the wall it is often possible to locate it by following the workers back to their place of entrance. In this case they may sometimes be reached by injecting bisulphide of carbon. Kerosene can also be forced in through a long-necked can. If the trouble is in the floor it is sometimes possible to get to them by taking up a section of the flooring.

If their stronghold is a little hill near the foundations of the house a kettle of boiling water or kerosene poured in the opening will exterminate them. An abundance of cold water applied with the garden hose on a lawn will discourage permanent residence. Meanwhile invest in the purest, strongest Cayenne pepper you can find in the market. Sprinkle thoroughly on all pantry shelves near the edges or under the oil-cloth or paper covers. Before using the Cayenne scald the shelves with boiling water and wipe dry. This scalding and treating with Cayenne may have to be repeated several times before making an effectual clearance. Often the window sills leading into pantry or dining-room from outside will be found in the track of travel and require the Cayenne treatment also. As

a further discourager to entrance move your sugar box or barrel to a new place for a while. This seems to puzzle the invaders and balk their plans.

J. M. Flynn, of Elburn, Illinois, says that he has taken a string or piece of tar rope, saturated it with oil of tar or pine tar, hung it about the shelves, and the ants have immediately left and not returned while there was any odor of the tar. We do not know that this would work with the small red ants, but Mr. Flynn has always found it satisfactory with the black ants.

Board-of-Pharmacy Secretaries in the United States.

F. L. W.—Here is the full list of secretaries:

Alabama—E. P. Galt, Selma.
 Arizona—A. G. Hulett, Phoenix.
 Arkansas—J. F. Dowdy, Little Rock.
 California—Louis Zeh, San Francisco.
 Colorado—S. L. Bresler, Denver.
 Connecticut—J. A. Levery, Bridgeport.
 Delaware—Albert Dougherty, Wilmington.
 District of Columbia—S. L. Hilton, Washington.
 Florida—D. W. Ramsaur, Palatka.
 Georgia—C. D. Jordan, Monticello.
 Idaho—T. M. Starrh, Shoshone Falls.
 Illinois—F. C. Dodds, Springfield.
 Indiana—W. H. Rudder, Salem.
 Iowa—Ed. J. Moore, Des Moines.
 Kansas—W. E. Sherrieff, Ellsworth.
 Kentucky—J. W. Gayle, Frankfort.
 Louisiana—Fred A. Earhart, New Orleans.
 Maine—Frank W. Bucknam, Skowhegan.
 Maryland—Ephraim Bacon, Roland Park.
 Massachusetts—P. J. McCormick, Boston.
 Michigan—Ed. J. Rodgers, Port Huron.
 Minnesota—Charles T. Heller, St. Paul.
 Mississippi—L. H. Wilkinson, Greenwood.
 Missouri—Charles E. Zinn, Kansas City.
 Montana—T. M. Kehoe, Billings.
 Nebraska—Frank Koss, Fremont.
 Nevada—R. L. Prouty, Tonopah.
 New Jersey—Henry A. Jordan, Bridgeton.
 New Hampshire—Frank H. Wingate, Nashua.
 New York—Warren L. Bradt, Albany.
 New Mexico—A. J. Fischer, Santa Fe.
 North Carolina—F. W. Hancock, Oxford.
 North Dakota—W. S. Parker, Lisbon.
 Ohio—Frank H. Frost, Columbus.
 Oklahoma—J. C. Burton, Stroud.
 Oregon—Clyde G. Huntley, Oregon City.
 Pennsylvania—Lucius L. Walton, Williamsport.
 Rhode Island—James E. Brennan, Pawtucket.
 South Carolina—Frank M. Smith, Charleston.
 South Dakota—E. C. Dent, Dell Rapids.
 Tennessee—Ira B. Clark, Nashville.
 Texas—R. H. Walker, Gonzales.
 Utah—Walter H. Dayton, Salt Lake City.
 Vermont—D. A. Davis, Barre.
 Virginia—T. A. Miller, Richmond.
 Washington—P. Jensen, Fernhill.
 West Virginia—Alfred Walker, Sutton.
 Wisconsin—Edward Williams, Madison.
 Wyoming—C. B. Gunnell, Evanston.

Three Difficult Mixtures.

E. B. submits three prescriptions with the request that we discuss them:

- (1) Spirit of turpentine.....½ pint.
 Olive oil½ pint.
 Camphor2 ounces.
 Sulphuric acid.....2 fluidounces.

Add the acid carefully a little at a time to the turpentine. When the heat has abated add the camphor and then the oil. Agitate and dispense with a shake label, because part of the sulphuric acid may remain out of solution.

- (2) Sodium sulphite50 grains.
 Diluted phosphoric acid.....½ fluidounce.
 Tincture of ferric chloride.....½ fluidounce.
 Syrup enough to make.....4 fluidounces.

Mix.

Dissolve the ferric chloride tincture in the syrup, add the acid and then the sodium sulphite. There may

be a slight odor of sulphur dioxide liberated from the sodium sulphite, but not enough to do any harm.

- (3) Mercuric chloride1 grain.
Tincture of ferric chloride.....3 fluidrachms.
Spirit of vini Gallici.....6 fluidrachms.
Elixir of lactated pepsin enough to
make4 fluidounces.

Mix.

In this mixture an ink will form, due to a reaction between the tannic acid in the wine and the iron. The prescription filled is unsightly.

Removing Tattoo Marks.

F. C. W.—The following method of removing tattoo marks is suggested by Henley's Book of Formulas:

Apply a highly concentrated tannin solution on the tattooed places and treat them with the tattooing needle as the tattooer does. Next vigorously rub the places with a lunar caustic stick and allow the silver nitrate to act for some time, until the tattooed portions have turned entirely black. Then take off by dabbing. At first a silver tannate forms on the upper layers of the skin, which dyes the tattooing black; with slight symptoms of inflammation a scurf ensues, which comes off after fourteen to sixteen days, leaving behind a reddish scar. The latter assumes the natural color of the skin after some time. The process is said to have given good results.

Since this method is borrowed from the literature, we are in no way responsible for any untoward results following its use.

For Perspiration.

L. B. wants a formula of a preparation that may be used "to deodorize perspiration."

Several formulas have been suggested for the treatment of odorous perspiration:

- (1) Zinc oleate4 drachms.
Boric acid3 drachms.

Mix. Keep the surface constantly covered with the powder.

- (2) Hydrastine hydrochloride.....5 grains.
Cologne water.....4 fluidounces.

Apply frequently to the surface.

- (3) Zinc oleate½ ounce.
Powdered starch1 ounce.
Salicylic acid20 grains.

Where the perspiration is not especially odorous you might try the following formula for a facial preparation:

- Lavender water50 grammes.
Lemon water50 grammes.
Peppermint water50 grammes.
Tincture of myrrh.....50 grammes.
Tincture of quillaya.....50 grammes.
Sodium carbonate20 grammes.

Three times daily moisten a portion of a napkin, dipped in water and wrung out, with the above mixture from a dropping bottle and wash the face with it.

For the hands and feet the following formula is suggested:

- Prepared Venetian talc.....20 ounces.
Powdered orris root.....10 ounces.
Oxide of zinc.....5 ounces.
Powdered tartaric acid.....5 ounces.
Powdered boric acid.....5 ounces.
Salicylic acid2½ ounces.
Menthol¼ ounce.
Oil of eucalyptus.....¼ ounce.

Make a fine powder to be applied to the hands and feet, or to be sprinkled inside the gloves or stockings.

As for the proprietary mixture you mention, we do not know its composition.

A Permanent Beef, Iron and Wine.

E. G. wants a formula for beef, iron and wine—one that will not sour. He adds: "I have tried the N. F. preparation and several others, but they all spoil."

The trouble must be due to using a wine of low alcoholic strength. Our querist is in a warm climate and needs to have the full alcoholic content in his preparation. If he will use a fortified wine—one containing not less than 16 per cent of alcohol—his beef, wine and iron will contain about 22 per cent of alcohol and will not sour under any conditions.

The N. F. preparation will be all right, or probably any other formula that he has tried. We suspect that his whole trouble has been due to using a light wine containing 6 or 8 per cent of alcohol.

A General Insecticide.

B. B. writes: "Kindly print a formula for a spray to be used in the house to keep flies away. I want something that can also be used as a general disinfectant."

THE COOBAN PHARMACY IN CHICAGO.—The readers of the BULLETIN of course know about B. S. Cooban, who has in times gone by contributed so many articles to this journal. We present here a "panoramic" view of his store. Inasmuch as it was made, however, by pasting two separate photographs together, and having them meet in the center, there is a little distortion of the lines which must be excused. Over the back room is a mezzanine gallery scarcely distinguishable in the photograph, and up here in this aerie Mr. Cooban has his desk.

tant for killing chicken mites and vermin of that kind. I want something that won't stain fabrics."

Use a one-per-cent solution of compound solution of cresol U. S. P. The preparation has a coal-tar smell which passes away in the course of a day. A one-per-cent solution ought not to injure fabrics, although it would be advisable to try the liquid on a restricted part of the cloth first. Make up a one-per-cent solution and apply it with a sprayer.

Tire Cement.

J. L. writes: "Please publish a formula for making rubber cement to repair the inner tubes of automobile tires; also one to fill cuts in the outer casing."

The following formulas for bicycle tire cements may serve for the repair of the outer casing if the hole is small. Of course to fix a rent or tear, it is necessary to vulcanize the tire:

Gutta percha.....½ ounce av.
Caoutchouc.....1 ounce av.
Carbon disulphide.....8 fluidounces.

Mix and dissolve.

This cement is dropped into the crevices after they have been properly cleaned. If the hole is big, apply the cement in layers. Bind up the rubber tire lightly with thread, let it dry for twenty-four to thirty-six hours, cut off the thread and remove the protruding cement with a sharp knife previously dipped in water.

Here is another formula:

Caoutchouc.....6½ ounces av.
Resin.....1 ounce av.
Lemon water.....50 grammes.
Carbon disulphide, enough to dissolve the other ingredients.

Use like the first formula.

To repair the inner tube, wash off the injured area with gasoline or sandpaper the surface about the puncture. Then apply the cement. Having also wet the rubber patch with the adhesive, stick it on the tire just over the hole. Apply pressure till the cement dries.

Kola Soda Syrups.

R. D. Co. wants a formula for kola soda syrups. Here are two:

- (1) Kola wine8 ounces.
Coca wine4 ounces.
Blackberry brandy1 ounce.
Lime juice1 ounce.
Raspberry juice (from fresh fruit)....4 ounces.
Rock-candy syrup8 ounces.

Serve one ounce to a mineral glass, with a little ice.

Wine of kola is made by percolating one ounce of the ground fresh kola-nut with ten ounces of sherry wine.

- (2) Kola cordial4 drachms.
Coca cordial1 ounce.
Calisaya cordial1 ounce.
Muscatel wine1½ ounces.
Frothing mixture2 drachms.
Raspberry syrup12 ounces.

Trim with fresh white grapes.

Removing Paint from Fabrics.

K. J. D.—Gasoline or benzine will take the oil of the paint out, and the paint pigment can then usually be removed by the use of warm water and soap-suds.

If this doesn't prove successful after a fair trial,

use chloroform very carefully—a little at a time on a cloth.

If the chloroform fails alcohol might do the work.

As a last resort make a mixture or emulsion of ammonia, two parts, and turpentine one part. Shake this up thoroughly and use with a cloth.

Sometimes if the paint is old or dry it is desirable to soften it up pretty well with olive oil or butter, and then go ahead with the removers.

A Difficult Capsule.

H. W. submits the following prescription, saying that he has tried all kinds of ways to fill it without success:

Acid sodium oleate.....1½ drachms.
Salicylic acid1½ drachms.
Phenolphthalein1 drachm.
Menthol15 grains.

Mix and make 60 capsules.

Add 200 grains of corn-starch to the formula. Mix the four medicinal ingredients together first, obtaining a semi-liquid mass. Then use starch as a drying powder and fill the capsules.

A Menthol Ointment.

E. L.—We do not know the composition of the proprietary mixture which you mention, but the following formula of a menthol ointment appears in the literature. Suppose you try it:

Camphor20 grains.
Menthol30 grains.
Thymol10 grains.
Boric acid15 grains.
White wax2 drachms.
White petrolatum, enough to make...8 drachms.

Glycerite of Pancreatin.

J. R. S. complains that he has not been able to get a good working formula for glycerite of pancreatin.

Squire's Companion to the British Pharmacopœia suggests the following formula:

Pancreatin10 parts.
Glycerin50 parts.
Simple elixir5 parts.
Distilled water enough to make.....100 parts.

Mix all and filter.

Fly-bane for Cattle.

J. W. B. wants a formula of a good preparation to keep flies off cows. One of our correspondents has found the following formula an excellent one to keep flies off horses and cattle:

Oil of pennyroyal.....4 drachms.
Oil of lavender.....2 drachms.
Carbolic acid1 drachm.
Fish oil enough to make.....1 pint.

Coloring Liquid Glass.

J. H. B. wants to know a dye that may be used to color liquid glass a pink color.

We suggest acid ruby.

K. R. T.—We do not know the composition of the proprietary salve which you mention.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., AUGUST, 1911.

No. 8.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	\$1.00 per year
Foreign countries,	1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.

378 ST. PAUL STREET, - - MONTREAL, QUE., CAN.

19 AND 20 GREAT PULTENEY STREET, W., LONDON, ENG.

125 YORK STREET, - SYDNEY, N. S. W., AUSTRALIA.

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY

THE WILEY-RUSBY INCIDENT. The Wiley-Rusby entanglement, which was one of the newspaper sensations last month, seems to us a tempest in a teapot. It is scarcely necessary to repeat the facts, for they have been given wide publicity by the daily press from one end of the country to the other. Briefly, Dr. Rusby, as one of the outside pharmacognosists in the employ of the Department of Agriculture at Washington, working under Dr. Wiley in the enforcement of the food and drugs act, was originally paid at the rate of \$20 a day for laboratory work and \$50 a day as an expert in court trials. Later, Congress passed a law providing that government scientists should not receive to exceed an amount per diem which, extended through a full year, would amount to more

than \$3500. This meant a daily recompense of about \$9.

This so cut down Dr. Rusby's payment that he was actually losing money, particularly when away from home doing work as a court expert. He therefore notified Dr. Wiley that he would have to resign from the government service. Dr. Wiley was very anxious to retain his services, however, and after further correspondence with Dr. Rusby the latter declared that he was satisfied to accept the \$9 a day payment for laboratory work as a pharmacognosist, but he would have to receive \$50 a day when serving as a court expert. Even the \$50 figure was only half the amount received by him ordinarily for this service. Thereupon, it seems, Drs. Bigelow and Kebler, assistants of Dr. Wiley, developed with Dr. Wiley's approval an arrangement by means of which Dr. Rusby's salary was placed at \$1600 a year, the understanding being that he was to work only as many days as this amount would pay for at the average rate of \$20 a day. It was assumed that this daily rate of \$20 would strike such an average that Dr. Rusby would get the legal \$9 a day when employed as a pharmacognosist and \$50 a day when employed as a court expert.

* * *

UP TO PRESIDENT TAFT.

It is now charged that the foregoing arrangement was an offense against the plain intent of Congress. The Committee on Personnel of the Department of Agriculture, comprising Assistant Secretary Willett M. Hays, Solicitor George P. McCabe, and Chief Clerk C. C. Clark, after making an investigation of the facts, declared that the arrangement with Dr. Rusby was plainly illegal, and recommended that Dr. Rusby be dismissed from the service, that Dr. Kebler be reduced in rank so that he could no longer have any authority in such matters, and that Dr. Wiley and Dr. Bigelow be permitted to resign. This report was referred to Attorney-General

Wickersham, who, after making an analysis of the testimony, approved of the recommendations of the Committee on Personnel. Secretary Wilson thereupon finally passed the whole matter along to President Taft without making any recommendation himself, though the President afterwards requested him to pass judgment on it.

We are quite willing to believe that the letter of the law was perhaps violated in the arrangement made with Dr. Rusby. It does seem to us as laymen, however, that this violation was almost a pure technicality. Certainly Dr. Rusby was not overpaid. On the contrary, he was underpaid, and he received less from the government than he was regularly receiving from other sources. Furthermore, as he makes convincingly clear in his reply, if any legal mistake was made in employing him, the responsibility must rest upon the officials of the Department of Agriculture. To punish Dr. Rusby for accepting the conditions offered by them would surely be rank injustice. Of Dr. Rusby's lofty sense of integrity no one has any doubt, and fortunately this will carry him through the present situation without any loss of prestige.

As we stated at the outset, the whole thing seems to us a tempest in a teapot. It made good newspaper copy, however, and it was therefore seized upon with avidity. Some of the New York papers devoted a whole page to the subject on the first day, and it may be that the Ballinger incident is to be repeated in the case of Dr. Wiley. At this writing the president is daily expected to make a decision in the matter, and this may issue before the present number of the BULLETIN reaches its readers.

* * *

IMPORTS OF SUB-STANDARD DRUGS. Two very important papers on the food and drugs act have recently been presented by Dr. H. H. Rusby before the Vermont and New York State Pharmaceutical Associations. The Vermont address we are printing elsewhere in the present issue of the BULLETIN. In the New York contribution a suggestion was advanced which is quite likely to cause more or less discussion during the next few months.

As one of the pharmacognocists in the service of the U. S. government Dr. Rusby is of course thoroughly familiar with the rulings

of the customs authorities touching the deportation of crude drugs which do not come up to the standards. Dr. Rusby argues with conviction that the rejection of shipments often is unnecessary and results in great injustice. Sub-standard botanical drugs have a very wide legitimate use: if, for instance, they are alkaloidal drugs, they can be employed for the extraction of the alkaloids; if they are oil-containing drugs, they can be used for the distillation of oil; lots containing an insufficient amount of active principle can be used for the preparation of solid extracts; and the drugs themselves, even if sold again in the crude state, can first be shorn of their admixtures.

In these and many other ways imports which do not conform to pharmacopœial standards may be used with perfect legitimacy, and Dr. Rusby pointed out, furthermore, that there were many drugs in the Pharmacopœia which should be treated as opium is treated: the U. S. P. provides that a sub-standard opium may be mixed with a super-standard specimen in order to produce a mixture having the proper percentage of alkaloid. Why shouldn't this principle be extended to other drugs?

* * *

**DR. RUSBY'S
UNIQUE SUGGESTION.**

On the other hand, however, Dr. Rusby declared that if importations of sub-standard and adulterated crude drugs were permitted to enter the country freely, there would be little or no guaranty that the proper degree of rectification would be made before they were placed upon the open market for sale. In some way the government needs assurance that the consumer will be protected. To this end Dr. Rusby made a unique suggestion in the following language:

It has long been clear to me that the Federal government should provide a building to which defective goods should be taken, provided with every possible facility for standardizing them, and that importers should be given the option of having such goods deported, as now provided for, or of having their defects removed by government employees, or under government supervision, at actual cost. In this case, the portions removed as worthless could be destroyed by the authorities and certificates of their percentage supplied, when so desired by the owner

Dr. Rusby admitted that when importations had thus been shorn of their adulterants it would still be possible for unscrupulous dealers

to resophisticate them before offering them for sale, but this would represent an entirely different offense, without extenuation or excuse traceable to the importer, and could be separately and severely dealt with. Whether the Rusby idea will prove upon further thought to be practicable, and whether it will be approved by even the honest dealers who are anxious always to do the square thing, will be better determined after more careful consideration has been given to the proposal.

* * *

ANNUAL MEETING OF THE CLERKS.

The first annual meeting of the new society of drug clerks known as the National Association of Pharmacologists was held recently in Columbus, Ohio. Mayor Marshall welcomed the delegates, and a speech was also made by Governor Harmon, upon whom a special committee called at the executive offices in the State Capitol. Reports were made by the various officers of the association, and it seemed to be generally agreed that the vital necessity just at present was to push the work of organization. So far State committees have been appointed in 25 States, with county committees organized in some instances. City branches are also under headway in places like Atlanta, Boston, Cleveland, Chicago, Louisville, Philadelphia, and several other leading centers.

During the past winter the N. A. P. has been active in legislative matters but succeeded only in securing the passage of the anti-sampling law in Ohio—a measure which has already been referred to in the BULLETIN. In the future particular attention will be paid to such violations of the law as leaving unregistered and incompetent help in charge of drug stores. Resolutions were passed providing that the next annual meeting will be held in Akron, Ohio, on the first Tuesday in September, 1912; that governors in the different States be furnished annually with the names of two members of the N. A. P., and asked to appoint one of them on the State Board of Pharmacy; that effort be made to secure recognition on the Revision Committee of the U. S. P.; and that a delegate be appointed to attend the forthcoming convention of the N. A. R. D. at Niagara Falls.

The newly elected officers are: president, D. N. Robin of Pittsburg; vice-presidents,

Charles H. Bowersox of Columbus, F. M. Blank of Akron, Ohio, Willard C. Gantz of Terre Haute, Ind.; secretary-treasurer, P. A. Mandabach of Columbus (re-elected). A. P. Johnson of Terre Haute is chairman of the National Auditing Committee, and Charles H. Bowersox is chairman of the National Publicity Committee.

* * *

SOME LEGISLATIVE SCRAPS.

Among the diverting features of several of the State association meetings this year have been lively scraps over legislative matters. These developed in at least three States—Illinois, California and Pennsylvania. In the former two States the contest was largely over the failure this past winter to enact a graduation prerequisite law, concerning which there are pro and con factions in each State. In both cases the fight is to be renewed and graduation prerequisite measures will again be introduced at the next sessions of the legislatures.

At the Pennsylvania meeting the contest was over a general bill which, introduced in the legislature last winter, represented a codification of the existing pharmacy and narcotic laws, and involved many new provisions as well. The draft was so comprehensive in nature, and contained so many provisions, that it was found almost impossible to get general agreement on everything, and as a result it failed of passage in the legislature this spring. John C. Wallace, the able and fearless chairman of the Committee on Legislation of the State association, read a report at the recent annual meeting giving a brief and interesting history of the winter's troubles over the measure, and in some supplementary remarks of an extemporaneous character he criticized Mr. P. W. Snyder, a member of the Legislative Committee and also a member of the legislature itself, for refusing to introduce the bill and to stand sponsor for it as he had promised.

The ensuing debate was one of great dramatic interest, in which Mr. Snyder defended himself and declared that there were several provisions in the measure which deserved further consideration at the hands of the State association. The final upshot of the whole matter was the adoption of a motion to refer the bill back to the Legislative Committee with instructions to make certain changes, and have

copies printed a month before the convention next year. Then, when the association has finally approved of the bill, and made such further changes as it may elect, everybody will be expected to turn in and work hard for the enactment of the draft into law at the hands of the State legislature.

* * *

THE A. M. A. MEETING.

The sixty-second annual meeting of the American Medical Association, held in Los Angeles, resulted in some surprises. The anti-administration party, which has apparently been developing strength of late years, succeeded in electing Dr. Abraham Jacobi of New York over Dr. J. N. McCormack of Kentucky. Dr. Alexander R. Craig of Chicago was elected general secretary to succeed Dr. George H. Simmons, although Dr. Simmons remains editor of the *Journal*. Of the resolutions adopted at the meeting, one declared against the issuance of patents on products and held that patents should be granted on processes of manufacture only. Another resolution approved of the Owen bill providing for the establishment of a national department of health. The action taken of greatest interest to pharmacists, however, was the adoption of a series of resolutions disapproving of medical dispensing except in cases of necessity, and declared at the same time that druggists should refrain from counter-prescribing and cooperate with the medical profession in the abolition of mutual evils.

* * *

THE STAMP-TAX BILL.

We have not had very much to say in the BULLETIN about the Sherley stamp-tax bill in the National Congress for the reason that we learned early that there was no danger whatever of this bill being taken up for consideration at the present special session. No action has been or will be taken upon it. It may possibly come up again at the regular session beginning with December, and for this reason it will be wise for the drug trade to organize its fighting forces.

Of course a measure of this kind, placing a discriminating tax on proprietary medicines and toilet articles, is highly unjust from every point of view. In the first place it is special taxation on a particular class in a community

—a class, moreover, which is already heavily taxed under internal revenue laws and the liquor and pharmacy acts of the several States. History shows that neither the manufacturer nor the jobber bears the burden but passes it along to the retailer on the assumption that he in turn will shove it off on the consumer. Since, however, the retail prices of proprietary articles are either printed on the package or are fixed by local custom, the retailer is unable to recoup himself and therefore has to stand the burden alone. In effect this practically amounts to an income tax of from 10 to 20 per cent!

No wonder, therefore, that nearly all of the State pharmaceutical associations this summer have passed warm resolutions against the Sherley bill. In Sherley's own State, that of Kentucky, the Pharmaceutical Association not only condemned the measure but appointed a committee of three, headed by Simon N. Jones, to appear before the Ways and Means Committee of the house and voice a protest against the measure.

* * *

TO AMEND THE FOOD AND DRUGS ACT.

As was to be expected, President Taft's eloquent appeal to Congress to amend the food and drugs act so that exaggerated therapeutic claims would come within the purview of the law, has caused the introduction of several measures looking toward this end. The simplest one is that of Representative Sherley, author of the stamp-tax bill, which simply adds a paragraph to the misbranding provision of the act declaring that any product will violate this section "if its package or label shall bear any statement, design, or device regarding the curative or therapeutic effect of such article which is false or fraudulent." This seems to cover the necessities of the case very briefly and adequately, without affecting the law in any other particular.

Some of the other bills, however, go much farther, supplementing the act in several particulars, and among other things adding 15 or 20 substances to the list of inhibited drugs which must be mentioned on the label. There seems to be a disposition to seize upon the present situation and amend the law generally, and if it develops far enough it will have the effect of killing the whole thing so far as the present special session is concerned.

The Democratic leaders seem opposed to the consideration of any subjects at the special session except those relating to the tariff and revenues, and in order to head off the present activity regarding the food and drugs act it is suspected that they are quietly planning to hold back the several amendatory bills until the close of the session and then pass one of them quickly just before adjournment. The session will probably close early in August and some action may possibly be taken by the time this number of the BULLETIN reaches its readers.

* * *

A good deal of excitement **A FAMILY QUARREL.** has been caused during the last few months by the growing differences between the American Druggists' Syndicate and the Chicago Wholesale Drug Co. The latter was originally a local branch of the A. D. S., but Mr. Goddard charges that after it became regularly incorporated as a coöperative jobbing house it began to look after its own interests at the expense of its former parent. The Chicago people reply that the discounts on many A. D. S. goods were too small, that the prices were often too high, and that there were frequent complaints on the score of quality from customers. The situation became more and more strained until finally Mr. Goddard cut off the C. W. D. Co. from A. D. S. supplies, and established several emergency depots in Chicago. The A. D. S. point of view is given in an article in a recent issue of *The Voice of the Retail Druggist*, prepared by Mr. Goddard, while the explanation of the Chicago Wholesale Drug Co. is contributed by Manager Matthew White to an issue of *C. R. D. A. News*. Charges and counter charges are made by the two gentlemen with a good deal of vigor.

* * *

There is now being considered by the A. Ph. A. a proposition to publish a general recipe book of miscellaneous formulas. A special committee, of which Otto Raubenheimer is the chairman, has recommended to the Council that such a book be published, and the subject will probably be discussed at the Boston meeting this month. In general the proposition seems to be to provide a place where the overflow from the U. S. P. and

the N. F. can be caught and kept. It has been feared by a good many people that many of the formulas in the N. F., for instance, were unscientific and undesirable in character, and those who originally brought forward the idea of a general recipe book thought this would provide an opportunity of removing such things from the N. F. and therefore from official and legal sanction.

* * *

THE N. A. R. D. CONVENTION.

Great plans are being made for the Niagara Falls convention of the N. A. R. D. in September. It is hoped to have this the largest and the best meeting of the entire series. *N. A. R. D. Notes* is authority for the statement that from present indications there will be at least twice as many delegates and visitors as the meetings have attracted before. The exhibit will be in the Cataract House, whereas the International Hotel will be used for headquarters. The two buildings adjoin one another and the convention hall and the exhibit hall are on the same floor in close proximity to each other. Judge Errant has recently proposed that one special session of the meeting be devoted to a thorough discussion of legislative matters, and the idea strikes us as being a good one.

* * *

The pharmacists of at least two States, Massachusetts and Indiana, are anxious to have one of their number on the State Board of Health. The Indiana association, at its recent annual meeting, voted to ask the governor to appoint F. W. Meissner, while the Massachusetts association sent three names to His Excellency with the request that he select one of them.

* * *

The New York State Pharmaceutical Association has voted to ask the legislature to pass a bill giving the name of "Wood Naphtha" to wood alcohol. This is in line with a Minnesota statute which has received the approval of the N. A. R. D.

* * *

William H. Gale, one of the old-time druggists in Chicago, and a man 77 years old, was unfortunately killed at a railroad crossing a few weeks ago.

EDITORIAL

THE NULLIFICATION OF STATE PROHIBITION AND ANTI-NARCOTIC LAWS.

In the July BULLETIN we showed how the State anti-narcotic laws were in many sections of the country practically nullified by the absence of a Federal statute. A State law applies only to the purchase and sale of narcotics within the borders of that particular State. A dealer a few miles away in an adjoining State, however, even if there be an efficient anti-narcotic law there also, may ship supplies across the border with perfect impunity. This is interstate commerce; it is carried on under the jurisdiction of the Federal government; and State laws do not apply in the least degree.

Recent developments show how this sort of thing works out in the liquor traffic. As a result of the wave of local-option sentiment spreading over the country during the last few years nearly one-half of the entire population of the United States, occupying about two-thirds of the geographical area, is now living in "dry" territory.

During all this agitation and voting out of the saloon, however, careful students of the movement have discovered that the total production and consumption of liquor, as reported upon annually by the Revenue Department at Washington, has diminished to a very slight degree. What is the explanation?

It now appears that the answer is largely to be found in the enormous development of interstate business done by mail-order liquor houses. The facts have come out as the result of a complaint made to the Interstate Commerce Commission by the Southern Mail-order Liquor Dealers' Association. This association thought it had a grievance because it was discriminated against by certain regulations of the express companies. It protested that the transportation charges for stone jars were based upon arbitrary and excessive weights, and were otherwise unfair and unjust. Commissioner McChord, who wrote the decision of the Commission, supported the contention of the association and held that the express companies might request that liquor packages be shipped in corrugated cartons, but declared that they could not discriminate so manifestly against stone jugs.

It is not the justice or injustice of this decision, however, to which we desire to call attention, but the mere fact that the Interstate Commerce Commission held itself powerless to do anything but recognize this illegitimate transportation of liquor into dry territory. Commissioner McChord declared that "the decision of the Supreme Court that this traffic was interstate, and therefore superior to interference by the State governments, had given the industry a tremendous impetus and established the express companies as the carriers of practically the whole of this traffic." The Commissioner closed his opinion with the significant statement that while it was not the function of the Commission to pass upon the moral aspects of the case, he nevertheless considered that this traffic "has an evil effect on and is one of the important factors in the race problem of the South."

During the course of this trial and from other sources it was discovered that the interstate mail-order houses are selling about twenty million gallons of liquor a year. Of course this is all being shipped into "dry" localities where the people have voted by small or large majorities to outlaw the liquor business. In other words, by means of the mixed jurisdiction of State and Federal governments, the people of a city, a county, or a State are unable to carry out their own will! Even in the prohibition State of Georgia it has been found that in the cities of Augusta and Savannah a mail-order whisky business is done annually to the extent of 215,150 gallons in the former town and 100,000 gallons in the latter.

This editorial is not written for the purpose of expressing any particular convictions on the liquor business. In times past we have argued that, whether or not the liquor traffic were allowed to continue, its place was not in the drug store; and we have sought to warn pharmacists against the very great danger to them involved in this temperance movement which drives liquor out of the hotels and saloons and forces the demand elsewhere. Our present object, however, is solely to point out the incontestable truth, more particularly with reference to the illegitimate sale of narcotics, that our present State laws are very largely rendered nugatory by the absence of a Federal statute regulating interstate commerce.

We in the drug trade ought to keep up our

agitation for a national anti-narcotic law. We can safely leave the demand for an interstate liquor law to those who are more directly interested in the abolition or restriction of the liquor traffic.

AMENDMENT PROPOSED FOR THE SHERMAN ACT.

Frank H. Freericks is one of those who believe that the recent decisions of the Supreme Court in the Standard Oil and Tobacco cases promise no relief in the elaboration of any plans which might be devised by the retail druggists of the country for the prevention of price cutting. The court has held in these two cases that a mere combination in restraint of trade was not in itself in violation of the Sherman act unless the restraint were unreasonable in character. Mr. Freericks believes, however, that the court was discussing, not restraints upon prices, but such restraints as follow upon a partial destruction of competition by the amalgamation into one concern of different companies in the same branch of industry or commerce.

The logical inference is, if Mr. Freericks is right, that any future attempt to apply such price-restraint measures in the drug trade as were represented by the old tripartite plan would still be held in violation of the Sherman act, despite the "light of reason" with which the act is now viewed by the Supreme Court. Whether Mr. Freericks is right remains to be seen. In any event he has drawn up some resolutions which have been adopted by the Ohio Valley Druggists' Association:

Whereas, The Supreme Court in its wisdom has found that the Sherman Anti-trust act (which under strict interpretation would make unlawful even the formation of a partnership enterprise) must be construed in the light of reason; and,

Whereas, Said law has been and may be used to stifle and prevent all coöperation among merchants to protect themselves against the ever-growing tendency of unlimited capital in the hands of one or a few to monopolize entire branches of trade or industry by temporarily underselling or otherwise; and,

Whereas, The continued welfare of our country depends upon maintaining and protecting the great middle classes (constituted largely of merchants with limited means), so that as a people we may not all be reduced to a state of hirelings, without opportunity for energy and ability alone to acquire or continue business independence; therefore be it

Resolved, That in view of the present agitation for an amendment to the Sherman Act, it is our judgment

that such proposed amendment should be drawn in the spirit which we believe prompted the original legislation, so that said legislation may not be used to crush smaller merchants and tradespeople, but permit them to enter into necessary agreements and coöperation for the purpose of protecting against greed and desire to monopolize.

Resolved, That a copy of these resolutions be sent to the President of the United States, to the Chief Justice of the Supreme Court, to the Governor of Ohio, to the United States Senators from Ohio, and to the members of Congress from the First and Second Districts of this State.

Other associations affiliated with the N. A. R. D. have been urged to take similar action, and it is quite likely that the subject will be brought forward for discussion at the Niagara Falls meeting of the N. A. R. D. in September. It might be well to consider, however, that such agitation as has developed in Congress or out of it, for the amending of the Sherman law since the Supreme Court decisions were rendered, has looked toward a tightening of the bars instead of a further loosening of them. It is therefore a little doubtful whether the present situation affords much possibility of legislative relief for the small merchants of the country.

The governmental ruling tabooing the use of saccharin in foods has been held in abeyance and will not go into force until January 1, 1912. In the meantime, however, it should be thoroughly understood by the drug trade that it only affects foods and *not* drugs.

An organization of drug clerks in New York City, known as the National Pharmaceutical Society, has at last succeeded in its purpose of getting one of its members appointed on the State Board of Pharmacy. John R. Wall is the lucky man.

Charles M. Ford of Denver, who enjoys a national reputation as a pharmacist, and is well known personally to many druggists, has been appointed Drug Inspector by the Colorado State Board of Health.

The directors of Billings, Clapp & Co. of Boston have decided to wind up the affairs of the business, and this action is now being taken.

THE HALL OF FAME

DEATH OF DR. BAIRD.

Dr. Julian W. Baird, dean of the Massachusetts College of Pharmacy, died recently at his home in Boston. The funeral services were held at the College building on St. Botolph Street and were attended by pharmacists and students. Dr. Baird had been with the College about 25 years. Always silent, retiring, and even taciturn, it was hard for the ordinary observer to get the measure of the man, but those who knew him intimately all spoke with real conviction of his strength and character. The late Dr. Prescott, under whom Dr. Baird was graduated at the School of Pharmacy of the University of Michigan, invariably spoke in terms of unwonted enthusi-

DR. JULIAN W. BAIRD.

asm of his former student. He was nearly always in attendance at the annual meetings of the A. Ph. A., but there he played his customary rôle of silent observer. His associates in the Massachusetts College deplore his loss greatly and feel that the withdrawal of his services is a severe blow.

A SUCCESSFUL SOUTHERNER.

Ernest Berger of Tampa, Florida, has a very successful business in that city, and during the last year has started the organization of a coöperative cigar factory among the

druggists of the country. Mr. Berger has been a member of the Florida State Board of Pharmacy for quite a number of years. From 1899 to 1906 he was secretary of the Board, and since 1906 he has been the president of it. He is also just now president of the Southern

ERNEST BERGER.

Association of Boards of Pharmacy, and is as well the first vice-president of the National Association of Boards of Pharmacy. In the meantime he is third vice-president of the American Pharmaceutical Association. Rather a choice collection of presidential honors to have at one time!

PROFESSOR ARNY SUCCEEDS DR. COBLENTZ.

One of the bits of personal news of the last month or two is the announcement, which has already been greeted with a good deal of interest, that Prof. Harry Vin Arny has been appointed successor to Dr. Coblenz as professor of chemistry in the New York College of Pharmacy. In order to accept this place Professor Arny leaves the deanship of the Cleveland School of Pharmacy, and his absence will doubtless be keenly felt in that institution. Not only has he conducted the affairs of the Cleveland College with a good deal of energy and even brilliancy, but he has been a leading figure in the pharmaceutical affairs generally of Cleveland and northern Ohio. For several years he has acted as secretary of the local association and has edited the official organ of that body. He has been an

officer likewise in both the Cleveland branch of the A. Ph. A. and the Medico-Pharmaceutical Section of the local medical society.

A hard and untiring worker, a man of unusual zeal and enthusiasm, he will certainly be an asset to the New York College of Pharmacy. Professor Arny is an alumnus of the

PROF. HARRY VIN ARNY.

Philadelphia College of Pharmacy, class of 1889, and he has a degree of Doctor of Pharmacy from the University of Göttingen in Germany. His treatise entitled "Principles of Pharmacy," a voluminous book, has already become well known, although but two or three years old.

DEATH OF SHERMAN R. MACY.

Sherman R. Macy, Dean of the Highland Park College of Pharmacy and Chemistry, died suddenly of heart failure on July 7 at his residence in Des Moines, Iowa. Professor Macy was born August 3, 1865, at Bloomfield, Iowa. He was graduated in pharmacy and chemistry from Northwestern University in 1890, and the year 1895 he spent in research work at Northwestern, which earned him the Doctor's degree. For twenty-one years he was associated with the Highland Park College. During this period he was for seven years State Chemist of Iowa, and in this capacity he appeared as an expert witness in behalf of the State at many murder trials involving poisons. Some years ago he had also served as State Chemist of Idaho for a time while seeking health in the mountains. During that period he organized the Idaho Pure Food and

Drug Board. His text-book on qualitative analysis is used by the Armour Institute and other prominent technical schools, and for over twenty years he had been a member of the American Chemical Society and the American Pharmaceutical Association.

DR. ANDERSON OUT OF THE RETAIL BUSINESS.

Considerable interest has greeted the announcement that Dr. W. C. Anderson has sold his store at 320 Lafayette Avenue in Brooklyn. He has presumably taken this step in order to give himself adequate time for the many other interests which engage his attention. Dr. Anderson is dean of, and professor of pharmacy in, the Brooklyn College of Pharmacy, and this alone must consume a good deal of his time. In many institutions

DR. W. C. ANDERSON.

such a position keeps a man busy of itself. In addition to this, however, Dr. Anderson has an executive position in the A. D. S., and, if we mistake not, is the New York State representative of the American Druggists' Fire Insurance Company. Apart from these remunerative employments he is always an officer or a committeeman of one or more pharmaceutical organizations, and it is doubtless to give himself time for these numerous interests and activities that he has decided to relieve himself of the routine duties of conducting a drug store.

The new main store of the Shaw Drug Co. in Denver, Colorado, is a very handsome and elaborate establishment. A portion of the salesroom is here indicated.

The Shaw store is located in the Metropolitan Building. This structure was erected for the exclusive use of physicians, and 80 of them have their offices in it.

Here we have a view of the prescription department of the Shaw Drug store in Denver. It is quite apparent from the size of the force that a very gratifying prescription business is enjoyed.

F. A. Patrick, Palestine, Texas, the proprietor of this store, is one of the veterans of the Civil War, and he frequently weaves in references to war matters in his advertisements.

Here we have the Red Cross Pharmacy located at 624 Commercial Street, Emporia, Kansas. The tables down through the center of the store indicate that a considerable soda business is done in this establishment.

Martin Luther (with a distinguished name which leaves little to be desired) is located in the pretty town of Kalamazoo, Mich. Kalamazoo is evidently famous for other things besides celery.

Some American Drug Stores.

N. E. Williams, of St. Louis, located in the Metropolitan Building occupied entirely by physicians, does practically nothing but a pure prescription business. This is a view of the waiting-room.

The Earl Drug Co. is located in Ridgway, Pa. The fixtures of this well-equipped place were installed by the Wilmarth Show Case Co. of Grand Rapids, Mich.

Adolph Bakst & Co. are the proprietors of this store at 230 Plain Street, Providence, R. I. From the signs on the front of the door it would seem that a specialty is made of the prescription business.

Here we have a partial view of the soda fountain of B. S. Cooban & Co., 63d Street and Normal Avenue, Chicago. Mr. Cooban gets 10 cents for ice-cream soda and does an enormous business in it.

W. J. Haynes is located in Breckenridge, Stephens county, Texas. It is somewhat unique to see pianos for sale in a drug store, but possibly this one was used for some other purpose.

Lee Williamson & Co. opened this beautiful new store in Baltimore not long since. It is within one block of the main shopping street and is connected with one of the leading theaters.

Some American Drug Stores.

Prof. Oscar Oldberg, retiring dean of the Northwestern School of Pharmacy, 7808 Union Avenue, Auburn Park, Chicago.

Charles H. Ward, chairman of the Executive Board of the California Pharmaceutical Association, Pasadena.

Howard Nichols, proprietor of "Walnutta Hair Stain," St. Louis, Mo.

A. H. Noble, Jr., together with Mrs. Noble, planned and built this home in Nashville, Tenn.

E. Berger, president of the Florida State Board of Pharmacy, occupies the second residence at the left.

O. P. McPherson, of Gloster, Miss., has a cottage at the "Health and Pleasure Resort of the Woodmen of the World."

Homes of Well-known Druggists.

Welcome to Boston!

John G. Godding will be conspicuous among the local hosts at the meeting of the American Pharmaceutical Association next month, and at the close of the convention will be installed as president of the organization for the coming year.

THE FOOD AND DRUGS ACT.

The Basic Principles Underlying It—Community Action taken by a Self-governing People to Protect Their Own Health and Pocketbooks—The Importance of Extending the Same Supervision Over Other Classes of Merchandise.*

By DR. H. H. RUSBY.

The Federal Food and Drugs Act of 1906 was based upon, and its character determined by, certain principles which are fundamental in our system of government. Upon the more general recognition of these principles, and upon farther and broader legislation based upon them, will depend, in great measure, the health and comfort of our people and even the continued success of our government. It is these principles and their applications which I wish to discuss to-day, rather than the specific provisions or the workings of this law.

OUR SYSTEM OF GOVERNMENT.

No law can be safely considered otherwise than in its relation to the particular form of government that is to administer it. We must therefore begin by reminding ourselves that the theory of our form of government is that we govern ourselves through certain individuals chosen from among and of ourselves, for the performance of specific duties which can be better performed by them for the entire community than by each individual for himself. The individuals thus selected together constitute the administration, commonly miscalled the government. In reality, we are ourselves the government.

The logical thinker will see that paternalism is not a possibility in such a government. If it were possible for our administration to engage in paternalism, then we must all be our own parents, for it would be a case of practicing paternalism upon ourselves. Whenever we hear a man complain that one of our laws, or its administration, is paternalistic, let us remember that while such influences may act under other forms of government, the expression is here necessarily self-contradictory. What such a critic usually means, though he certainly does not intend to publish the fact, is that he desires to engage in some course of

procedure that is unjust or otherwise injurious to his fellows, and that the law in question is doing exactly what it was intended to do, namely, protecting them against the execution of his design.

This protection may take the very mild form of preventing a profit so excessive as to be opposed to the public welfare, of insuring the quality of the goods called for by the contract, or the more serious one of preventing an absolute swindle or the furnishing of some article dangerous to life, such as a poison, a habit-forming drug, or a deadly weapon in the hands of children. Our courts have determined that it is even a proper function of such laws to prevent the formation or indulgence of immoral habits, against which many of our laws are directed, to protect young people. In all these cases, it is to be noted that the people have, after deliberation and discussion, decided that it is desirable and proper to unite in acting for the common welfare, and to appoint officials to take such action.

This is genuine coöperation. According to our socialist friends, it is socialism in its essential nature. These terms we need not discuss. Whatever name we apply to it, we must recognize that the principle involved is that government is justified in doing such things for all of the people as will be better done in that way, all things taken into consideration, than through individual action. We often hear people discussing the question whether certain acts constitute "proper functions" of government. I think it is not too much to say that, if the above principle is complied with, no legal act can be regarded as an improper function of government.

The expression "all things considered," here employed, of course requires careful attention and involves many considerations. If we go too far in substituting community for individual action, we may interfere with the proper strengthening and developing process

*An address delivered before the Vermont State Pharmaceutical Association and communicated to the BULLETIN OF PHARMACY by the author.

of the individual and we may interfere with personal freedom. In that case, the result is not being so well attained, "all things considered," by the government as it would be by the individual. In deciding such cases, it is imperative that we consider the nature and importance of the service, the relative practicability of its being performed individually or in common, and the extent to which community action will detract from a proper interest and activity on the part of the individual.

ITS APPLICATION TO THE FOOD AND DRUGS ACT.

Applying these tests to the act in question, we are called upon to consider (1) whether there is any necessity for the regulation of the food and drug trade, and, if so, (2) whether the people individually are as competent to regulate it as through officers of administration.

As to whether a necessity exists for the regulation of the trade in drugs, medicines and foods, it seems strange that there should be any question, yet it is by no means uncommon to hear the fact denied, so we may well consider the conditions which furnish an answer to this question.

In the purchase of such articles at first hand, both the seller and the purchaser are supposed to be exceptionally well informed as to the quality and price, so that there is an approximate conformity between them. The farther that we get away from first-hands, toward and to the consumer, the less there is of this knowledge, and the greater the opportunity for exacting a price one or more grades higher than the quality of the article justifies. It thus happens that the dealer is in a position, if he choose, to purchase a low-grade article at its correct price, and to sell it at a higher one to an uninformed merchant or consumer.

Of course the margin of profit is then greater by dealing in low-grade articles than in the better ones, but it is often claimed that none will care to engage in such practices, and that dealers are so honest that we need not fear misrepresentation of the grade or price of merchandise. This claim, I think, it is hardly worth while to discuss. It may safely be left to the judgment of any one who has had his business eye-teeth cut. He who has not yet submitted to such operations may be

confidently expected to undergo them if he assumes an attitude of blind trust in his business.

THE NECESSITY FOR REGULATION.

A number of incidents illustrative of the truth in regard to this matter occur to me as I write. I once traveled on a steamer that carried thirty-five hundred tons of licorice root. If the owner could have sold that cargo at the price of a grade one-half cent higher than its quality justified, he would have netted \$35,000 by the act. One of my friends who manufactures licorice has filled in a deep swamp in Jersey City, making a full-sized city lot and the four streets surrounding it into good, high, dry land, *with the earth removed from his licorice root!* Imagine the total weight of this material and remember that it was all paid for at the price of licorice root! I have seen a lot of many tons of nuxvomica seeds which had been rolled in clay until they bore a coating which probably increased their weight by at least 50 per cent. I have often seen buchu leaves to which had been added their own weight of stems, chopped as finely as coarse sand. Asafetida frequently contains from 30 to 50 per cent of chopped stones, and I have seen the same in cut dandelion root. Those who are acquainted with my papers before the American Pharmaceutical Association will recall many similar forms of fraud. Who will then say that a close scrutiny of commercial drugs by some one, at some point between producer and consumer, is not a strict necessity?

I have considered in these cases only acts of deliberate fraud, of a kind which must be considered exceptional in the drug trade, but what about the occurrence of similar results through carelessness or inattention? The collection of our native drugs is performed chiefly in very small lots, by the most ignorant, careless people, who trade their product at the village store. The merchant or his clerk, often equally ignorant, combine these small parcels to make up a shipment to the general agent. Mistakes of identity, foreign admixtures, the adherence of earth to roots, of stems to leaves, of wood to barks, and various other accidents, must be expected, and they call quite as strongly for correction as do the results of the fraudulent acts previously considered. What do such people know of alkaloidal standards? How fatuous to de-

pend upon them for regulation of the trade! What training, moreover, does the average pharmacist receive in such directions? In my teaching at the New York College of Pharmacy, I deem it one of my most important duties to instruct my students against every one of these pitfalls, but what percentage of the pharmacists of the United States can claim that they have had such training?

If such attempts are commonly made in the case of crude drugs, where detection is of the easiest, can we expect less in the case of manufactured articles? Is it or is it not human nature to take an easy advantage in a trade? Certainly such conduct is by no means universal, nor even the rule, but malefactors would quickly enough force most business down to their own level were no restrictions placed upon them. We have found the country flooded with adulterated and sub-standard powdered drugs, with adulterated chemicals, with tablets and capsules containing short-weight and substituted articles. I have found one large manufacturing house labeling its galenical preparations as containing the standard percentage of constituents, yet never assaying them to ascertain the actual character of the articles before affixing the label.

PREVALENCE OF FOOD SOPHISTICATION.

Turning to the second application of the law, what have we found true of the food-stuffs distributed by our grocer friends? You of Vermont know that no matter how honestly you might prepare your maple products, their composition, when they reach the table, would require the most expert of chemists to determine. It has even been reported that their adulteration at the point of production has not been altogether unknown. Almost every form of refuse has been regularly incorporated in the ground spices and condiments. Corn-cobs have been ground into meal and feed and, powdered and stained, have been sold as cayenne pepper. Great houses have even gone so far as to distribute starch under the name of gluten for deadly use by people suffering with diabetes.

Some years ago the board of trade of one of our large cities arranged a dinner at which not one of the articles served was to be genuine. The beef was horse-flesh, the lard made of cottonseed oil, the butter was oleomargarine, the olive oil was from Indian corn,

the syrup was glucose, the coffee made of roasted old shoe leather, the whisky was one of the vile concoctions which have been legalized during the present administration, and the wines were based upon vinegar. One of the rules was that everything served must have been obtained through the regular channels of trade.

From my personal knowledge, I can say that many highly profitable lines of trade in exactly such products as those mentioned, and even in the manufacture of articles to be used as adulterants, were destroyed by the enforcement of this law.

Surely we may assume that no intelligent and disinterested person will longer deny the importance of some form of regulation of the collection, manufacture, and distribution of foods and drugs to the consumer.

CAN THE BUYER PROTECT HIMSELF?

Within the month, I have had a long letter from one of our large food distributing houses saying that it is wrong for such regulation to be undertaken by the government; that if his dealers in other articles cheat him, he is fully capable of taking care of the situation, and that the government should leave each individual to protect himself. It therefore becomes necessary for us to consider how this theory would work out in the trade in drugs and medicines.

We must consider the producer, one or more distributors, and the consumer. The collector of a natural product cannot of course control its quality, except by its selection or its preparation, which latter really borders upon manufacture, but he may dispose of it under false pretenses as to its quality. In the case of a potent drug, which is properly required to attain a specified standard, the detection of such a misrepresentation may be very difficult, requiring a skilled and trained operator. The large purchaser may reasonably be expected to possess this ability or to employ some one who does, and it may also be expected, in view of the large amounts that he handles, that he will find it profitable to make the necessary examination. The dealers at second-hand, among whom he will divide his original purchase, are obviously less likely to possess the required ability and facilities, and the expense involved imposes a relatively greater tax upon them, in exact

proportion to the reduction in the amount of business that each represents.

When we reach the retail pharmacists, the original lot may be divided among hundreds or even thousands of individuals. The probability that any particular one of them will possess the ability and facilities for applying the necessary tests becomes very much less than in the case of the original purchaser. Furthermore, did they all possess it, the necessity for the performance, repeated these hundreds or thousands of times, represents a very serious economic waste.

When we come to the ultimate consumer, that is, the patient, all these difficulties and objections become enormously multiplied. The percentage of these who are competent is infinitesimal. The large majority are too ignorant to realize the necessity of taking any action whatever. For this reason it is often said that they ought to suffer the penalty, but it must be remembered that the lives and health of these people is an important community asset, and that principles of political economy require us to look after them, even though they do not care at all for their own interests. If they did realize their needs, and if government failed to care for them, they might organize some private coöperative system, but failing this, a far better arrangement of government coöperation has been wisely resorted to, with highly beneficent results already manifest.

If we have found that no intelligent and disinterested person can sincerely claim that regulation is unnecessary, it seems equally clear that none can doubt the desirability of placing this regulation under government control. If there are any such it would seem paradoxical to find them among retail pharmacists, the very class upon whom must fall the ultimate responsibility for the neglect of proper regulation, or the enormous expense of labor in accomplishing it through multiplied individual action.

WHY SUCH APATHY?

But we must go a step farther and seek an explanation for the amazing apathy which exists regarding the maintenance and enforcement of this law. Its importance is so great and its benefits so mathematically demonstrable that it would seem as though every medical and pharmaceutical organization, every church

society, every grange and men's and women's club throughout the land would not merely indorse it and then leave it to its fate, but would appoint a committee whose special business it should be to keep track of its workings and report regularly concerning them. If there ever was a people's law which should be jealously guarded and fostered, it is the Food and Drugs Act.

Were this course to be taken, a number of astonishing facts would soon become generally apparent to our people. They would find in the first place that no matter how thoroughly the law might be revised and its imperfections corrected, by far the greater portion of its possible benefits for them must be lost unless the State and the town coöperated with the Federal government. To put it into concrete form, it may be said that unless the State of Vermont and the city of Burlington shall charge some local body with the responsibility of seeing that the benefits contemplated by the Federal Food and Drugs Act are secured to their people, under corresponding local laws, they are quite likely to fail to secure them.

They will find in the second place that if this Federal Law and its administration are not faithfully guarded and supported by them, it is quite likely to fall into desuetude or even to be repealed altogether. Be not deceived by the praise of mouth service that is accorded this law in many directions where the most firm determination to destroy it exists, and where active operations to that end are continuously engaged in. Inquire as to the real attitude of officials toward this law and as to whether they have financial interests in its abeyance. Inquire as to the position of Dr. Harvey W. Wiley and the conditions under which he is performing his difficult and painful duties. Inquire as to who are his enemies and why they are so. Investigate the attitude of some representatives of the daily press toward the enforcement of this law and unearth the influences which determine it. When you have done this, you will conclude that there is reason enough for vigilance and aggressive activity in promoting this important cause.

PROTECTION NEEDED ALSO IN OTHER LINES.

There is another subject, closely related to the administration of the food and drugs act,

and its pursuit depending largely upon the success attained in the latter, which is of far greater importance. In my opening remarks I said that upon the more general recognition of the principles underlying this law and upon the extension of legislation based thereon, depends in great measure the health and happiness of our people and the success of our government. If it is true that we should take community action in securing pure foods and drugs because the result is important and cannot successfully be secured by individual action, then it follows that the community ought to take similar action in other similar cases.

Think for a moment what this means. Let us take the one case of silk goods, their great variety, their numerous grades, the character of the coloring matters entering into them, and the variety and ingenuity of the methods of adulterating them, and we shall see that microscopical and chemical examinations requiring considerable knowledge and skill are required to purchase them with safety, unless we depend upon the reputation of the dealer, for which he is going to charge a handsome addition to the purchase price. Apply the same reasoning to the subject of jewelry, of which not one person in a hundred possesses enough knowledge to enable him to purchase with safety.

The same thing is true of rubber goods, of

clothing, especially of leather goods, and in fact of almost everything included among the necessities of life. Every pharmacist knows how many pitfalls there are in the trade of paints and oils. Reflect that the methods of adulterating and deceiving in all of these cases have received the most studious attention from experts who have spent their entire lives in the business, and that an equally expert knowledge is necessary to detect them. Then tell me what possibility there is that even one man can be found, among the most learned and intelligent in this entire country, who will possess such an expert knowledge in relation to all of the numerous lines of goods to be found in the modern household!

A PROPHECY.

I believe the time will come when the intelligence of the community will make clear the absolute inconsistency and folly of expecting every ignorant person to be capable of protecting himself in the purchase of such articles, and when it will establish legal regulations not only concerning their sale but concerning the enforcement of such regulations. Our food and drug laws are as yet experiments, and if we can but succeed in securing through them the benefits that were contemplated in their enactment, we shall then be enabled to proceed gradually and conservatively in extending these benefits to other fields.

A DISCUSSION ON THE LIQUOR QUESTION.

Verbatim Report of Remarks Made by Several Druggists at Two Meetings of State Pharmaceutical Associations—The Sentiment Strong Against the Illegitimate Sale of Intoxicants by the Pharmacist.

At the 1910 annual meeting of the West Virginia Pharmaceutical Association there was a very suggestive discussion on the druggist's relation to the liquor question. We are printing the remarks of the several speakers verbatim:

President W. W. Irwin, of Wheeling: We shall be glad to hear from Mr. Kreig on the liquor question.

Mr. Arch. Kreig, of Charleston: I did not prepare any paper, for I cannot write a paper, but I thought over a subject which was as-

signed me as to whether a druggist should be allowed any discrimination in the sale of spirituous liquors. It is a subject which appeals very strongly to me, inasmuch as people whom we know, and people who are good customers, and people who we know are going to use it right, apply to us to have a liquor prescription refilled. Also people who have no prescription apply to us because they are good customers.

The law gives us absolutely no discrimination in the matter, and says "you shall not sup-

ply spirituous liquors except upon a written prescription of a practicing physician in good standing, stating that such spirits are absolutely necessary for the person named in said prescription, and it is unlawful to make more than one sale on that prescription." If you supply intoxicating liquors in any other manner except under the conditions just named you are not only liable to a heavy fine and imprisonment, but you will be deprived of your license, may also be deprived of your certificate of registration, and you will not thereafter be permitted to be a registered pharmacist or to practice pharmacy in the State of West Virginia.

Now to convince you just how far-reaching the law is it is only necessary to refer you to the fact that yesterday the secretary of our board of pharmacy made a statement that he had made arrangements with 32 States for the exchange of certificates; if, therefore, a pharmacist is deprived of his certificate of registration he will not be permitted to practice pharmacy at all in the State of West Virginia, nor in any of the other 32 States, without passing the examination required for registration; and then it is a question whether any of these States would register a man whose registration had been revoked in his native State. That brings us to the point: Do we want to exercise any discrimination? Is it best for us to exercise any discrimination in this matter? I think not. I want to say that almost invariably our friends whom we consider our best friends often prove to be, in our efforts to uphold and obey the laws, *our worst enemies*, and you know this should not be true. Any man who asks me to incriminate myself should not be looked upon as a friend, but as an enemy, and the sooner we sever ourselves from such friendly (?) alliances and come out boldly and state distinctly where we stand, the better for us all!

Can we afford for the sake of friends, or for the sake of intended or proposed friendships, to suffer the sweeping penalties which the laws impose?

Now regarding the benefits of these laws. Personally, I believe the laws are right. I also want to place myself on record as saying that I believe the laws are best for every pharmacist—both for the pharmacist who has a sincere desire to do right and obey them, and also for the pharmacist who would be dis-

posed to place a liberal construction upon them, and discriminate in favor of his friends. The law places a pharmacist in such a position that he can say "No" with good grace; and he can say, "This is the law and I cannot violate it."

In Charleston we had the law printed and we circulated copies of it among our people calling their attention to its sweeping penalties. To those who still insisted we said that we could not afford to incriminate ourselves for the sake of a few dollars; for with such people dollars and friendship go hand in hand, and I hope no member of this association would be willing to sacrifice his professional honor for either dollars or friendship.

Another thing; I believe the time is past when whisky and intoxicating liquors will occupy a place of any great importance in the *materia medica*. I believe there is and always will be something that will take the place of whisky in sickness. We can all recall numerous cases of friends who are dear to us, to whom whisky had been given in case of sickness with results that have been very disappointing not only to ourselves but to the physicians, and there is no doubt in my mind that if the sale were absolutely prohibited we would be far better off as a profession and the people would be far better off as people. I would favor absolute prohibition. (Applause.)

I would favor it first as a benefit to the people, because this is very important, and secondly as a benefit to the physicians, and lastly as a benefit to the profession of pharmacy in general. To us who are pharmacists this is of paramount importance, for we should regard the upbuilding and the uplifting and the honor of our profession next to our own honor! (Hearty applause.)

Mr. Geo. W. Keller, of Huntington: I would just like to say that I heartily indorse what Mr. Kreis has said, and I would go just a little further in regard to what we should do so far as the selling of whisky in a drug store is concerned. In the first place I will relate the experience I have had in a little town where I was manager of a drug business for four years. I found two drug stores in the town on my arrival, and soon discovered that both had the reputation of selling whisky. In fact, they were almost as bad as saloons. I will add, too, that in my entire experience I had myself never known what it was to dis-

pense even the smallest amount of whisky in a drug store.

As soon as I took charge of the place I immediately put forth every effort to eliminate whisky entirely. While this required some little time we did eventually succeed and did not have an ounce of whisky in our store. In the course of a few months two of the physicians requested us to keep a small amount of whisky in stock. We complied with this request and did keep just enough to meet their demands. This however was so small that it did not even enter as a factor in the business one way or the other. The year previous to my taking charge the sales showed a total of about \$10,000, a good portion of this business being obtained through the sale of whisky. At the end of four years from that time we were doing a total business of about \$16,000 with practically no whisky! This certainly shows that whisky is not in the least necessary in order for a man to remain in the retail drug business, and I am only relating this experience with the hope that any one who may be so situated as to think that he is compelled to sell whisky in order to remain in business will be convinced of his error.

I know it is rare to find a pharmacist who starts in the retail trade with the avowed intention of making the sale of whisky his main business. As Mr. Kreig has stated, he is led into his first sale by the entreaties of his best (?) friend. Again and again this best (?) friend prevails on the good-natured pharmacist to accommodate him until finally his conscience becomes seared. Finding the money coming so easy, he soon yields to the temptation of making the sale of whisky an important feature of his business, thus becoming liable to trial in court and the deplorable results that may follow, and also having disgraced his professional standing.

I will add also that I am not a prohibitionist. I do believe in the legitimate sale of whisky so long as it is made and sold from the place that pays a license and is known as a saloon. We look upon the pharmacist as having engaged in one of the best professions, but when he stoops to the illegitimate sale of whisky we cannot have the same regard for that man. I am in favor of our State association placing a resolution on record that we are absolutely opposed to even permitting

whisky to be carried as a portion of a drug-store stock.

Mr. Walter E. Dittmeyer, of Harpers Ferry: I heartily agree with what has been said by the preceding two gentlemen, but I may add that it is not only liquor that is sold unlawfully but other preparations such as Jamaica ginger, compound tincture of cinchona, and drugs of like nature, and I believe that if possible the sale of Jamaica ginger should be restricted to, say, one ounce at a time. I know from experience at home that there are fellows running around all day Sunday hunting this class of stimulants, but as we always refuse to supply them it is a pleasure to me to see them walk up to the fountain and drink soda water and phosphates instead.

[In addition to the foregoing expressions of opinion at the West Virginia meeting, it may be interesting to quote the remarks contained in the address of the president of the Vermont Pharmaceutical Association:]

A. L. Cheney, of Morrisville, Vt.: This is the most important problem before the drug trade to-day. Something heroic and systematic must be done if great and lasting harm to the welfare and dignity of pharmacy is to be avoided.

The tide of temperance reform has swept onward during the last year and everywhere the forces are lined up.

During the year the reputation of pharmacy has been dragged in the mire to a degree which sickens the heart of every earnest lover of the profession. Druggists have been prosecuted in almost all the "dry" sections of our country for selling liquor illegally.

It is high time for us to wake up and look this gigantic evil squarely in the eye and take the necessary steps to acquaint the public with our position on this question. Our position must be taken in a decisive manner, and I believe we must come out squarely against the liquor business and absolutely refuse to handle it in any manner whatsoever.

And now, Brother Druggists, here at this meeting, it is straight up to us individually, as never before. Now and here is our opportunity to place ourselves on record, and set ourselves forever right in the eyes of our beloved State.

This coming fall our legislature meets again, and something is going to be done with

this liquor question. Would it not be well for the druggists of this State to come out squarely against having anything to do with it? If there are any druggists in our State who cannot conduct a drug store without selling liquor, let them get out of the drug business,

but let's not have it said that any of us is conducting a drug store for the purpose of selling liquor.

If the public must have some place where it can purchase liquor, let it furnish that place, but do not have that place the drug store!

FOUR DRUGGISTS DISCUSS WINDOW TRIMS.

All Deem Them of Real Value to the Business—They Give Their Views on the Essentials of an Effective Display—Several Lines are Mentioned as Being Especially Adapted to the Purpose—How Long an Exhibit Should Last, and Other Points of Interest.

LOREN D. LARKIN, GLENS FALLS, N. Y.

We allow our displays to remain two weeks. Having two windows we change one each week, usually on Thursday. We clean both windows each week; so we have fresh, clean windows for Saturday.

We display all kinds of goods usually carried by a drug store except fancy articles in delicate colors which are apt to fade in a strong light.

In warm weather we keep the flies out of the windows by means of netting; so we have no trouble with goods becoming fly-specked and disfigured.

LINKING WINDOW TRIMS WITH ADVERTISING.

We are using M. P. Gould Co.'s advertising, "The Monthly Pharmacist," and are careful to arrange a display of goods advertised in the "Pharmacist" about the time the papers are distributed. If we are advertising anything special in the newspaper, we always have a window display to go with it.

The essential characteristics of a good trim are, first, clean glass, then clean paper, cheese-cloth, or whatever is used to cover the bottom of the window. We use figured crêpe paper entirely for our displays, for it is inexpensive, and being made in so many colors and figures, allows a good variety to the trims.

One of the main essentials of a good trim is to build it up so as to catch the eye of the passer-by, for that is the object of the trim. So many make the mistake of laying a display flat on the floor, and it does not attract the eye. Another essential is not to overcrowd the trim. We are careful to display only one

class of goods at a time and not to confuse the eye by a profusion. The most effective displays are often very simple, and sometimes very few articles are used.

Window displays certainly do pay as we have proven time and time again. Once we sold a gross of a certain kind of stomach tablet with which a little night lamp was given away. The twelve dozen went in a little over four days, a sale accomplished almost entirely by the display. At another time six dozen boxes of tablets with which a cuckoo clock was given away were sold in two and a half days by the same means.

In a good many instances where a display has not seemed to be very successful in direct results, the influence of the trim has been felt for weeks after the trim was taken out.

J. EARL TAYLOR, PH.G., GRIDLEY, ILL.

In most localities where my lot has been cast as a clerk, the ideas along "cleaning and trimming" the window were in a measure limited to the suggestion that comes from the one word "Friday." Friday seemed to be the day for a general cleaning up and arranging of the window display. It seemed to be set aside as the *one day only* for that work. I presume the idea of having a "set" day was that the business was more pressing on Saturdays, and that it was necessary to have things brighter and more attractive for the larger crowds of Saturday shoppers.

In a way, a set day is a good thing; but in the last few years I have taken an altogether different view of the matter. If I

trimmed my windows once a week, I presume I should adhere more strictly to the Friday idea because it has undoubtedly a strong feature. But for a long time past I have given more consideration to "conditions" than I have to "set days." The reasons are these: The first point in our window must be cleanliness; if you cannot have that you had better, as the saying goes, let the tail go with the hide, and do nothing. I believe one of the most disgusting things is a dirty window. If you don't keep the visible window clean you cannot expect your patrons to suppose that the invisible is clean—your work bench, your utensils, etc. Is it not true? Coming back to my first point, the condition of cleanliness is my chief factor. Should I have a trim in the window and it requires a change to be kept in good order, then it is changed.

Another thing, I believe in considering timeliness in the trim, special features, etc., including seasonable trims, special town functions, show days, athletic days and all conditions that give the druggist an opportunity to use the window to financial advantage. Many times our windows are changed simply to assist a home benefit, without any regard to the money returns whatsoever, simply to contribute to the cause. There are things, of course, that money cannot buy, and one of them is unselfishness to an honorable cause; so right here let me say—don't always pay attention to the direct returns on every window that you construct.

WHAT KIND OF GOODS TO DISPLAY.

The class of goods that we show in our trims are, for the most part, as nearly as possible, seasonable articles; but often one cannot show these because of the deterioration they undergo from the dust, sunlight, flies, etc. I enjoy working with box stationery, perfumes, etc., combs, brushes, tooth-brushes and toilet articles, but one must necessarily exercise extreme care because of the loss in spoiled goods. The summer months offer excellent opportunities for displays, but they are destructive to the stock in many cases. When it is hard to put in a trim on this account, I look to featuring articles that can either be cleaned without injury or that suffer but little from exposure. Feature pocketbooks, paper napkins, magazines, stock preparations, paints, fly preparations, insect powders, fruit preservatives, etc.

One thing we always keep in mind is to feature articles that yield a profit—not just the first thing that comes along—for the profits must defray the expenses.

Preparations of our own we "boost" through the medium of our silent salesman. We show goods of manufacturers, too, if they yield a living profit and the houses assist us, by free electrotypes, newspaper locals, window cards, cut-outs and easel displays. We try to work to a mutual advantage in this class of merchandise. If the manufacturer will not help, then we have "cramps" too; that's fair, isn't it?

We always connect our window displays with newspaper announcements on profit-payers and seasonable stuff. On our general trims we don't always use the assistance of printer's ink, but confine it more to specials, etc. For instance, there is the Kreso Dip made by Parke, Davis & Co. We have used both window and newspaper to exploit this product. To cite another instance: Hess & Clark stock; still another, Christmas goods; and, at the present time, our display of valentines. I could name many many other specific instances that have been winners, could I but call them to mind.

THE ESSENTIAL THINGS.

In my opinion the essential characteristics of a good window trim are these:

1. Cleanliness. This I have already mentioned.

2. The two features necessary to attract attention: the far and near perspective. The former depends upon the object, on attractive features that are large enough and important enough to draw the attention of the observer across the street. The near effect is intended to clinch a sale when the observer realizes the importance of the suggestions shown.

3. The price card. A neat, attractive trim is lame unless, after showing the strong features in the goods displayed, the price appears in conjunction with the merchandise.

4. The strongest characteristic I can think of, as an only feature outside of cleanliness and price cards, would be the mechanical effects. Nothing so attracts people as "motion" trims, and wherever I can I am using them.

When the above four characteristics are embodied in a window trim there simply must be an increase in your business!

DISPLAYS PAY.

Do window displays pay? How can anybody gainsay it? I have heard of men who in calculating the value of a window set off against the sales from the window the rent of the floor space which it occupies. To the average man that is all bosh. Why? Simply because your direct sales are *not* your criterion! They are *not* your actual sales. They are your direct sales, but how about your indirect sales? It would be next to impossible to figure the asset that your trim is to your business if handled judiciously. Here are a few specific instances of window displays that paid; they were written up in the BULLETIN as follows:

Rubber Goods, BULLETIN OF PHARMACY, January issue, 1911.

Stock Dip Display, BULLETIN OF PHARMACY, October issue, 1909.

Our own Cold Cure, BULLETIN OF PHARMACY, March issue, 1909.

Dead Stock Article, BULLETIN OF PHARMACY, August issue, 1910.

Euthymol Display, BULLETIN OF PHARMACY, October issue, 1910.

Christmas trim 1910 was a decided success, which I shall try and describe in a separate article before next holiday time. We could name a good number, had we kept record, that have paid us well for our efforts.

In recapitulating let me say that people judge a store by the windows to a large degree. The best thing to do is to put forth every effort to better your window conditions. We know it pays because we have proven it.

**P. I. MINTON, WITH L. W. RANDOLPH,
PLAINFIELD, N. J.**

We make it a rule to wash and trim our windows every Friday lest they should become dirty or soiled from storm or other cause. We always have them cleaned and retrim them.

We *never* put the same trim in a window twice; but having two fine display windows, we sometimes reverse and rearrange them.

GOODS DISPLAYED.

We generally display our own preparations and those for which we are sole agents, with the exception of baby foods, surgical goods, soaps, toilet articles, and a few well-known preparations, as Gude's Pepto-mangan, for instance. About twice a year we put in a beauti-

ful display of fresh fruits, advertising our soda drinks of pure fruit syrups. We also have appropriate displays for all holidays.

We do no newspaper advertising.

It has been my experience that a good window trim is based upon the following:

1. Neatness and harmony.
2. Not too much in windows—crowding spoils the effect.
3. Display one line of goods at a time.
4. Have neat signs placed on or around the goods displayed. We never plaster our show windows full of window strips.

A WINDOW DISPLAY OF CHOCOLATE ALMONDS.

By all means we *know* our window displays pay. For instance: Hallowe'en we put in a new display of Apollo Butter chocolate almonds in our window with a neat placard reading: "*Special Malinee candy, 15 cents a package.*" In the center of this trim we had a huge pumpkin with a Jack-o'-lantern face cut into it. We then covered the eyes, nose, and mouth with red tissue-paper. Inside we connected an electric bulb and put it into the pumpkin from the back, so that the cord could not be seen from the outside of the window. We also diffused our window lights with red tissue, thus making a very beautiful effect. This display attracted much attention, people even coming back across the street to see what we had displayed. It did not take very long to sell a gross of packages.

A BARREL OF ROCK CANDY.

Again: This winter we bought a barrel of rock candy (assorted red, white, and yellow). This we put into a window on the side and let the candy spread over the foreground, with a backing of half- and one-pound packages. Upon this we had a neat sign reading: "*Special, pure rock candy, 15 cents per lb.—1/2-lb. for 8 cents.*" We sold the barrel in about two weeks.

I could mention many other instances where we have sold goods through window displays.

M. NOLL, ATCHISON, KANSAS.

We change our window trim once a week, Wednesday being the time selected. Our displays include such items as toilet articles, rubber goods, patent medicines, and seasonable merchandise. In trimming a window, we aim

at uniformity, harmony of color, and artistic effect in the grouping of goods.

We try to call attention to our window display in the local newspapers in connection with the ads. that we run at the same time.

I am a firm believer in good window displays. On more than one occasion we have found they produce results. We have sold as high as four to six dozen of a fifty-cent article that was practically unknown before. In a

town of 16,000 that is pretty good work for a week.

We photograph all our windows and file the pictures. They prove suggestive later when the window trimmer wants ideas. In the last eighteen months we won several first and second prizes in window trimming, which alone paid us well for our trouble. Last but not least is the general prominence given to a store by the windows.

THE DRUGGIST AND HIS PROFITS.*

How One Firm of Pharmacists Deceived Themselves about Their Earnings—The Importance of Knowing the Actual Facts about One's Business so that Conditions May be Bettered when Necessary.

By HARRY B. MASON.

There is no doubt in my mind that the profits of the average druggist are not what they ought to be. The professional joke-writer who assumes druggists and plumbers to be modern hold-up artists, and who believes that their only superior is the Standard Oil Co., ought to revise his information and bring it up to date. Notwithstanding his occasional use of the same old sophistry, I stand on record as declaring that the pharmacists of the United States ought to make more money.

A TYPICAL CASE.

Now just to make clear what my contention is, I want to comment with some little detail on the case of a Southern firm of druggists—just one case out of scores that I have been made familiar with during the last few years. This firm comprised two partners. After they had been in business a year they submitted an annual statement to the drug journal with which I am connected. They did a business of \$22,744.57, and all through the year they thought they were making handsome profits. At the end of the year, however, after they had taken inventory, and made calculations as best they knew how, things did not show up quite as they had expected.

They selected us as father confessors and

made a clean breast of it. Why hadn't they made more money? They boasted that they handled a good line of sundries and realized an advance of 100 per cent on the cost of nearly everything. They had enjoyed a good holiday trade and marked everything at 100 per cent. They had filled 5629 original prescriptions and refilled about one-quarter as many more, making a total of nearly 7000 prescriptions altogether. On this prescription business the profit was 425 per cent based on cost! Other facts like these they told us about their profits, and they remarked that they did not believe there was a store in the State getting better prices than they were able to obtain.

Why, then, weren't they able to produce more filthy lucre at the end of the year when the business was figured up?

We examined their statement with some care, and we arrived at the inevitable conclusion that our Southern friends were not making anything like such profits as they fancied. This information was a startling surprise to them, but it was a fact which could not be escaped. We discovered that the total gross profits of the year amounted to \$7083.35. Dividing these profits by the sales, we found a percentage of gross profit of only 31.1! The expenses were 24.7 per cent, and thus a net profit was realized of less than 7 per cent! This is too small for *any* business, let alone a

*Read before the Michigan State Pharmaceutical Association at Battle Creek in June.

trade conducted where such good prices are obtainable as in this case.

DECEIVED REGARDING THEIR PROFITS.

These people thought they were making large profits on all their goods, but by their own figures we convinced them that, on the contrary, they were only realizing average returns of 31 per cent based on the sales, which means 45 per cent based on cost figures. They ought to have made 40 per cent on the sale figures, or $66 \frac{2}{3}$ on the cost. They talked about getting 100 per cent advance on a good many things and something better than 400 per cent on prescriptions, and how these profits were pulled down to so low a *general* average was beyond our ability to determine, not being in possession of the detailed facts of the business in all of its aspects. A large number of things, like patent medicines, for instance, must have been sold at a very low margin, or even at a loss, when consideration was taken of the cost of doing business.

The real result was that each of the two partners got about \$1200 in net profits, which, added to a salary of \$1000, made his total earnings \$2200. You will all agree, I am sure, that this was certainly an insufficient income from a business of such a size and character, selling practically \$23,000 worth of goods a year, and located in a place where excellent prices were obtainable. It is still further to be remembered, too, that nothing had been written off for bad accounts or depreciation in stock and fixtures, and that if these things had been taken into consideration the yield from the business would have been still further reduced.

The plight in which this firm found itself is distressingly similar to what hundreds or perhaps thousands of pharmacists would discover if they were only equally faithful in keeping tab on the figures. We have found this condition of things over and over again in examining the annual statements of druggists. Many a man is making far less in the drug business than he thinks he is. He reasons that because certain things like prescriptions yield him a large profit, he is doing pretty well on the whole. As a matter of fact, many articles like patent medicines are frequently sold at a very small profit, and perhaps even at a loss, when the percentage expense of doing business is taken into account. The more unprofitable

trade of this sort a druggist does, the more his *average* gross profit is pulled down to a surprising and embarrassing degree. I have often pointed out, for instance, that cigars, candy, and soda do not yield anything like the profit which most druggists believe, and that a careful accounting in these three departments ought to be conducted.

WHAT OUGHT TO BE MADE ON PRESCRIPTIONS.

I have referred to prescriptions, and I have spoken of the handsome profits presumably realized on them by this firm of Southern druggists. But I want to say now that although the prescription department is supposed to be the star profit maker for the druggist, it does not yield the returns that it ought to. Most druggists really haven't got nerve enough to charge good prices for their professional services. Many of them, too, are afraid that when a prescription is refilled it will be carried down the street and a lower price given on it by a competitor. We are always so fearful of what the other fellow is going to do!

Two or three years ago a druggist out in Arkansas submitted the following prescription to us and asked us to give a price on it:

Potassium iodide (Merck's).....	1½ ounces.
Fluidextract of sarsaparilla (P.	
D. & Co.).....	2 ounces.
Fluidextract of burdock-root	
(P. D. & Co.).....	1 ounce.
Simple syrup	2 ounces.
Water, enough to make.....	8 ounces.

Mix and direct one teaspoonful to be taken after each meal.

Instead of ourselves estimating what ought to be charged for this mixture we published it and asked our readers for their opinions. There were four responses. Two men suggested \$1.50; one declared that \$1.35 would be his charge; and the fourth man mentioned a price of \$1.00. In other cases of the same nature we have found the differences to be even greater, and after many years of observation I have come to the conclusion that the druggist is afraid to charge what he ought to get for his prescription services.

BIG DRUGGISTS GET GOOD PRICES.

In the large cities there is often the fear that the price will be cut by the big downtown stores. On the contrary, however, I do

not think my statement can be challenged that the so-called cut-rate druggists get better prescription profits than the average man. George B. Evans in Philadelphia, who, as everybody knows, has five big stores doing an enormous business, has for years carried out the following policy of pricing prescriptions: an advance ranging between 50 and 100 per cent is realized on the cost of the supplies, and a dollar an hour is charged for the time of the dispenser. Some such rule as this is observed by nearly all of the large stores in the country, and frequently the rate of profit is even larger. These men know to a cent what it costs them to transact their business. They realize what profits must be yielded to make their capital and their time properly remunerative. As a result they do not hesitate to get better prices often than the rank and file of retailers—not only better prices for prescriptions but also for counter goods. If they cut at all it is on patents and other things with established selling figures where a reduction makes a strong impression on the public.

To illustrate again that the big fellows are not afraid to charge good prices, let me cite an incident of three or four years ago where three ounces of cream of tartar were purchased at retail by government inspectors in Canada, and where the price had ranged from 15 to 50 cents! Was it the large dealers who charged the 15-cent price? No! One wholesale house and one department store charged as much for a single ounce of the substance as most of the retailers got for the three ounces!

Every time you will find it the rule that the man who gets the best prices is the man who keeps careful business records; who knows to a cent what his percentage of expense and his percentage of profit are; and who realizes what he must do to come out right at the end of the year. The low-priced man is the one who doesn't know these things, and who fancies he is making a good deal more money than he actually is.

THE IMPORTANCE OF BUSINESS RECORDS.

Every retail druggist in the country ought to keep careful tab on his business. He ought to devise and follow faithfully a system of records showing his purchases, his expenses, and his sales. With these figures available, he can tell at the end of the year

just what his percentage of expense is and what it costs him to sell every dollar's worth of goods. He can also tell what his percentage of profit is, and he can be in position to understand whether or not he has been fooling himself all these years, and whether he is making as much money as he ought to make. These figures must of course be checked up invariably once a year by an annual inventory, for no merchant, druggist or otherwise, can with any accuracy keep business records unless they are corrected by inventory fluctuations. The whole thing falls to the ground without this support. In addition to this, I believe that every druggist ought also to follow the same method in detail with his leading departments like those devoted to soda, cigars and confectionery. You cannot know too much about your business!

THE SAVING FROM DISCOUNTING BILLS.

Closely related to this question of making adequate profits is the question of cash discounts. For if a dealer can cut down the cost of his goods he is certainly adding that much to what they yield him on sale. I fear that most druggists do not avail themselves of their cash discounts as they should. They do not seem to realize how much money they can save in this direction. To get at the facts approximately, I recently picked out seven pharmacists who I knew discounted all their bills, and I asked them what the economies amounted to. Here are the respective sums: \$150, \$186, \$301.26, \$600, \$600, \$1000, \$5000. These are the amounts of money which the seven druggists saved last year alone by taking advantage of their cash discounts! Isn't this a convincing object-lesson?

Many druggists excuse themselves on the ground that they haven't sufficient ready capital. Note what one of my seven correspondents had to say on this point. He had started in business many years ago with a strong determination to discount all bills. Finding himself in the early days without enough ready money, he went to the banks for accommodation. During the first ten years, when the business was yet rather small, and when consequently he needed to make as much as he possibly could, he saved a total of \$2646.26. In the meantime he had paid the banks for interest on borrowed money only \$92.50!

Can anything be more eloquent than these actual facts about one druggist doing an average business in an average town?

IT'S UP TO THE MAN HIMSELF.

I have just been looking over some figures collected by Bradstreet the last year. What do I find? This, that four-fifths of all the failures in business are due to the men themselves! Bradstreet classifies the causes very carefully into incompetence, inexperience, lack of capital, unwise granting of credits, neglect of business, personal extravagance, and so on *ad libitum*, but the important point is that

merchants can blame external conditions for only one failure out of five. The other four times are up to the man himself! What is the lesson to be drawn from this statement? It is this: that the average dealer doesn't know until it is too late what his business is actually doing for him, or failing to do; that he doesn't keep a careful record of the facts; that usually he thinks he is making a good deal more money than he actually is; and that, so far as the retail druggist is specifically concerned, he is not ordinarily making his store yield him the income which he ought to obtain from it.

A WINDOW DISPLAY OF DRUGS.

J. Leon Lascoff, of New York City, is a well-known pharmacist of the professional type, and now for a year or so has been a member of the New York State Board of Pharmacy. Mr. Lascoff places emphasis upon the really pharmaceutical element of his busi-

ness wherever possible, and we are showing a window display recently devised by him to exploit the sale of botanical drugs, and more particularly to call attention to his prescription business. Along the front of the window is to be seen a long line of drugs, exhibited in

ness wherever possible, and we are showing a window display recently devised by him to exploit the sale of botanical drugs, and more particularly to call attention to his prescription business. Along the front of the window is to be seen a long line of drugs, exhibited in

83d Street and Lexington Avenue, beginning with R No. 1." The location here mentioned was the one occupied by Mr. Lascoff for many years. His new store, which is near-by, is only a year or two old.

A pretty good record!

DRUG-STORE SKETCHES

ALGERNON DISCOURSES ON THE SUBJECT OF DRUG-STORE HUMOR.

BY CLEO C. LONG.

"I'm going to write a book," announced Algernon on a bright spring day. "Personal memmores, you know, entitled 'Foolish Questions Asked in a Drug Store.' This certainly is the place to hear 'em alright, alright."

"Now you're shoutin'," agreed the soda-fountain boy. "The fool ginks that come in here and ask me fool questions in just one day would fill the directory. A guy blew in yesterday, and sez he, kind o' kiddened me, you know: 'Son, what's good for a case of indyspepsia?'"

"Thinks I, 'If he's a kidder he can't catch me off the job,' so I sez: 'Well, a cucumber is always good for a case of indyspepsia, but we're out of 'em right now. I think a little ice cream soda with fresh shrimps would do the work for you all right,' sez I, as chipper as you please, and do you know that gazabo got as mad as a hornet, and it was only the fact that the boss was out of the store that saved my job."

"You may get canned for it yet," said Algernon soothingly. "He's liable to write to the old man about it. Take it from your Uncle Algy that it never pays to get funny with these witty customers. They give me the pip. Did you ever know of a single solitary individual who could buy moth balls without acting funny about it? What's so darn funny about a moth ball I'd like to know; and yet every soul that ever bought one'll say: 'I see the ball season's opened again; guess I'd better have a few,' or 'Did you ever attend a moth ball?' or 'Did you ever hear a moth bawl?' or 'Gimme a few of those big white pills,' or some such rot. Then you're supposed to let out a peal of merry laffter as if it was a brand-new crack. Gee, if any man, woman, or child ever comes to me and states in plain speech, 'I'd like to have a pound of moth balls,' the shock would probably land me in a padded cell!"

"Not a chance of it," asserted the soda-fountain boy. "They even come and ask me for moth-ball cocktails, you know. Some one does it every day. The sight of a moth ball

is very inspirin' to the funny fellers. They all have to take a crack at it."

"Yea, even so," assented Algernon. "But after all they are no worse than people buying bedbug poison. They don't like to mention it, you know. They look around till they see it somewhere and then say, easy and careless like, as if it was an afterthought, 'Oh, by the way, I believe I'll take a bottle of this!' as if it might, by some remote chance, come in handy some day—when there was unexpected company. And half the time they'll ask how to use it, as if they had never used it before, or even heard of it. Nine times out of ten they'll say, 'I never saw a bedbug in all my life; we never had one in the house, but I use this for roaches,' as if roaches was something to be proud of! Speakin' of roaches, did you see the large colored dame that came in for roach paste this morning?"

"Sure, she seemed to make a hit with you," said the soda boy. "You dashed out of the door after her and waved your hand and watched her out of sight. Got a date?"

"Cut it out," said Algernon sternly. "She's the Wilson's cook, but she neglected to tell me so. She asked for roach paste or rat paste or something that would 'kill off all the varmints on the place.' I brought out some paste, and she wanted to know if it was any better than that powder stuff she'd been using. 'The varmints jes' thrive an' git fat on that powder,' she said; 'I tried it on the rats in the stable and the roaches in the cellar and the ants in the kitchen, and they all jes' come 'roun' an' beg foh mo'."

"I assured her that the paste would certainly put them all out of business. 'Why, a rat will sicken at the very sight of this paste, smeared on a cracker,' I said, 'and yet there's a strange fascination about it that attracts him, and he won't be happy till he gets it. The first nibble and he's a dead varmint.' I also told her how one little smear of paste would lay low a whole army of roaches and put millions of ants on the blink if they even got a smell of it. So she said she'd take a box, and she started out 'of the door with it. 'Jes' charge it, mistuh,' she said."

"'Who is it for?'" I asked.

"'Foh de Lawd, I done tole you it's foh de varmints! D'you all think I'm gwine ter pizen my ole man—not but what he needs it!' and she got away with the goods, too! I found

out afterwards that she was the Wilson's cook."

At that moment a customer entered, a middle-aged man of genial aspect, who assumed a jocular manner and thus addressed himself to Algernon: "I'll tell you, young man," said he, "this weather makes us all feel like playing marbles, doesn't it? Just give me a dime's worth of those nice white boys there," indicating the jar of moth balls.

And Algernon smiled a sickly smile as he deftly weighed out the desired quantity.

DOLLAR IDEAS

AN INGENIOUS FUNNEL REST.

Ralph F. Boris, Sedalia, Mo.: The accompanying etching represents a good device for supporting a funnel above the liquid when filtering into a graduate. This is much

handier than the ordinary iron funnel stand with rings sliding up and down on a rod.

I use an Antiphlogistine can, 50-cent size, first cutting a hole through the bottom of it, about $\frac{3}{4}$ of an inch in diameter. Then I punch three small holes for tacks in the bottom around the large hole and tack this to a tough half-inch board, having a corresponding three-fourths-inch hole in the center. The board used is about 6 by 6 inches. This will support any ordinary funnel that may be used

with a graduate and will keep it in the correct position to prevent liquids from spilling or rising above the filter paper when the funnel happens to tip.

THE SIGN ON THE CLOCK.

Charles F. Moyer, Slatington, Pa.: To increase your sales of corn cure, or any other specialty, try this scheme: Attach a show card to the lower end of a clock as shown in the accompanying illustration. Then set the

timepiece in the window where the people passing by can see it. The sign will receive due attention. Every time one looks to see the hour, he must read the ad. The preparation mentioned receives a good boost and the sales increase considerably.

BOOSTING A SPECIALTY.

O. P. McPherson, Gloster, Miss.: Here is a scheme I just tried. There was a show in town, the admission being 10 to 25 cents. All the "kids" wanted to go; so to help the little fellows I called in three boys (the 15-cent size). "Bud," said I, to one of the boys, "do you want to go to the show?" "Yes, sir," he replied. "Me, too!" "Me, too!" chorused the other two in unison. "All right, boys, we shall all go. Take this bottle of McPherson's Celery Compound, sell it for \$1. Keep 15 cents to go to the show." In less than ten minutes I had out a dozen boys selling celery compound. All worked hard. Nine

boys sold their bottles; three failed, but we all went to the show. The celery compound cost me \$5.50, plus 15 cents a bottle for selling, making a total cost of \$6.85. I got \$9.

POURING OIL OUT OF A FLAT-TOP CAN.

J. Weis, St. Paul, Minn.: It is amusing to see dealers when pouring oils or other liquids out of a flat-top shipping can, spill much of the stuff because they do not know the proper way of doing it. How gratifying it is to note the surprised look on their faces when they are shown how to empty the container with-

out spilling any of the contents! The trick is simply to hold the can so that its pouring hole is at the *top*, as shown in the illustration. This will give the can all the air it needs and prevent gurgling and splashing.

A QUICK WAY OF REMOVING LABELS.

Hugh M. Reid, Chicago, Ill.: The quick removal of labels is often necessary in any pharmacy, as prescriptions are frequently received which call for an original bottle of some proprietary medicine and it becomes necessary to remove the manufacturer's label and substitute a prescription label. Again a container with a soiled label is returned and the old label must be removed quickly. Much valuable time will be saved if, instead of soaking the bottle or scraping the label off with a spatula or knife, one will use a bit of steel wool. An instant's rubbing removes the label. The same treatment will be found of value in removing stains from mortars, graduates, etc.

FOR WRITING THE PRESCRIPTION ON THE LABEL.

Paul L. McConomy, Philadelphia, Pa.: We have several physicians who always ask that the prescription be written on the label of the bottle. To copy it on an extra label means that the prescription bottle will have two labels—one for the regular directions, and the other for the prescription itself. This is rather unsightly, so I got up a label on which there would be room for the whole thing. Of course this is only for liquids. I may explain

PAUL L. MCCONOMY		
DRUGGIST		
S. W. cor. 20th and Callowhill Sts., PHILADELPHIA		
For _____		

_____ Dr. _____		
No. _____	Mo. _____	191 _____

that we have this type of label in two sizes—one for large mixtures and the other for smaller ones. They are convenient and neat. The larger of the two labels I use for any prescription containing over three ingredients, and the smaller one for those having three ingredients or less. [One of the two prescriptions is shown in the accompanying reproduction.—THE EDITORS.]

PREPARING BASHAM'S MIXTURE EASILY.

P. I. Minton, Plainfield, N. J.: We have a little framed card upon our prescription counter as follows:

	500.0 Cc.	250 Cc.
Ammonium carbonate.....	12.5	6.25
Acetic acid.....	280.0	140.0
Tincture of ferric chloride.....	20.0	10.0
Simple elixir.....	60.0	30.0
Glycerin	60.0	30.0
Aqua q s.....	500.0	250.0

This makes a strictly U. S. P. product and you always have the formula before you. Simply compound the mixture in the order given.

LETTERS

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

MORE ON THE TEN-HOUR DAY.

To the Editors:

Having read Mr. Burton L. Bennett's article on the ten-hour law in your May number, I would like to say a few words. I am not a clerk, but have been until the past year and am able to see both sides.

As to Mr. Bennett's argument about fixing hours, why can't his clerk open at 8 A.M. and work till 12 M.; return at 1 and work till 6 P.M.; and then return to work from 7 to 8 P.M.? On Sundays let the proprietor keep open a couple of hours in the forenoon.

As to the clerk putting in only 60 per cent of his time while the store is open, I say that is enough. If you are going to keep the store open from 9 to 12 o'clock at night, let the proprietor stay there himself a while and he will begin to think ten hours are enough. I am sure a drug clerk does not compare with a benchman, as Mr. Bennett says, in either hours or pay. A benchman receives from \$4.00 to \$5.00 a day for eight hours, and a drug clerk \$3.00 or \$3.50 for ten to fifteen hours. I know also that working at a prescription counter and waiting on people all day are hard work. I have been told by druggists who have labored on farms before coming into the drug business, that plowing was neither harder work nor more tiring.

Now as to the proprietor, he is in and out all day attending to details and sometimes is away on pleasure. He can take from one to two hours for meals with no apologies to any one. If there is any time for any one to read or chat with customers, it is usually enjoyed by the proprietor while the clerk does the work. If there is anything special going on, the proprietor usually goes and the clerk keeps shop.

I believe the proprietor should have some privileges, but I also believe in a clerk getting out of the store before everything in the entertainment line is over. F. A. MOREHEAD.

Watsonville, Cal.

To the Editors:

In the May issue of the BULLETIN OF PHARMACY, in the department of "Letters," I endeavored to call the attention of pharmacists generally to the so-called "Ten-hour drug-clerk bill," introduced in the present Connecticut legislature. It is quite possible there may be some interested in the fate of that measure.

The bill as introduced received rather favorable attention from the Labor Committee, to which it was referred for action, but after vigorous protests from pharmacists of the State it was amended by the committee, limiting the number of hours any prescription clerk might work to *seventy hours* in any one week, instead of *sixty hours* as first introduced.

The measure as thus amended promptly passed the Senate, but was defeated in the House of Representatives, due to the effort and hard work of a druggist, Mr. Howard N. Wilcox, a member of the legislature. So that, as the matter stands now, the measure is killed for the present at least.

Now the point I want to make is this, that with the great number of bills coming before the various State legislatures, many of them detrimental to the drug trade, pharmacists ought to take more interest in matters political, electing more of their profession to the State assemblies to look more carefully after their interests, and so block much of the undesirable legislation aimed in their direction.

Bristol, Conn.

BURTON L. BENNETT.

PREPARING A PALATABLE DRAUGHT OF CASTOR OIL.

To the Editors:

I have seen several formulas published in the various pharmaceutical journals for extemporaneously preparing castor oil in a palatable form. I've tried them all, but have found none so satisfactory as the old-style syrup of sarsaparilla, which I make in the regular way, excepting that I use 1½ ounces of concentrated malt extract to a quart of the syrup instead of tincture of soapbark, as is generally employed for producing the foam. The extract of malt is preferable to the tincture of soapbark because it is very palatable and is not an irritant to the stomach. A foam which lasts longer is also obtainable.

I generally put one ounce of this sarsaparilla

syrup in a 10- or 12-ounce glass, turn on the carbonic or Vichy till the glass is full of foam, and lastly pour in the desired quantity of castor oil. You can't taste the oil when thus prepared.

A. B. ROBERTIELLO.

New York.

DOESN'T BELIEVE IN FIVE-CENT SALES.

To the Editors:

Here are a few points which I think should be brought to the attention of the druggists of the United States. Kill off the five-cent trade and make ten-cent sales the lowest. Five-cent sales are as a rule profitless. Drill your clerks to say ten cents' worth instead of five cents' worth. Epsom salt, lead-water, lime-water, and a very few other things are the only ones that it pays to sell five cents' worth of. Five-cent sales of paregoric, tincture of iodine, Turlington's balsam, Bateman's drops, tincture of arnica, listerine, sweet spirit of nitre, spirit of camphor, aromatic spirit of ammonia, essential oils, tincture of valerian, essence of peppermint, Hoffman's anodyne, syrup of ipecac, and many other drugs are made at a direct loss.

In employing a careless or ignorant clerk you do business at a direct loss and then wonder why you do not make money. The laity is ever ready to send to the drug store and say, "Oh, just get me five cents' worth." The old-time proverb that the druggist makes big profits no longer applies. Look at the high prices on all drugs and medicines. The average druggist suffers from self-delusion and wonders why after he pays his bills and expenses he does not have more money. Cut out the five-cent sales! The sooner the druggists of the United States recognize the important fact that they do not pay, the better it will be for them.

JUNIUS PESTLE.

Camden, N. J.

A RATHER UNCANNY PRESCRIPTION WINDOW.

To the Editors:

Let me describe a trim that appeared in our window. It was arranged as follows:

First secure from a doctor friend a skeleton, the larger the better. Then cover the floor of the window with black crêpe paper. Cut up strips of red paper about 3 inches wide and make squares so as to have a red and black

effect. Then print some black cards, using white ink and give the name of some poison, its source, antidote, and dose. Place the card in a square and put poison in front of the card. Then run a small red ribbon from the card to the skeleton's hand.

In the next square use black ribbon, and so on, changing each time. I cut up the crêpe paper in half-inch strips and used them instead of silk ribbon. They work just as well. I also place cards in back of window referring to the prescription counter. I used six cards reading like this:

"We do not substitute."

"Prescriptions for the baby our specialty."

"You can trust us to fill your prescription exactly as the doctor orders."

"Four registered druggists to fill your prescriptions."

"Rogers', the prescription store of Astoria."

"Our prescription prices are as low as best quality will allow."

At night you can place an electric bulb in the skull and enhance the effect. We had a large crowd around our window all the time. The display remained ten days and brought many people into the store. They asked different questions and as a rule bought something.

EMIL A. SCHAEFER.

Astoria, Oregon.

"BEER SEED."

To the Editors:

Referring to an item in your query column of the June number of the BULLETIN OF PHARMACY concerning "Beer Seed," I may say that I have seen these "seed" in several parts of this State. The recipe for the beverage is about what you print, except that molasses is generally considered better for sweetening purposes than sugar. If you would like to have a sample of the seed, I shall take pleasure in sending you some. You may be able to classify them. I have never seen any one who could tell anything about them.

Danville, Va.

W. M. BRYDON.

To the Editors:

In my younger days I used to see people make a beverage of this kind from what was known as "California beer seed." I do not know the origin of this product, but I remember that it was passed around from one neighbor to another.

Recently I clipped from the *Kansas City Times* the following recipe:

Beer Seed.—Take sorghum syrup and sweetened warm water; keep in a warm place for twenty-four hours; pour off two-thirds of the mixture; fill up with sweetened water as before. Keep this up every day for three or four days and the seed is formed.

Whether this is the recipe W. R. M. is looking for, or the same one I was familiar with, I do not know. I am glad to give it for what it may be worth.

W. H. KEETON.

Little Rock, Ark.

TROUBLE IN THE TUMMY.

To the Editors:

fession may be praised for their penmanship. This letter came to us not long ago from a woman in trouble.

Brooklyn, N. Y. MEYER TUMAN, PH.G.

A READER TAKES ISSUE WITH US.

To the Editors:

I am an interested reader of your "Profits and Earnings" department and after reading your comments on a Michigan druggist's state-

ment in the June issue, took particular notice of your statement in which you say it is practically impossible to make a net profit of \$924 over and above a salary of \$1000 on a \$3000 stock.

Taking as a basis your statement in comments on "A Texas Business" in which you say it is possible to turn your capital over three times a year, I started to do a little figuring, with the following results:

$$\$3000 \times 3 = \$9000 \text{ yearly sales.}$$

Taking 40 per cent on the gross profits, which you said was a fair average in some of your previous comments, and 29 per cent as the expense, I get the following result:

$$\$9000 \text{ yearly sales.}$$

$$40 \text{ per cent} = \$3600 \text{ gross profit.}$$

$$29 \text{ per cent} = \$2610 \text{ expenses, including \$1000 salary.}$$

$$\$ 990 \text{ net profits.}$$

"WISCONSIN DRUGGIST."

CLEANING SILVERWARE QUICKLY.

To the Editors:

In regard to the inquiry of "J. J. D." in the Service Department of the June BULLETIN OF PHARMACY, concerning the use of metallic plates for cleaning silverware, it may not be amiss to mention the method used by Mrs. Clark. She puts the silver articles into a perfectly clean and bright aluminum dish, pours on enough water to cover them, adds one tablespoonful of Wright's Silver Cream, and boils for fifteen minutes. They are then wiped dry when cool enough to handle. By this method silver can be cleaned as quickly as it can be washed.

Rumford, Maine.

J. E. WESLEY CLARK.

THE DEATH BENEFIT ASSOCIATION IDEA.

To the Editors:

I have recently had a letter from a young woman in the East bearing upon a suggestion made by me some years ago in the columns of the BULLETIN OF PHARMACY. My idea was at that time to have a mutual death benefit association created something after the plan of the German Apothecaries' Society in New York. There I believe about 250 members belong, and each chips in a dollar at the death of a member, thus making a death benefit of \$250. Many a time this amount would be a

godsend to some poor druggist's widow for funeral expenses, and the idea that a man's colleagues would relieve the widow in such an emergency appeals to me. Why not take up the matter in the BULLETIN again?

SOME VERY INGENIOUS SPELLING.

To the Editors:

I am sending you an order which was received not long ago in the regular course of business by the Pecos Valley Drug Co. of Roswell, N. M. It may be of interest to your

*Quick are Toyalis
fare faint troubles*

readers, and I do not think that you will have any trouble in discovering that what was wanted was digitalis for heart trouble, although the ingenuity shown by the man in spelling was quite remarkable.

C. S. BASS.

DON'T BITE ON THIS!

To the Editors:

A salesman for an advertising concern is soliciting orders for photograph pillow tops to be used as premiums. You pay him \$5 and he gives you about \$1.50 worth of cards and samples. The cards are to have the amount of your customers' purchases punched on the margin. He also agrees to furnish you the photograph pillow tops at 45 cents each, but there are other firms who only charge 30 cents each. In addition this man agrees to do other things which, however, not being in the printed agreement, would not bind the principal if written in by the agent.

Christiansburg, Ohio.

JAMES H. MILLER.

To the Editors:

I consider the BULLETIN OF PHARMACY the leading pharmaceutical journal. It is a real achievement in strictly ethical pharmaceutical journalism, due to the editorial staff and chiefly Mr. Mason. The BULLETIN should be on the desk of every wide-awake druggist, as it contains valuable chapters on pharmacy, gives a résumé of things going on in the drug world, and has many commercial and business-getting ideas.

Chicago, Ill.

I want to say that really the BULLETIN OF PHARMACY seems to me the most interesting of any of those which are for the retailers, and your editorial pages as interesting as those I read anywhere in drug literature. It is a paper which every druggist who is progressive should take.

E. F. BILLINGS.

Boston, Mass.

* * *

To the Editors:

Having read nearly all the pharmaceutical journals of importance, I find the BULLETIN to be the only Real Article. When I see the postman drop it on the counter I know there is a treat in store for me.

Stapleton, S. I.

EMIL LINDEMANN.

Merced, Cal.

THE SODA FOUNTAIN.

SOME SODA HINTS.

BY JONAH F. RUPERT.

Thin glasses are much more pleasing to the soda palate than thick ones and curved glasses look better than straight ones. In glasses, the idea seems to be to please the fancies of the customer and at the same time to guard the money till. Consequently, the bell-shaped glasses have come into more general use. The bell top, when filled with foam, looks well to the customer, who thinks he is getting a big glass for his money, but the rather constricted bottoms supply a limited amount of product.

THE "HEAD."

Soda is not soda at all without the foam top, the "head." The head is that which pulls the nickels by its tempting appearance and is a test of the skill of the soda clerk. But people want more than foam. They appreciate a drink. When the palate is dry, a person wants something to wet it, especially if he pays for it. Therefore, I believe we should give a customer a reasonable amount of soda and only add the foam for appearance. If the glasses are thought to be too large, rather than fill them with foam, reduce the glass in size and give a liberal amount of soda, not forgetting the tempting "head."

As to holders, I recommend something thoroughly practical. Next to this specification, I would recommend a light holder. A practical holder, while of course serving the purpose intended, will wear well, and when the stack of holders comes down with a crash, as happens sometimes, they will be restored from the wreckage with the least damage done.

The necessity for calling a clerk's attention to cleanliness should be considered a warning of immediate discharge upon a second offense. Cleanliness about a public soda fountain is the foundation of the business, and any violation of rules of neatness is serious.

TABLES VS. COUNTER.

Some people like to rush in, get their drinks, and dash off again. These will prefer to stand or sit at the counter. Some of the genteel insist on sitting at the tables, and those who have enough time usually prefer the tables. I believe tables will usually increase business, as the "have another" will usually be more in evidence on a hot afternoon or evening when people of leisure habits gather around the tables in companies often up to six or more. For this reason and others, I would not recommend permanently fastening chairs and tables to the floor, although for a very busy fountain this arrangement saves time arranging the furniture during the busiest hours.

SUITING CUSTOMERS.

We must exercise the greatest care to give people exactly the drink they ordered, and if they want it prepared according to some particular whim or fancy we must attempt to please them, or at least give the

appearance of doing so. Under no circumstance try to force upon a customer a drink that was not ordered.

Should a drink not taste to the liking of the customer, or if he should remark that he wants it a little sweeter, or it is too sweet, we must politely at once insist on suiting his taste by adding more syrup or more water.

All inquiries must be patiently answered. An experienced soda clerk will glide about during a rush or among any circumstances and will keep everybody patient, entertained, and seated. It is an evidence of want of tact on the part of the clerk when a dainty or bashful customer wants to try everything at once, not knowing at all what to drink.

Of course, the patience of the soda clerk will be most painfully tried at times, but it must be remembered that patience is as much a part of his art as concocting the tempting nickel snatchers.

REGARDING FANCY DRINKS.

I never felt that the soda business is built and held on the specialties of the fountain. Rather, I believe the treatment of the customer, the quality of the drinks dispensed, popular prices, the general appearance and impression, will attract more nickels and dimes than any fancy name or drink ever did. Of course, a limited number of fancy drinks of merit may be added, just for variety. Usually, in such cases, the name seems to have more value in general connection than the drink, especially when the name is made to apply distinctly to the beverage. For instance, "Wintergreen Breezes" is applied to a soda of wintergreen flavor, even though very faint, made in a large glass with an immense head of foam that will stand. The drink must be imbibed through a straw, for no mouth is large enough to save the face from an application of foam in the case considered. This drink may be colored green with aqueous chlorophyll if desired.

Menu cards should be printed; but I believe the tendency to arrange them in book form, strung out to make an appearance, with little matters thrown in to make space, is a bad idea. I prefer to print all on one side of the card, thus saving both the time of the clerk and the customer and making the card much more easily comprehensible.

The drinks most usually called for should be arranged at the top of the card with prices in all instances. The fancy-name drinks can be put at the bottom of the card, so that they can be had by those who like to "try something new."

If a customer has fault to find with any drink, insist on taking the drink from him and supplying another. Every such complaint should be most carefully examined into. Usually the complaint will be found to be reasonable.

AS TO STRAWS.

The plan of placing a greater or less number of straws upon the table in a container is often complained against by the most careful. From a sanitary point of view it is most inexcusable. I think a better plan is to supply a straw with each drink, in the glass or without, usually in the glass. If the customer does not care for the straw he will not use it, or often this class of persons are those who "dash in and dash out

again," and they are not slow about saying "Please leave the stick out."

Incidentally, I will remark that the idea of putting a "stick" into the drink, as practiced at some fountains, and considered a clever ruse, is a reprehensible practice. The revenue officer has a habit of patronizing these places.

THE ICE CREAM.

Ice cream, of course, will also be required to come up to the first class in standard, as other articles entering into the business. With ice cream, the standard is not particularly one of fat content, but of freshness, the absence of the cheapening agents usually added, and rank flavors. Ice cream should not be too highly flavored and must be of the proper consistence when dispensed. Soft ice cream will ruin any fountain business. But the cream must not be too hard. Ice cream that can be chewed requires too much time to dig it from the tins, and is not desired by many customers.

As to the storing of ice cream, the entire virtue of the cold lies in the brine or melted water about the cans. Cream keeps at a proper consistence when the tins are immersed well into the brine with very little ice floating about in the water. I know, particularly, of an inexperienced man who dispensed his ice cream from the packers as supplied by the manufacturers and had arranged to allow the water to escape from the packers at once by removing the plug at the bottom. He stated that in spite of packing and repacking with a large amount of salt and ice, he could not keep his ice cream hard, and I know that he never learned the secret and finally gave up handling ice cream in disgust. It is a mistake to remove the melted water too rapidly or often. Rather an arrangement should be made by which the cans can be held down into the water and the liquid removed only when it rises so high as to cause fear of its flowing over the edge into the ice cream. Should this happen, the best way to undo the mischief is to remove the tin at once, pour off the salt water, add several affusions of pure water, and usually the cream will be found not the worse for the entire experience, except that it may be a bit soft on the top. The danger of the cans leaking must be closely guarded against.

PLAIN CREAM.

As to the use of plain sweet cream in plain soda, some dispensers are too free in using cream where it is contraindicated. Cream should not be added to acid drinks, such as strawberry, lemon, raspberry, etc., or drinks containing fruit acids, as the cream is curdled, and if not drunk at once the curd collects on the surface and the customer will think something is "wrong." Cream may be added to vanilla or chocolate with improvement.

PROFIT LEAKS AT THE SODA FOUNTAIN.

To so perfect construction that the awful "profit leaks" in the operation of a soda fountain might be avoided, has been the dream of the progressive manufacturer for the past ten years.

To place the soda fountain business upon a certain and definite basis of profit that could be measured as

accurately as would be possible in calculating the profits from the sale of a dozen bottles of castoria, or other patent medicines, has been the goal to which great manufacturers hoped to attain.

The fountain inventor and designer recognized that there were four elements of loss in the operation of the average machine that in the aggregate of a season's run were a tremendous charge on the net profits of operation, viz.:

1. Loss of volume in ice cream.
2. Loss through the daily ice bill.
3. Loss through overmeasure of syrup.
4. Loss through fermenting syrups and crushed fruits.

To explain these losses for fuller understanding:

Loss of Volume in Ice Cream.—2½ gallons of material when frozen in a brine freezer will make five gallons of ice cream. And so long as this ice cream is preserved in a perfect condition, it will dish out perfectly according to the measuring dipper used by the dispenser—12 to the quart; 16 to the quart; or, other measure employed. But the moment this ice cream becomes soft or mushy it loses from 42 to 50 per cent of its volume. The melting cream may be only around the walls of the can, but any operator may quickly discover that this apparently small meltage is sufficient to cut the number of measures to the quart in half, or nearly so. This item is the largest element of loss in any fountain. To prevent it means the cutting of the ice-cream bill anywhere from 20 to 33⅓ per cent. To build a fountain that would accomplish this result was the great ambition of certain manufacturers.

Loss Through the Daily Ice Bill.—The leaks in profits on this item would naturally be different in different fountains and with different operators. But be the daily loss small or much, in the year's run the constant drip-drip-drip of the ice-box had worn a great hole in the fountain profits, as the melted ice water found its way into the city sewer. To save this was a great achievement.

Loss Through Overmeasure of Syrup.—The natural tendency of all dispensers with a spigot syrup faucet or bottle, or an imperfect pump, is to put more syrup in the glass than really should be served. The season's aggregate losses from this feature of operation are always considerable. The progressive manufacturer thought to save this loss for the fountain owner.

Loss Through Fermenting Syrups and Crushed Fruits.—Every operator knows that the average fountain will not keep his syrups or crushed fruits cold enough to preserve them. To build a fountain that would insure sufficiently low temperature to guarantee thoroughly chilled syrups and fruits has proven no small difficulty.—E. R. THOMAS, in *The Show Globe*.

A COUPLE OF FORMULAS.

SPANISH LEMONADE.

The juice of ½ orange, the juice of ½ lemon, and 1½ tablespoonfuls of sugar, 1 scoop of crushed ice, and water to fill a large glass.

GRAPE-JUICE-ADE.

One ounce lemon syrup, 1 ounce grape juice in mineral glass; fill up with soda, stir well, and serve.

PRACTICAL PHARMACY

Dispensing Difficult Prescriptions.—

At a recent meeting of the Edinburgh Chemists' Assistants' and Apprentices' Association a symposium was held on dispensing problems and related matters. J. D. Watson communicated the following notes on pills and emulsions:

FERROUS CHLORIDE IN PILLS.

Ferri protochlor.....gr. ij.
Aloin.....gr. 1/12.

Ft. pilula. Mitte tales xij.

Batch No. 1 was massed with 1 grain of powdered tragacanth and 1 minim of simple syrup; for the second dozen pills 2 drops of mucilage of acacia was used to make the mass; while lot No. 3 was massed with anhydrous wool-fat, with the addition of 3 grains of powdered marshmallow. The three batches were rolled in licorice powder, lycopodium, and French chalk, respectively, and then placed in separate bottles and well corked. The first lot showed signs of softening after five days, but no change could be detected in the other two. A pill from each lot was then laid aside in a pill-box, and about five hours later No. 1 was like a drop of muddy water, while No. 2 was beginning to show a little dampness on the surface, but No. 3 was still unchanged. Two days later No. 2 had also collapsed, but No. 3 still retained its shape, though quite soft.

It was remarked that ferrous chloride, being very deliquescent, should, if kept in stock for some time, be carefully dried on a water-bath before using for pills.

If only a dozen pills are ordered at one time, either syrup with tragacanth or mucilage of acacia does perfectly well; in fact, mucilage makes the hardest pill. If a large quantity be ordered, anhydrous wool-fat with a little marshmallow is much to be preferred, although it does not make such a hard pill.

In the discussion one of the members said he had found wool-fat with 10 per cent of wax gave a good pill, and that the addition of marshmallow was liable to cause oxidation. He also showed a sample of ferrous chloride pills made with a benzol solution of Canada balsam as excipient which remained quite hard at the end of twenty-four hours when kept in an ordinary pill-box, but which dissolved in water at blood temperature, with occasional shaking, in half an hour.

The chairman said ferrous chloride pills massed with anhydrous wool-fat and varnished were perfectly good at the end of a year. He thought such pills should always be varnished.

A BALSAM OF PERU EMULSION.

Bals. Peruv.....3ij.
Syr. tolu.....3ss.
Tr. camph. co.....3iss.
Aquam ad.....3iv.

Sig.: A teaspoonful if the cough is troublesome.

No. 1.—Made by rubbing the balsam with an equal part of powdered gum acacia, adding 3 drachms of water to form a mucilage, then more water, and the syrup and tincture last of all.

No. 2.—Prepared by rubbing the balsam down with

an equal part of almond oil, and then adding 6 drachms of water, finally finishing off as above.

No. 3.—To a fresh mucilage of powdered gum acacia 2 drachms and water 3 drachms the balsam is added gradually, then more water, and lastly the syrup and tincture.

No. 2 gives a nice white emulsion, but the addition of a fixed oil seems quite unnecessary, as No. 3 is entirely satisfactory.

Other formulas discussed were:

Ferri arsenat.....gr. 1/12.
Potass. carb.....gr. ijss.
Ferri sulph.....gr. ijss.

Ft. pulv. Mitte tales xxiv.

Forty grains of dried ferrous sulphate was used as the equivalent of the 60 grains of ferrous sulphate crystals, the 20 grains of water of crystallization being used to dissolve the potassium carbonate, the two salts being rubbed together thoroughly. The ferrous arsenate is added and the whole set aside for ten minutes, when the mass becomes quite hard, but softens on working. Powdered tragacanth 4 grains is added and the mass rolled out. A great saving of time and labor is effected compared with rubbing up the crystal sulphate of iron and potassium carbonate.

Argenti nitratis.....3ij.
Aluminis.....3iv.
Aq. destill. ad.....3viij.

Solve.

Sig.: Add a tablespoonful to half a tumblerful of water and use as a gargle three or four times a day.

Silver sulphate is precipitated by interaction between the silver nitrate and alum. This precipitate dissolves when diluted with the amount of water directed, but it is such a heavy powder that it will be very difficult for the patient to get an equal quantity of the precipitate in each amount used. It is better to dissolve the salts in twice the quantity of water and direct two tablespoonfuls to be added to the required quantity of water.

Sodii bicarb.....3ij.
Bismuth salicylat.....3ij.
Sp. chloroformi.....3iss.
Infus. gentian. ad.....3viij.

Calculation shows that 1 drachm of sodium bicarbonate is sufficient to convert the 3 drachms of bismuth salicylate into oxycarbonate, and these amounts were heated together with the water to dispel the carbon dioxide, and then allowed to cool before adding the other ingredients. It is not permissible here to dispense bismuth carbonate, because if dispensed with the salicylate the sweet taste of sodium salicylate is quite predominant, and the patient would at once notice the difference.

An elderly gentleman was strolling in the East End when a woman rushed up to him.

"Oh, sir, will you please come at once? There's three brutes of men jumping on a poor organ-grinder."

"Is he a big organ-grinder?" queried the old gentleman, calmly.

"No, no, sir; quite a little man. Oh, come at once, or it will be too late!"

"I don't see why I should interfere," replied the old gentleman. "If he's a small man, the three of them don't need any help."—*Tit-Bits*.

BUSINESS HINTS

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

Some Neat Package Slips.—

H. W. Lahr of the Crescent Drug Store, Glasco, Kansas, employs a variety of counter slips in his business. They are mailed to customers along with circular letters and are also wrapped up in packages. Here is one of a distinctly literary character:

IN the spring when mother earth changes her celestial cloak of snowy white, studded with diamonds of crystal ice to a cloak of emerald green, brightened by sparkling drops that patter in the night, and her breath becomes redolent with the odor of sweet perfume and is mingled with the notes of the sweet voiced birds; and when every heart is the heart of truth and every deed the deed of love; then Palmer goes from hill to meadow, from mountain to valley, from ocean to ocean and sea to sea, and with his scientific hands receives from the beautiful cups of daffodil, the sweet pea, the lovely rose, the beautiful lily, from the fragrant clover and the spicy carnation their choicest odors, and with the skill of only him he places them in beautiful packages and distributes them to the world.

Yours truly,

NATURE, The Producer.
PALMER, The Distributor.

P. S. For sale at the Crescent Drug Store, Glasco, Kansas.

Another slip appeals to book lovers:

BOOKS

WE make a little study of books and authors. We buy the best done in the latest art of book bindery, so we have books that not only make beautiful gifts but make friends also.

One for any occasion.

Then if you wanted a book printed in clear type on best paper and bound in boards, it would be a joy to look over our collection.

Ask about the circulating library for 1911.

The Crescent Drug Store

GLASCO, KANSAS

OVER

Then there are one or two on vanilla and spices:

PURE VANILLA—that is all

NOTHING wonderful or supernatural about the way we make it. Simply get the pure Vanilla beans, cut them into small pieces, then add Rock Candy and Alcohol, and just let the vanilla set three months in a cedar keg. Then pour off the clear liquid and bottle. This gives the purest, strongest Vanilla that is possible. **Crescent Drug Store** to make. Never was a drop made **AND** stronger, nor purer. For sale at **Burnett Mercantile Co.**

It is evident that Mr. Lahr has given this form of advertising his earnest attention.

Advertising Among the Farmers.—

The proprietor of Crafts Drug Store, Chagrin Falls, Ohio, is a persistent advertiser. At the county fair held

in that town last fall a booth was fitted up, and among other things a number of cards were handed out exploiting different products. We are reproducing one of these cards, and it will be found rather unique in nature. It contains no advertising beyond the intimation

To Prevent Diseases of Poultry

CURE FOR CHOLERA, ETC.

It keeps hens strong and healthy. Cheapest recipe on the market today, and one of the best. It's beyond comparison for keeping your chickens in fine condition.

Copperas 12 oz.

Blue Vitriol Half oz.

Cayenne Pepper 4 oz.

Venetian Red 8 oz.

Saltpetre 8 oz.

Mix

FOR LAYING HENS—1 tablespoonful to a gallon of soft feed. Feed in the morning.

FOR SICK HENS OR CHOLERA—Two tablespoonfuls in two gallons water.

Crafts Drug Store

CHAGRIN FALLS, OHIO

that the familiar substances mentioned on the card may be purchased at the Crafts Drug Store. A formula is given which the farmer will be glad to have, and he is quite likely to keep the card for this reason. When he wants the formula put up what is more natural than that he should go to this particular drug store for it?

Corralling the Baby Business.—

Ira E. Dunlap, 4 North Saginaw Street, Pontiac, is a man of original ideas. He gave a talk on salesmanship at the last meeting of the Michigan State Pharmaceutical Association, which attracted a great deal of attention. Afterwards we found that he was using a unique method for developing his business in baby supplies. Whenever he hears of the birth of an infant, he sends the following typewritten letter to the mother:

DEAR MADAM:

We desire to congratulate you on the arrival of a new baby at your home. They are always such dear little bodies, bringing so much sunshine into the house. They are considerable care, but what mother would part with one of them no matter how many hours of toil it occasioned?

Sometimes sickness comes to them, which we hope will not be the case with yours, but should you be so unfortunate you want the best medicine obtainable to restore it to health again, and we desire to remind you that our store is the newest and cleanest in the city. We take special pride in having our medicines strictly fresh and of the very purest, so that you can always rely on what you get here.

If you should have to feed the little one on prepared food, we have a complete line of all the popular foods, fresh every week, and we have a large stock of nipples, bottles, etc. When in health baby needs pure soap, talcum powder, nice soft sponges, and many other little accessories that we always have.

We are enclosing a card for you to complete with baby's name, and if you will bring baby and card to our store within three months we shall give baby a nice present, one you will be proud for it to have. It is not necessary for you to buy one

cent's worth to get the present. We like babies, so won't you please bring yours in so we can see it?

Wishing you a speedy recovery, and baby the best of health, we beg to remain,
THE PEOPLE'S DRUG STORE,
I. E. DUNLAP, Prop.

The card which Mr. Dunlap encloses with the foregoing letter is as follows:

O

Name _____

Born _____

Street _____

Mother

Mr. Dunlap has found that this method brings excellent results. Mothers are always pleased when the arrival of their babies is noticed even by a business man, and many times proud mammas have told Mr. Dunlap that he was the only person who had congratulated them and wished them good luck.

Some Specimen Advertisements for Duplicating.—

Not long since we received from the C. E. Zimmerman Co., Chicago, Ill., an interesting collection of sample ads. such as they supply to druggists who subscribe to their syndicated advertising service. They were all good, but we are taking the liberty of selecting four of them for reproduction at the bottom of this page. They are certainly worth using by the readers of this department of the BULLETIN who are looking for ideas. The drawings in the ads. can be easily reproduced into zinc etchings by any cut maker at a very slight expense—probably 60 cents apiece.

YOUR DOCTOR KNOWS

and will tell you that unless his prescriptions are filled with the utmost fidelity—with the purest and freshest drugs—all his ability to cure you will be wasted. Your prescriptions should be brought to this store where we pride ourselves on the care devoted to carrying out your physician's instructions. Ask your doctor—he knows.

While our prescription department is the best equipped in this store, we also have a well stocked stock of all the latest necessities in medical and sanitary supplies.

These are Some of Our Specials:

What Makes a Good Cigar?

Answer:—Enjoyment

TO give you satisfaction a cigar must be of the brand that pleases your taste—it must also be well kept—just sufficiently moist to burn evenly and fragrantly to the end—and the wrapper must hold neatly and smoke clean. Our cigars are like that and we carry all the best brands.

These are a few cigars we have in stock:

Name and address of store here in bold face type

A Stationery Ad.—

The Skidmore Drug Company of Skidmore, Mo., has used a circular devoted to stationery with good results. We are reproducing it herewith. It was a

“Our Destinies Lie in Our Education”

TRUE EDUCATION:

“The object of true education is not merely to make people do right things, but to enjoy the right things; not merely to be pure, but to love purity; not merely just, but to hunger and thirst after justice.”—RUSKIN.

We are prepared to sell stationery to the truly educated; those who are being educated, and those willing to be educated.

What Kind of Writing Paper do You Use?

Appropriate writing materials have as much to do with the success of your correspondence as appropriate clothing has to do with your person. It is just as important that a letter should be correctly dressed as it is that you should be when you meet the people to whom your correspondence is addressed. YOUR CORRESPONDENCE IS YOUR REPRESENTATION. Users of Good Writing Paper can be suited here, in the latest style box paper, or tablets with envelopes to match. We have paper from Eaton & Hurlbut, Whiting, Crane, and other good paper makers. Prices Always Right and according to quality.

WE SELL EVERYTHING FOR WRITING.
WE SELL EVERYTHING FOR SCHOOL.
POST-CARDS, STATIONERY AND SUNDRIES.
SCHOOL BOOKS AND SCHOOL SUPPLIES.

THE STORE OF QUALITY

Skidmore Drug Company

practice in the store to enclose the ad. in school-books, tablets, and stationery that were sold. The folder created quite a little comment among customers of the store.

BRING YOUR GIRL

to the splendid soda fountain at this drug store. She will find here courteous attention and the most delightful drinks in town. We cater especially to the ladies—our sodas, sodas and frappes were long ago voted just too delicious for anything by the prettiest women in town. Ask her—bring her in today—she wants to come anyway.

A cool half hour spent at this soda fountain is a very pleasant way of whiling away that time.

Name and address of store here in bold face type

WHEN YOU GET A LETTER

you often judge the sender by the stationery. Poor stationery makes a “cheap” impression. Other people judge you in the same way when you send a letter. See that your stationery is good. The difference in price between good and bad stationery is so small that you can afford to get the better kind.

Come in and look over our high class stock today. Our stationery department is the best equipped in this county. These are a few of our specials.

Name and address of store here in bold face type

Four good ads. worth borrowing and using.

BOOKS

"THE PREVENTION OF SEXUAL DISEASES."

Victor C. Vecki, M.D., writes in this small volume with great frankness of the venereal peril and the vital necessity of grappling with it in a direct and effective manner. Without mincing words he shows the vast amount of suffering of a thousand kinds caused by syphilis and gonorrhea, the great difficulty of curing either of these diseases, the millions of victims infected by them, and the remote and startlingly unexpected manifestations and sequelæ in nearly every organ of the body. He believes that the public cannot know too much about the real conditions, and that the foolish prudery which has always surrounded the subject must be abandoned in the interests of human life and health. He also believes, however, that even a full knowledge of the penalties will not suffice to quell men's passions, and he argues strongly for public segregation and the most rigid of supervision. Since prostitution cannot be wiped out—since the efforts of thousands of years directed toward its abolition have failed—he declares that the only sane thing to do is to cease all pretense of destruction and resort to intelligent regulation instead.

Incidentally we can scarcely refrain from injecting into this impartial epitome of Dr. Vecki's opinions our own oft-expressed opinion that in view of the terribly serious and prolonged character of these venereal diseases, no druggist should for an instant think of treating them or should have for sale either a remedy of his own or a proprietary mixture. This is trifling with human life in a criminal manner. In these days, when we know, or ought to know, what venereal disease means, we should send every case of syphilis or gonorrhea at once to a specialist—and the best one available at that.

"The Prevention of Sexual Diseases" is published by the Critic and Guide Company, 12 Mt. Morris Park, West, New York City. The price of the book is \$1.50, postage prepaid.

MERCK'S MANUAL.

Our readers will be glad to know that the new, fourth, edition of Merck's Manual is now ready for distribution. This little pocket book, while intended particularly for the medical profession, has much to interest the pharmacist. The first section is devoted to materia medica and embraces all those drugs and chemicals which are commonly used by medical practitioners. It tells the properties, doses and uses of different substances. The second part is given up to therapeutics. It summarizes the principal means of treatment for each form of disease and comprises many formulas in actual use by physicians. In part 3 the various drugs are classified according to their physiological action. The rest of the Manual is of a miscellaneous character containing useful hints and re-

mindings of every-day applicability. Among other things it comprises a comprehensive essay on poisoning and its treatment, a chapter on urinalysis, and an unusually exhaustive dose table of all the agents official in the United States, Germany and Great Britain, the preparations of the National Formulary and other remedies.

Merck's Manual is published by Merck & Co. and will be sent on receipt of forwarding charges of 10 cents in stamps to pharmacists or to students enrolled in any college of pharmacy in the United States.

A NEW BOOK BY FRANK FARRINGTON.

"Store Management Complete" is the latest book by Frank Farrington. We understand that Mr. Farrington has developed his avocation of writing for the trade papers to such an extent that he has sold his retail drug store in Delhi, N. Y., and has decided to limit himself in the future to journalistic and book work. The present volume is a reprint of a series of articles which have been appearing in a number of trade papers in different lines. The book aims to cover the whole subject of merchandizing in a brief manner, and the different chapters are devoted to the store arrangement, the buying of goods, the store policy, the management of clerks, leaks, expenses, the credit business, the giving of premiums, etc., etc. The book contains 222 pages, is bound in cloth, costs \$1.00, and is issued by the Byxbee Publishing Co., 440 South Dearborn Street, Chicago.

HISTORY OF THE VEGETABLE DRUGS OF THE U. S. P.

Bulletin No. 18, Pharmacy Series, No. 4, of the Lloyd Library in Cincinnati, is devoted to a "history of the vegetable drugs of the Pharmacopœia of the United States." Some of the historical articles in the brochure have already been appearing in the different pharmaceutical journals during the last month or two, and one of them, devoted to *Strophanthus*, was published in the BULLETIN OF PHARMACY for June. The gathering together in compact form of this historical data will make the book of great value in the years to come, and a feature of great usefulness, too, is the extended bibliography at the end of the volume.

SECRETARIAL CELERITY.

For several years Dr. H. M. Whelpley, in his capacity as secretary of the Missouri Pharmaceutical Association, has earned a reputation for promptness in getting out the proceedings of the association. This year, however, he has beaten his own record. The Mo. Ph. A. adjourned on June 16. Exactly thirteen days later, on June 29, bound copies of the proceedings were mailed to members and to the pharmaceutical press. This degree of promptness is quite equal to that shown by the monthly pharmaceutical journals—but then, you know, Dr. Whelpley is a pharmaceutical editor, which is sufficient by way of explanation.

CAPSULES OF SCIENCE

Prepared by PROF. W. L. SCOVILLE.

The Leaven of Investigation.—

German chemists say that glycerin in wines is not a true fermentation product, but is a product of yeast metabolism.

A concentrated lemon juice that will keep is prepared by evaporating the fresh juice in a stream of carbon dioxide and under reduced pressure.

Ferris oleate, prepared from Castile soap and ferric chloride, will dissolve in cod-liver oil and give a palatable and stable ferrated cod-liver oil.

E. Jordis defines colloids as "pure solid substances which as a result of their surface condition show peculiar chemical effects."

VonBolton thinks that diamonds were formed in nature by the action of metal vapors, such as iron or magnesium, on carbon dioxide. He has made microscopic diamonds by the action of mercury vapor on carbon.

Stilson says that rust can be easily removed from iron articles if they are first soaked in a strong solution of sodium hydroxide.

An Italian chemist says that commercial ether contains traces of an oxidizing body which can be completely removed by agitating with freshly-precipitated (or nascent) ferrous hydroxide.

Cleanliness Next to Tastiness.—

D. Gilmour says that for flavoring dentifrices, cassia oil is the most strongly antiseptic of any, but that it is irritating to the gums and liable to cause inflammation, and is also liable to discolor the teeth. Ceylon cinnamon oil is better in the latter respects. Clove oil comes next in antiseptic value, and is also anesthetic and non-irritating. Bay oil is similar to clove and is worthy of consideration in dental flavorings. Next in antiseptic value comes peppermint oil, then eucalyptus oil, which is a better antiseptic than eucalyptol. Oil of thyme comes next, but is slightly irritant. Wintergreen oil is much used, and is good as far as it goes, but is inferior to the others as an antiseptic.

The Right Weigh.—

O. Kuhn says that in a series of ten weighings of a porcelain dish within a month, a variation of 0.58 milligramme in weight was found, but when the weighings were corrected to vacuum the greatest difference was reduced to 0.06 milligramme. And J. J. Manley says that all balances undergo a shift in the resting point with changes in temperature, even if the balance be uniformly heated, and that uniformity in weighing can only be secured when the balance is kept uniform in temperature, and an interval of ten minutes between loading and weighing is allowed.

Another Round in the Sul-fite.—

E. Post has endeavored to learn whether sodium sulphite has any more injurious action on the system than common salts in general. He finds that when

given in concentrated form, it increases thirst, as does common salt, but if water be given freely the salt does not appear to have any injurious effect. It was given to dogs in doses of more than 2 ounces per day, and no evidences of poisoning or injury were found, even in these doses.

Just Naturally Cussed.—

H. Sassen says that he cannot find any difference in the action of natural and artificial camphor, in tests upon animals. The fatal dose for cats is the same for each, and their influence upon temperature is the same. He thinks that artificial camphor has the same medicinal value as the natural.

About Quinine.—

A. Graziani says that repeated, small doses of quinine, continued for a long time, tend to weaken the system and make it more susceptible to disease. Experiments on animals showed that they are more susceptible to cholera, typhoid, pneumonia, and anthrax. The blood does not appear to be altered, nor the phagocytes decreased, but the blood serum of men showed a decreased resistance to typhus after long dosing with quinine.

A Great Big Germicide!—

Dr. Koch says that the hippopotamus is the best preventive of sleeping sickness. This disease is caused by the bite of a fly which deposits the germ in the blood of its victim, and so causes the disease. The fly cannot live without feeding on crocodile blood, and the hippopotamus destroys the crocodile and its eggs. Hence the hippopotamus destroys the sleeping-sickness germ. See? Hip! Hip!

To Fold a Filter.—

P. E. Raaschou (excuse me!) says that with a normal funnel of 60 degrees the filter paper should be folded at an angle slightly greater than 90 degrees and the corner of the inner fold cut off to prevent an air channel forming. The upper portion of the paper should fit the funnel closely, and the tip should hang over the center of the stem.

What's Not So.—

Professor Power says that leptandra does not contain any glucoside, but does contain an intensely bitter amorphous product. "Leptandrin" contains this body. He also says that blue-flag loses all of its physiological properties by drying, and the dry drug is medicinally inert.

A Lemon for Health—or a Knock?—

G. Zickgraf says that limonine is much superior to oil of turpentine as an antiseptic and deodorizer, and in the treatment of lung diseases. It is more agreeable to take, is non-irritating to the kidneys, and is quite effective in reducing secretions.

Digest This!—

It is claimed that 10 per cent of glucose or 15 per cent of maltose entirely prevents the action of diastase on starch, but cane sugar has no effect. Milk sugar decreases it about one-third. Hence milk sugar is not a suitable diluent for diastase.

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

A Horse of Another Color.

N. A. S. wants the formula of a black and a blonde hair-dye for horses. He adds: "I have had great difficulty with the ordinary hair-dyes. The black dyes turn the horse's hair to a red color."

The most we can do is to suggest a dye that has been used on human hair. It should be tried in a restricted and experimental way first. The literature at our command makes no mention of a hair-dye intended especially for horses.

No. 1 Bottle.

Pyrogallie acid..... $\frac{1}{2}$ drachm.
Sodium metasilphite.....10 grains.
Water to make.....2 ounces.

No. 2 Bottle.

Silver nitrate.....1 scruple.
Strong ammonia water, a sufficient quantity.
Water to make.....2 ounces.

Dissolve the nitrate in $\frac{1}{2}$ ounce of water, add ammonia until the precipitate is redissolved, and make up to 2 ounces with water.

Two-bottle hair-dyes are put up in cases to hold a one-ounce bottle (No. 1) and a two-ounce bottle (No. 2), or proportionately larger bottles with two short-handled tooth-brushes of black and white bristle. The directions for use are as follows:

Cleanse the hair from all grease by washing it with warm water having a little washing-soda dissolved in it, and dry with a towel. Next pour a little of the fluid No. 1 into a saucer and apply with the white-haired brush; immediately afterwards use No. 2 in the same way with the black brush, avoiding as much as possible touching the skin. Wipe the parts round the hair receiving the dye with a damp sponge, and do not wash or grease the hair for several hours after its application. It is preferable to apply the dye at night.

The more silver there is in the preparation, the darker the dye is.

For blonde hair silver should not be used, but the following in the same manner:

No. 1 Bottle.

Potassium permanganate..... $\frac{1}{2}$ drachm.
Water1 ounce.

No. 2 Bottle.

Sodium hyposulphite.....1 scruple.
Water1 ounce.

Elixir of Creosote Carbonate.

For Several Querists.—Having recently received a number of requests for a formula of a compound elixir of creosote carbonate we submit the following. It is

suggested to us by our pharmaceutical advisers after a considerable investigation:

Beechwood creosote.....	15 minims.
Creosote carbonate.....	2 minims.
Terpin hydrate.....	30 grains.
Heroin hydrochloride.....	$5\frac{1}{2}$ grains.
Tartar emetic.....	5 grains.
Ammonium chloride.....	60 grains.
Sodium glycerophosphate.....	120 grains.
Granulated sugar.....	2 ounces.
Compound spirit of orange.....	5 minims.
Phosphoric acid (85%).....	60 minims.
Sugar, color yellow.....	$\frac{3}{4}$ grain or q. s.
Alcohol.....	2 ounces, 120 minims.
Glycerin.....	4 ounces.
Tokay wine.....	8 ounces.
Talc.....	sufficient.
Water, enough to make.....	1 pint.
Calcium glycerophosphate.....	60 grains.

Dissolve the creosote, creosote carbonate, spirit of orange, terpin hydrate, and heroin hydrochloride in the alcohol and add the glycerin. Dissolve the remaining substances in the wine and add this to the alcohol. Add water sufficient to make 1 pint. Age one week and restore any alcohol lost by evaporation; add talc, and filter through paper.

Looking over this formula several facts stand out. In the first place, about the only effective agent present is the heroin hydrochloride, though this is aided to some extent by the tartar emetic. Beechwood creosote is present only to the extent of 15 minims, and the creosote carbonate only 2 minims to the pint, but even these small quantities give a pronounced taste and flavor. A pleasant-tasting remedy of this kind containing not more than 25 per cent alcohol cannot be made if sufficient beechwood creosote or creosote carbonate is included to be therapeutically valuable.

Terpin hydrate is present in too small a quantity to be of any value. The same thing is true of ammonium chloride and the glycerophosphates.

An Excipient Wanted.

F. X. T. asks us to publish the following prescription and to give the proper excipient and mode of preparation:

Beechwood creosote.....	4.0.
Menthol	2.0.

Mix and make 60 pills. Direct one to be taken after each meal.

Prof. W. L. Scoville offers the following suggestions: Dissolve the menthol in the creosote, add three grammes of spermaceti, heat until the latter is dissolved, then chill. When the mixture has set, add enough wheat flour to make a stiff and somewhat crumbly mass; then mass with just a trace of mucilage of tragacanth.

Beeswax is often used for mixtures of this kind, but it makes a less soluble mass and one which does not dissolve or soften as promptly. Spermaceti has nearly the hardening properties of wax, but gives a mixture which melts at a lower temperature.

Powdered licorice is also used as an absorbent, but is decidedly inferior to wheat flour, both in absorbing and in massing properties. If the flour is adjusted right a good mass can be made without the use of mucilage of tragacanth.

Gelatin is sometimes used for pills of this character. Thus— $5\frac{1}{2}$ parts of gelatin and $2\frac{1}{2}$ parts of sugar are dissolved in 12 parts of water by the aid of heat. This mixture will absorb about one-half its

weight of creosote or a mixture like the above, and will "jelly" when cooled. To such a mass add enough flour or althæa (preferably the latter) to make a mass. But this method will make quite as large a pill as the one first given, and is more troublesome for single operations.

An Incompatible Eye Lotion.

J. W. submits the following query: "How can the following prescription be compounded so as to make a presentable preparation for an eye lotion:"

Hydrastine sulphate.....5 grains.
Boric acid2 grains.
Sodium borate.....4 grains.
Deodorized tincture of opium.....½ drachm.
Distilled water, enough to make.....1 ounce.

M. Sig.: A few drops in each eye three times daily.

Borax is alkaline in reaction and precipitates the hydrastine as free alkaloid, and also precipitates the alkaloids from the tincture of opium. The boric acid present is not sufficient to neutralize the alkalinity of the borax. As the preparation is to be dropped into the eye, it should be filtered, but in so doing nearly all of the hydrastine is removed. The physician's attention should be called to this, and he be advised to increase the amount of acid or decrease the borax, or, what is better, leave out the latter entirely. Boric acid does not give a precipitate with a solution of hydrastine sulphate. Or, the prescription can be filled by adding five to seven drops of glycerin directly to the borax, mixing well, adding part of the water, then the other ingredients. Water precipitates a little resinous matter from the tincture.

A Tooth-wash.

A. G. P. remarks that he had tried many standard formulas for tooth-washes printed in the books and drug journals, but he doesn't find one that gives him "that pleasant and lasting taste" possessed by some of the proprietary articles.

Prof. W. L. Scoville suggests something on the following order:

Thymol30 grains.
Menthol30 grains.
Oil of peppermint.....30 minims.
Oil of birch.....2 drachms.
Oil of cinnamon.....20 minims.
Oil of eucalyptus.....1 drachm.
Alcohol1 pint.

This is a more strongly alcoholic preparation than those customarily employed, and Professor Scoville thinks that A. G. P. has been trying some of the published formulas which are more weakly alcoholic in nature. This is why, perhaps, the taste hasn't been sufficiently strong and lasting.

A Strange Discoloration in Phenacetine.

N. S. writes us as follows: "I would be much favored if enlightened on the cause of the following: One sample of phenacetine gives a slight blue coloration on the addition of rum, which intensifies on standing, whilst another sample behaves in quite a different manner, giving the usual colorless solution.

Some powders of No. 1, my first stock, were returned by a customer with a letter bearing a complaint. Which is correct?"

The best explanation that we can make is that the specimen No. 1 may contain a trace of iron, which would react with the tannin in the rum to give the color. Iron is not a common impurity in phenacetine, but might occur.

Preserving Fruit.

C. J. H. Co. wants a formula for preserving fruit. Add one-tenth of one per cent of sodium benzoate. Dissolve the preservative in water and add the solution to the fruit pulp. This is done just before the fruit is removed from the fire and after it has been boiled with sugar. The hot fruit is then poured into heated sterilized jars and sealed hermetically. Of course, the preliminary operations will vary with the nature of the fruit. Fill the containers full. In heating the jars put them in cold water and raise them to the boiling point.

Film Cement.

W. R. B. asks us to publish the formula of a film cement for non-inflammable picture films.

The following formula was given us by an experienced photographer:

Ether2 ounces.
Acetone4 ounces.

Take a strip of non-inflammable film about 8 inches long, cut it up into small pieces, and dissolve them in the solution.

This, we are told, is a very good cement for the reason that it works quickly.

Tincture of Horseradish.

G. F. S. wants a formula of a hair preparation containing horseradish root. We suggest a tincture of horseradish as a working basis of such a compound:

Horseradish root, freshly grated....5 ounces av.
Alcohol4 ounces av.
Diluted alcohol, a sufficient quantity.

Macerate the drug with the alcohol for several days, agitating twice daily. Then transfer it to a percolator, allow the liquid to drain, and pass enough diluted alcohol through the drug to make the total percolate weigh 10 ounces avoirdupois.

Increasing the Specific Gravity of Simple Elixir.

R. B. C. wants an elixir base that will produce a preparation somewhat heavier than simple elixir and of a slightly greenish color. We suggest that in making his simple elixir he substitute glycerin for some of the water to make it heavier. The elixir can then be colored with chlorophyll or tincture of hemp-seed.

Rat Pastes.

F. J. B.—Several formulas for rat pastes, made with and without phosphorus, were printed on page 480 of the BULLETIN for November, 1910, and we refer you to that rather extensive treatment of the subject.

GENERAL ESSAYS

ESSAYS IN BRIEF.

BY HARRY B. MASON.

One thing at a time—and that the necessary thing!

A cultivated man should "know something about everything," and "everything about something."

Make no resolves of what you will *not* do; resolve what you *will* do. Let your philosophy be positive, not negative.

The chief value of books is to give us a larger capacity to understand the greatest book of all—the Book of Life.

Pride without courtesy is mere egotism; dignity without courtesy is mere arrogance; and yet pride and dignity are very desirable qualities.

The greatest purpose of knowledge is to give us an understanding of life, and the highest function of the past is to teach us the present.

Learning harnessed with action: this is the ideal combination. Each without the other is incomplete; together they mean power, success, efficiency.

The men who are born and reared close to Nature's heart are the men of power; and it is the country boys who become the most successful men in our great cities.

Freshness of view and initiative come only to the rested brain, and to the man who periodically gets away from his business and looks at it objectively from a distance.

Do the important thing first, and let the comparatively unimportant thing wait upon it—this wise rule of action, like every other, should be applied with wisdom and modified in accordance with one's environment.

I take it that success, however we define it, depends upon the harmony with which we adapt ourselves to our environment and make it minister to our pleasure, our profit, and our well-being and well-doing generally.

That legislation is ineffective, and may even be harmful, which does not hold itself backward to keep pace with the evolution of public sentiment, and which does not secure its strength from an enlightened public support.

Pretty much everything depends upon making up one's mind to follow a certain course of action; and most things are left undone, not from lack of time or capacity, but from the absence of a determination to achieve them.

Education in the broad sense is the basis of the social structure. It is the foundation stone in the progress of any race, any nation, any calling, any individual. To build the house upon anything else is to build it upon the sand.

Strength comes largely from opposition. The things which develop character and power are not coddling, wealth of opportunity, nor the education of the schools. Trials, difficulties, obstacles—these are the forces which make for greatness.

Knowledge is made up of the essential and the un-

essential. The essential should be remembered; the unessential should be forgotten. And the mind that performs this sifting process with the greatest perfection is the mind that attains the greatest power.

The highest need for reading is not that we shall store our minds with information, but that we shall come in contact with that knowledge of men and things which will develop our faculties, widen our vision, train our judgment, increase our wisdom, and enhance our mental grasp and resource.

The secret of a man's success is in the man *himself*. The particular methods he uses of course assist him in reaching his goal, but different men are guided by different methods, and no course of action is worth a picayune unless a man of strength stands behind it and electrifies it by his determination.

There are few men in the world who know how to use their time to good advantage. They waste precious minutes and hours without knowing it, and their familiar remark is, when asked why they did not perform this duty or that, "I haven't time for it; I am too busy." They *do* have the time, but they don't know how to use it.

Determine to succeed and you **WILL** succeed. Once make up your mind, *and keep it made up*, and no power on earth can hold you back. **DETERMINATION** is the word—this is the only "secret of success"—this is the philosopher's stone—this is the thing which will push and drive you uphill and through obstacles and over defeats.

Far from being a reason why a man should be kept down, obstacles, indeed, supply a reason why we should succeed—that is, if he has the latent possibility of success in him. Put obstacles in a man's way and he has to overcome them; and in overcoming them he develops a strength and a resource which are his very best equipment in the race for success.

Stern self-denial, determined effort, the constant putting forth of one's best powers; simplicity, virtue, toil, struggle—these are the elements of success, for the individual no less than for the nation. And the individual or the nation which forgets or ignores this truth must expect to pay the penalty. There is no alternative. Royal roads to achievement, like those to learning, can end only in disaster.

When we have come to know perfectly that to kick against the pricks is not only useless, but is wasteful of time and energy that should be husbanded and used to better advantage, and when we have been brought to realize that we must keep pace with changing conditions if we are to succeed in the struggle for existence, the battle of life is already half won. To bring ourselves to this realization is then our first duty; and the rest shall follow in due time.

Habit—and by habit I mean the combined results of custom, inclination and nature, hardened through long and constant usage into definite characteristics—habit is the strongest motive power in our lives. The vast majority of things we do spring unconsciously and inevitably from habits of mind and body. How essential is it to our success and happiness, then, that we form habits which will lead us naturally to do the wise, the good, and the right thing!

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., SEPTEMBER, 1911.

No. 9.

THE

BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, Ph.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico, . . . \$1.00 per year
Foreign countries, . . . 1.50 per year

FOREIGN OFFICES:

WALKERVILLE, ONT., CAN.
378 ST. PAUL STREET, - - MONTREAL, QUE., CAN.
19 AND 20 GREAT PULTENEY STREET, W., LONDON, ENG.
125 YORK STREET, - SYDNEY, N. S. W., AUSTRALIA.

All articles for publication and all communications bearing on the text should be addressed:

EDITOR BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY

BUCKING THE TRUST.

C. M. Rawlins, a graduate of the department of pharmacy of Columbia University, has been in business in Cleveland for fourteen years. His cigar sales are said to amount to a hundred thousand a year, but none of his brands are trust made. In fact Mr. Rawlins has always had a marked indisposition to such goods.

Imagine Mr. Rawlins's feelings, then, when he came down to work one morning to see a sign near his drug store: "This room will be occupied by a United Cigar Store. Wait for our opening. A present for every one." This was the signal for a fight and Rawlins was not the man to evade it. He wrote a letter of protest to U. S. District Attorney Denman, who said it looked like a restraint of trade to

close the proposed store. Rawlins then went to his attorney, who told him to forget the trust. Still not discouraged Rawlins laid his case before Attorney-General Wickersham. He promised an investigation. Shortly a letter was received from Denman, who was evidently coöperating with Wickersham in favor of the druggist. Finally through Mr. Rawlins's initiative, it is alleged, the United Cigar Stores Company was adjudged to be a part of the tobacco trust and enjoined from extending its operations or making further contracts with the parent company. This decision was in Rawlins's favor. The proposed trust store at E. 55th Street disappeared. Rawlins had won out. As a result of this decision, no new establishments will be opened by the United Cigar Co. until the expiration of the six months given by the court for the reorganization of the trust. For the Supreme Court has forbidden the American Tobacco Company from enlarging its own business or that of its subsidiaries until the reorganization ordered by the court has gone into effect. Mr. Rawlins had been shrewd enough to see this point, and realized that under the decision the Trust was constrained from opening any new stores. There was little litigation involved, as the counsel of the United Cigar Co. accepted the ruling of the Department of Justice without contention. This department had made it plain to the Trust that if it persisted in its attempt to open new stores, the government would apply to the courts for an injunction that would check all further expansion.

* * *

OPPOSING THE SHERLEY BILL.

At the last annual meeting of the Michigan State Pharmaceutical Association the members took a firm stand against the Sherley Bill. Other States are showing the same animadversion to the measure. A protest against the Sherley stamp tax bill was ordered sent to all the Maryland representatives in Congress. The New York State Pharmaceutical Asso-

ciation also went on record against the stamp tax on proprietary remedies. It will mean just so much money exacted from the pharmacist. It must come out of his pockets because it will be impossible on practical grounds to increase the retail price of proprietaries proportionately to the amount of the tax. To pass resolutions in the State meetings in condemnation of the Sherley Bill is insufficient. Personal appeal to the congressman and members of the State legislature will do more to kill the bill than will the more formal motions of the pharmaceutical bodies. The members of the legislature cannot always tell what interests are behind a convention to prevent a tax of this character, but they lend a willing ear to any argument that the individual druggist may advance against the bill. The State associations are therefore doing their utmost to kill the Sherley Bill not only in convention assembled, but they are urging their constituent members to use their personal influence with those in power.

* * *

TURLEY BILL AND THE "WORLD."

The Turley Bill fathered by the *New York World* and fought by the druggists everywhere met a peaceful death finally at the hands of the New York legislature, as was reported some time ago.

The *World* is to be forgiven for its recent attack on pharmacy. In this age sensationalism is one of the characteristics of the press. The penny sheet champions of the people's rights must have a certain amount of scandal to satisfy the appetites of blasé readers. And if the current supply of human depravity is insufficient to furnish material for extra editions, events in pharmacy must be pressed into service. Druggists need not be surprised, therefore, if papers that excite mobs to violence, pit class against class, stir up the poor against the rich, invade the sanctity and privacy of homes, particularly of the upper classes, for facts better left unsaid but none the less stimulating to the jaded curiosity of the paper-buying public, should enter even the quiet drug store in quest of news. Not a few druggists are on the *qui vive* lest the recent startling revelations of certain newspapers be the beginning of a national movement on the part of the press to extract sensational themes from the conduct of the pharmacist. The

newspapers no doubt have a grievance against pharmacists of this country because they furnish very little of the sensational material that feed columns of penny papers and swell their circulation. You never hear of a druggist setting fire to his store. You never read of a murder with all its interesting side-lights in which a druggist participated unless in the person of the victim. You never hear of a druggist's daughter eloping with a chauffeur. A group of drug clerks have never been known to hire an automobile and go out on a wild and hilarious joy ride only to end up by winding the car around a lamp-post. And as for a divorce or a juicy family scandal, such a thing is unheard of in druggdom. So considering the virtue and rectitude of American pharmacists, the newspapers have reason to feel that the druggists of this country have never furnished their share of news for the glaring headlines and sensational columns of the leading dailies.

Let every druggist look to his shop and make sure that everything is above reproach. The reporter must be made to realize that the pharmacy is a poor place in which to seek material for the press.

* * *

MORE CONVIC- TIONS.

An amusing feature of recent news is found in the fact that some time after the Supreme Court had declared therapeutic claims not to be involved in the food and drugs act, the Department of Agriculture sent out a grist of judgments recorded against a considerable number of patent medicine manufacturers whose offense was that they had made exaggerated curative claims for their products. These judgments were all rendered, of course, prior to the decision of the Supreme Court, but they were not published until afterwards. One of the cases was a libel suit against a number of packages of an aphrodisiac manufactured by a concern which called itself by the very appropriate title of "The Sporty Days Invigorator Co." The government held that the product was misbranded in that it had no aphrodisiac properties, was not a cure for disease, and had none of the virtues claimed for it on the label. The manufacturers pleaded guilty and judgment was therefore filed against them by the court.

In another case, however, the defendant manufacturer fought the contention of the government and won out. This was a libel filed against some packages of Buffalo Lithia Water. The Supreme Court of the District of Columbia rendered a decision in favor of the manufacturer and based it largely upon the Supreme Court decision in the Johnson cancer case. The court held that there was no standard for lithia water in the Pharmacopœia; that no curative claims were made for the product on the package; and that if they had been made they could not be reached through the food and drugs act.

* * *

TEN-CENT SODAS IN DETROIT.

Soda dispensers all over the country may be interested in a movement among the drug

stores in Detroit to make ten cents the regular price of ice-cream soda in this city. Five cents was the charge until recently when several fountain owners got together and agitated a movement to raise the price to ten cents. Everybody is falling into line. A few candy stores are still selling five-cent ice-cream sodas, but the beverages are distinctly inferior to the quality that is dispensed at drug-store fountains.

As for the people, they are perfectly willing to meet the raise in price. Certainly they ought to be. A sundae brings ten cents, but the price of the material that enters into a sundae hardly exceeds that of an ice-cream soda. And if people are willing to pay ten cents for the one, they should be equally willing to give as much for the other. In most of the largest cities ice-cream sodas cost ten cents, and this should be the universal price. In Detroit several druggists have put up signs reading: "Ice-cream sodas, 10 cents."

This saves any further explanation. People see when they sit down at the fountain that the beverage costs two nickels, which prevents any altercation after the soda has been dispensed.

* * *

MEETING OF AMERICAN CHEMICAL SOCIETY.

At the recent meeting of the American Chemical Society in Indianapolis, the Division of Pharmaceutical Chemistry had three most interesting sessions with an attendance of from twenty to fifty members and visitors. B. L. Murray, of Rahway, N. J., was the presiding

officer, and in his remarks at the first session congratulated the division on having doubled its membership since the beginning of the year, the present membership being over 150. A paper on Pharmacopœial Revision by Prof. Joseph P. Remington induced a very interesting general discussion on pharmacopœial matters. A luncheon was then served to the members and visiting ladies at which a number of the most prominent pharmaceutical men of the country were speakers. Every one in attendance at this meeting agreed that the division had become a very important factor in pharmaceutical progress. The next meeting will be held in Washington during the Christmas holidays, and it is hoped that it will have the support of all persons interested in the development of pharmaceutical chemistry.

* * *

PROMINENT CHICAGO PHARMACIST DEAD.

Last month members of the C. V. D. A. buried their oldest charter member, Anton Hottinger. The funeral at the house and church was in charge of a clergyman. At the open grave, according to the wish of the deceased and family, the services were under the auspices of the C. V. D. A. Among those present was Otto G. Hottinger, son of the deceased, himself an active member of the C. V. D. A. President I. N. Jamieson conducted the exercises, and called on Honorary President O. F. Fuller, who made a brief but very impressive address. At the request of the family W. Bodemann closed the services in German. As he stepped to the grave, he dropped into it a red carnation, the official flower of the C. V. D. A. The members of the organization, who were all pallbearers, then came forward, and after the custom of their association, paid this last tribute of friendship and respect to their dear old comrade.

* * *

MAPLE SYRUP SOPHISTICATIONS.

Owing to the scarcity of true maple sugar there have been attempts to compound a substitute, and some of the artificial maple flavors on the market are very successful. But the label must be free from any falsity or equivocation. The Bureau of Chemistry of the United States Department of Agriculture has been examining maple syrups on the market, with the result that several manufacturers

have been convicted of adulteration and misbranding. In some instances there was 50 per cent of cane-sugar present in supposedly pure maple sap. Several hundred cases of maple syrup were seized, condemned, and sold at public auction, the proceeds going to the government.

* * *

SCHOLARSHIPS.

The Committee on Scholarships of the New York State Pharmaceutical Association is doing excellent work. It reported at the recent annual meeting of the Association that three scholarships had been secured last year and that four would be available this year. These four will be given by John L. Thompson & Sons, Samuel E. Bradt, the Kings County Pharmaceutical Society, and the Alumni Association of the New York College of Pharmacy. In the meantime the Massachusetts State Association has voted to continue its scholarship in the Massachusetts College of Pharmacy. We recall, too, that the New Jersey and Texas Pharmaceutical Associations maintain scholarships, and possibly there are others. The idea is commendable in every respect.

* * *

NEW DEAN FOR THE CLEVELAND SCHOOL.

The Cleveland School of Pharmacy has been fortunate to procure as Dean Dr. Norman A. Dubois, S.B., M.A., Ph.D., formerly of the Case School of Applied Science. Dr. Dubois's wide experience and efficient work in several of the leading seats of learning in this country, including Brown, Syracuse and New York Universities, renders him preeminently qualified to take charge of the school. His teaching has extended not only along lines of pharmaceutical chemistry and physics, but also along the most advanced branches of chemistry. Dr. Dubois is one of the best selections possible and has been elected to maintain a high standard in the school work.

* * *

REORGANIZING THE AMERICAN TOBACCO CO.

The officers and attorneys of the American Tobacco Co. are perfecting a plan for carrying out the decree of the United States Supreme Court ordering a reorganization of the Trust in harmony with the law. The decision ordering this readjustment was

rendered May 29, and the company was given until December 29 to carry it out. Some idea of the size of the American Tobacco Co. may be seen from the following figures: There are \$103,220,100 worth of outstanding bonds. The preferred stock amounts to \$78,689,100; the common stock \$42,242,400. What an enormous undertaking must be the readjustment of such a large combination whose securities are distributed all over the world!

* * *

THE PARCELS POST SITUATION.

The druggists of this country have been much concerned over the parcels post question. They appear to be divided on the subject. Some States are favoring parcels post, others oppose it. From present indications there is little likelihood of the country plunging bodily into the new system. Congress is showing a desire to try it out experimentally first. Bills are up for consideration that do not look for an establishment of a complete parcels post, the idea being to try it out in a restricted way first. The sudden adoption of a parcels post without due limitations represents a radical move that Congress is not yet prepared to make.

* * *

ADULTERATION OF ICE-CREAM CONES.

The Department of Agriculture appears to be conducting a systematic campaign of prosecution against manufacturers of boric acid ice-cream cones. It has seized upon crate after crate of the goods in various parts of the country, samples being submitted to the Bureau of Chemistry. Where the findings of the analyst revealed boric acid the product was condemned as injurious and adulterated within the meaning of the Food and Drugs Act. The cones preserved with the deleterious boric acid were seized and destroyed. In some instances fines were imposed on the manufacturers.

* * *

The New York State Pharmaceutical Association has voted to employ a State canvasser for the purpose of securing new members and of developing interest generally in the work of the organization. The Pennsylvania Association employed a canvasser for two or three months last year, and the net results were that over 400 new members were elected at the annual meeting a few weeks ago.

EDITORIAL

A STIMULANT RATHER THAN A DEPRESSANT.

A year or two ago, when there was a sudden growth in the chain-store movement in the East, more or less fear was exhibited that the situation would ultimately bear hard upon the small individual druggist. We argued at the time that these fears were without much foundation in fact, and we have been pleased to see that a saner view of the conditions is gradually being taken.

The subject was interestingly discussed at the annual meeting this summer of the New York State Pharmaceutical Association. C. A. Drefs of Buffalo read a paper of which the thesis was that the chain-store system could never take away from the retail druggist the personality he chose to exert. If good business methods were followed, and professional pharmacy practiced, the outlook for the druggist would not be darkened, and Mr. Drefs believed that there was just as much money to be made in the drug business as there ever was.

The resulting discussion was of course somewhat varied in character, but on the whole the consensus of opinion was apparently in support Mr. Drefs's contentions. Dr. W. C. Anderson was inclined to think that the individual pharmacist could save himself by more attention to the professional aspect of his business, and he spoke warmly of the importance in this connection of propaganda efforts with physicians. Others seemed to feel, however, that it would not be enough to cultivate professionalism alone, but that the druggist must compete in every particular with the chain-stores and the big down-town establishments. Every feature of the business must be developed aggressively, and if this were done there need be no fear of competition from any source whatsoever.

Thomas Stoddart, of Buffalo, hit the nail squarely on the head when he declared pungently that the chain-store would prove to be "a stimulant rather than a depressant to the retail druggist," for it would show him the necessity of greater hustling and would develop him into a shrewder business man and

a better pharmacist. This indeed has been the history of commercial success in the United States from colonial times onward. New competition, larger enterprises, better methods have always acted as tonics, and have stirred American business men on to greater and greater efforts.

THE GRADUATION PREREQUISITE MOVEMENT.

It is very apparent that the enactment of legislation looking toward the establishment of the graduation prerequisite is going to be a matter of slow growth. Five or six years ago, when New York and Pennsylvania followed each other in rapid succession, and when the territory of Hawaii and the State of Rhode Island came along soon afterwards, it was thought by some pharmacists that the movement would spread with more or less rapidity. Before any new era of this kind can be ushered in, however, public sentiment—in the present case pharmaceutical sentiment—must be developed in favor of it, and this truth is being evidenced every year as one effort after another is made to enact graduation prerequisite laws.

We have already reported in the BULLETIN that during the last winter prerequisite bills failed in the legislatures of Illinois, California and Washington. The winter before other measures likewise failed in the legislatures of Michigan and one or two other States. In practically every instance success was unrealized because too little support had been developed. Public sentiment had not yet become strong enough. The pharmacists in all of these States, however, are still discussing the question, and it may be expected that the agitation in favor of the graduation prerequisite will continue. In most of the States where legislation has already been attempted the State associations have decided this summer to continue the fight.

The proposition has been up in New Jersey for a number of years, and was apparently brought to a head at the recent annual meeting of the State association. Last year the association instructed its Committee on Legislation to prepare a pharmacy bill providing among other things that candidates for registration as proprietors must have graduated from recognized colleges of pharmacy. This

year, when the committee reported, it presented a bill containing the graduation feature, but with the modification that registered assistants having had three years' experience before registration might, after three years of additional experience in New Jersey itself, come up for examination as registered pharmacists. A motion to strike out this qualification precipitated a hot debate, but the motion was finally carried by a vote of something like 44 to 26. The Committee on Legislation will introduce the measure at the next session of the State legislature, and the bill will consequently call for the graduation prerequisite in its pure form without modification or qualification.

Since the failure of a graduation prerequisite measure in the Michigan legislature two or three years ago, there has been more or less doubt that the pharmacists of the State were in favor of such a bill. In order to settle the question the State Association last year decided to take a vote by mail. Unfortunately the voting papers were sent out in reports of the State Board of Pharmacy, and apparently many druggists failed to find or see them. As a consequence only 261 druggists voted, but it is a fact of possibly considerable significance that 200 expressed themselves in favor of prerequisite legislation, whereas only 61 voted against it. If this accurately represents the proportion of sentiment for and against the movement, it would seem that success is not far distant.

We may say in conclusion that much of the sentiment against the graduation prerequisite is based upon a misconception. Many druggists apparently think that clerks will be involved as well as proprietors, and that there will be a consequent difficulty in getting assistants. On the contrary, however, every graduation prerequisite bill, so far as we recall, would have made graduation compulsory only in the case of registered pharmacists, or in other words proprietors. Assistant pharmacists are not brought within the scope of such legislation at all, so that a clerk may still continue as such without going through a college of pharmacy. Furthermore, even if this were not so, it is an open question whether the imposition of compulsory graduation would not increase instead of decrease the clerk supply by making the pharmaceutical profession more attractive to the right kind

of young men. It must be pointed out, too, that no graduation prerequisite law would be retroactive. It would not affect men who are now registered, and would only apply to board-of-pharmacy candidates of the future.

THE ELEMENTS OF A REPUTATION.

J. Leon Lascoff, a pharmacist well-known in New York State for his professional and scientific activities and a member of the Board of Pharmacy, read a paper at this year's meeting of the State Association outlining the "essentials of a reputable pharmacist." Mr. Lascoff gave it as his opinion that in the last analysis reputation must determine the pharmacist's success. Such aids as capital, location and the like were quite in vain unless backed up and supplemented by this fundamental requisite.

The essentials of a good reputation for the pharmacist were declared by Mr. Lascoff to be ten in number:

1. Making proper window displays.
2. Practicing sanitation in store and prescription room.
3. Close attention to and personal supervision of the store.
4. Proper advertising to physicians on new preparations and drugs.
5. *Honest* advertising.
6. Buying only the best drugs and chemicals in the market.
7. Courtesy and amiability to customers.
8. Avoiding the "just as good" habit, and misrepresentation.
9. A checking system in the prescription department.
10. The proper standardization of drugs, chemicals and preparations.

These ten suggestions are the fruit of many years of experience, and Mr. Lascoff declared that he had time and again had their importance forced home to him when dealing with clerks, and more recently when examining candidates for registration by the Board of Pharmacy. That Mr. Lascoff is himself qualified to give advice in these particulars is somewhat evidenced by the fact that he has dispensed 236,000 prescriptions within relatively few years' experience as a proprietor. One of his pharmaceutical window displays was reproduced in last month's issue of the *BULLETIN*, and was unusually attractive.

Dr. J. D. Humphrey.

The Alabama leader and N. A. R. D. man in his rôle as Mediator between Pharmacists and Physicians.

This year's convention of the Nebraska State Pharmaceutical Association was held in the town of Fairbury in the southern part of the State. A. V. Pease, well-known to the members of the A. P. A., and one of the prominent citizens of Fairbury, was mine host par excellence. In the present picture the members are watching one of the athletic events, and Mr. Pease may be seen on a rostrum in the center of the crowd looking like an auctioneer.

This group, sitting comfortably in the shade in order to watch a 100-yard race, comprises Mrs. A. V. Pease, Mrs. Harry B. Mason, Mrs. Charles R. Sherman, A. V. Pease, Charles R. Sherman, and Prof. Charles B. Fricke.

First row standing, left to right, Harry B. Mason, the special guest of the association, Charles R. Sherman, D. J. Killen, W. D. Mowry, Professor Redfern, S. C. Wilson; second row, on their knees, left to right, J. G. McBride, J. E. Harper, G. B. Christoph, A. W. Buchheit, Herbert Lock; third row seated, W. M. Widener, D. J. Fink, A. V. Pease, L. W. McConnell.

Here we have, reading from the left, Professor Fricke again, Charles R. Sherman, D. J. Fink, the editor of the BULLETIN, Professor Kreitzinger, Dr. R. A. Lyman, and Francis Hedges.

Some of the A. Ph. A. Members at the Boston Meeting Last Month.

THE BOSTON MEETING OF THE A. PH. A.

Eloquent Address of Dr. Solomon Solis-Cohen the Feature of the Week—James H. Beal Elected General Secretary and Editor of the Proposed "Journal of the A. Ph. A."—The Colleges Decide to have Themselves Investigated—A Federation with the N. A. R. D. Proposed—The N. F. Nearly Ready for the Printer—A National Conference on Legislation to be Called—Denver Selected for Next Year.

The Boston meeting last month of the American Pharmaceutical Association was interesting and profitable on the whole, although it failed to develop anything remarkable or sensational. Perhaps the most delightful feature of the week was an extemporaneous address delivered by Dr. Solomon Solis-Cohen of Philadelphia on the Relationship of the U. S. P. to the Physician. Dr. Cohen's speech of thirty minutes or

The Hotel Vendôme, where the convention was held, and where most of the members were quartered.

more was a model of clear thinking, happy phrasing, and convincing logic. As everybody knows, he is chairman of the very important Sub-committee on Scope of the U. S. P., and it has been the duty of his committee during the last year to decide what articles shall be admitted to the next revision, and what shall be deleted therefrom. Decisions have now been reached in all except a few cases, and the two lists of admissions and deletions will be found printed elsewhere in the present issue of the BULLETIN. The articles to be included in the next U. S. P. are now ready for detailed consideration by the various sub-committees of revision, so that from now on the work can be conducted with considerable speed.

DR. COHEN'S ELOQUENT ADDRESS.

Dr. Cohen's address was an eloquent plea for the intelligent use of drugs on the one hand, and for a reasonably broad Pharmacopœia on the other. He declared that in this skeptical day there were doubts in some quarters of the remedial virtues of medicinal substances, but he caustically remarked that there was scarcely any subject about which so much nonsense had been written. Drugs are frequently abused, it is true, but this should not condemn their proper and wise

employment. Other remedial measures so popular today are likewise capable of great abuse. Air, light, water, massage, mechanical manipulations, mental suggestion, electricity—in these and in all other drugless measures mistakes are quite as frequently made as in the employment of drugs. Neither extreme is sound, and the truth is as usual to be found in the middle of the road. The wise physician is the man who uses all remedial methods when necessary to combat disease, and who uses them with discrimination and intelligence.

Dr. Cohen made it clear, however, that in order to use drugs intelligently they must be studied with more care than has frequently been devoted to them. He stated that for twenty-five years at least medical students had failed to receive the enthusiastic and thorough instruction in medicinal substances to which they were entitled. A thorough knowledge of drugs could be based only upon laboratory experimentation on the one hand, and bedside experience on the other. Either alone was insufficient. Both must be taught, and it has largely been the unwise dependence upon one or the other which has made the physician's knowledge of drugs incomplete and has assisted in the spread of skepticism. "From Vienna," pungently declared Dr. Cohen, "has spread the infection of therapeutic nihilism quite as effectively as cholera has come from the tainted wells of Mecca."

Dr. Cohen indulged himself in an eloquent panegyric of the country doctor. He declared that he had often met with him in consultation and that he knew him and his methods thoroughly. He asserted that the country practitioner frequently uses some drugs which

The Art Museum in Boston, one of the places of great interest in the city.

might be considered obsolete, but he does so from long experience and thorough knowledge, and he gets results. Dr. Cohen aroused great applause when he asserted that he himself would be the last man to deny recognition in the Pharmacopœia to the drugs used so wisely by the country doctor. He believed also that the U. S. P. ought to include all of the accepted biological

substances. So far it has been decided only to add antitetanic serum to the antidiphtheric serum recognized in the last revision. Dr. Cohen concluded his address with the eloquent assertion that he wanted to see every substance recognized in the Pharmacopœia which was really useful in the intelligent treatment of disease.

The address was vigorously applauded for several minutes, after which John Uri Lloyd, John B. Bond,

The Massachusetts College of Pharmacy at the corner of St. Botolph and Garrison Streets in Boston.

Sr., Dr. F. E. Stewart, James M. Good, and others spoke most enthusiastically of Dr. Cohen's remarks and seconded a motion to give him a rising vote of thanks. In addition to this it was voted to request the committee on publication to secure as wide publicity as possible for the address, and particularly to request its insertion in the *Journal of the American Medical Association*.

THE NEW "JOURNAL OF THE A. PH. A."

Perhaps the most important feature of the meeting, so far as the future welfare of the association is concerned, was found in the final perfection of plans for the issuance and publication of the "Journal of the American Pharmaceutical Association." The new official organ will begin its career on the first of January next, and it will be under the wise editorial and business management of Prof. James H. Beal. Upon the selection of the editor-in-chief practically depends the success of the whole enterprise, and the association is to be congratulated that Professor Beal was willing to make the financial sacrifice involved in the acceptance of the position. There is perhaps no man in the country who has a better equipment of sound sense, loyalty to the organization, literary capacity, and constructive ability. That he was willing to give up most if not all of his various interests, and devote himself unreservedly to this enterprise on behalf of the A. Ph. A., speaks volumes for his devotion to the cause.

The position of editor was combined with that of general secretary. Charles Caspari, Jr., who has been general secretary for a period of nearly twenty years, unconditionally refused to continue longer in office.

He insisted that he had served long enough, that his new duties as food and drug commissioner of Maryland consumed so much of his time that it became necessary to cut corners, and that in any event the position of editor and general secretary ought to be combined in the interests of effectiveness and economy. It was decided that the new incumbent of the *Journal* position will receive \$3000 a year. This is, of course, too small a figure to remunerate the services of a man of Professor Beal's character and ability, but it is generally believed, with how much truth we are unable to say, that he is financially independent to a greater or less degree, and is apparently able to make a sacrifice of this kind.

In response to a recommendation of President Eberle, it was decided to appeal for subscribers to the *Journal* outside of the membership of the organization, and it is hoped that the publication of an official paper will ultimately result in a considerable enlargement of the membership. It was generally felt that there were opportunities in the proposition, and that Professor Beal was just the man to develop them. Two offers of free offices for the *Journal* were made by the Pittsburg College of Pharmacy and the Pharmacy School of the Ohio State University in Columbia. Professor Beal was given only a beggarly allowance of \$750 for clerical assistance, which means one stenographer, but he will doubtless be able to show next year the necessity for more help and more liberal appropriations.

TO INVESTIGATE OR NOT TO INVESTIGATE?

One of the most diverting features of the Boston meeting was developed on Wednesday evening at the session of the Conference of Pharmaceutical Faculties. The executive committee brought in a report recom-

James H. Beal, elected to the new joint position of editor of the proposed *Journal* and general secretary of the association.

mending among other things that the Carnegie Foundation be requested to conduct such an investigation of the pharmaceutical schools and colleges as it had made a year ago of the medical schools. At once the audience began to sit up and take notice, and everybody

apparently wondered how everybody else was going to vote on the proposition. For half an hour there was a parliamentary situation which taxed the coolness of Acting-chairman Wilbur J. Teeters. Motions to amend, to table, to postpone, and the like, followed one another in rapid succession, and there were frequent differences of opinion regarding which motion should be given preference and which was out of order. When votes were taken they were so indecisive that divisions were demanded, and then, when the roll was called, there was frequent hesitation over being put on record.

It is fair to say, however, that this uncertainty did not all result, nor perhaps much of it, from an unwillingness to be investigated. Some of the speakers conscientiously felt that the Carnegie Foundation knew nothing about pharmaceutical education and was in no position to conduct an intelligent survey. Others declared that no good would come out of such a whirlwind anyway and that colleges found wanting would still continue to do business at the same old stand. When the test vote was finally made, and the roll called, it was found that thirteen favored the investigation, while eleven opposed it. The proposition therefore carried, although the original motion was so amended by a small majority that the Conference itself will set the standards by which the investigation is to be made and upon which the results are to be judged by the Foundation. In other words, the Carnegie people will be requested in making their measurements to use the yardstick of the Conference instead of any similar instrument of their own.

DR. SCHLOTTERBECK'S SENSATIONAL CHARGE.

What lent more or less interest to this whole situation was the charge contained in the address of President Schlotterbeck, that some of the schools in the

make specific charges so that the Conference could act on them. It has a regular form of procedure for cases of this character. Dr. Schlotterbeck, it may be explained, was through illness unable to be present at the meeting. He was at the time just recovering from an operation for appendicitis.

Another declaration of President Schlotterbeck was to the effect that the use of the degrees

Prof. J. B. Schlotterbeck, whose address as president of the Conference of Faculties stirred up the animals.

Ph.D. and Ph.B. in pharmacy were fraudulent and should not longer be tolerated. This point of view was unanimously approved after some discussion. It was repeatedly declared that both degrees have a well established meaning in education, and that to use them for relatively short courses in pharmacy was entirely without excuse. It ought to be explained, however, that approval was given to the use of the degree of Doctor in Pharmacy, provided the title of "P.D." or "Phar.D." is employed, so that there would be no confusion with the well known "Ph.D."

WORK NEARLY COMPLETED ON THE N. F.

It is of considerable importance to state in connection with the Boston meeting that the revision committee of the National Formulary gathered several days before the convention opened and did a lot of good work in clearing the decks for action. Every moot question was settled, and the committee is now in position to go ahead and bring out the book. It will probably be published by or soon after January first next. It had been expected to make its appearance before this, but the difficulties of doing revision work by tedious correspondence are very great. The members of the committee seemed to feel very well satisfied with their work in Boston, and among other things it is particularly interesting to report that it was decided after a good deal of argument to retain Compound Digestive Elixir in the next revision. It will be remembered that this product has been declared to be worthless by the Council on Chemistry and Pharmacy of the American Medical Association. Practical physicians, however, still insist that the substance is really efficient and useful, and they continue to employ it liberally. The formula in the new edition of the N. F.

R. H. Walker, president-elect of the National Association of Boards of Pharmacy.

conference ought not to be there. Only twenty-five or thirty of the eighty or more institutions in the country are included in the membership, and these are supposed to be the real elect. The president asserted, however, that even some of these were at least open to question. This caused ears to be pricked somewhat, and a recommendation was adopted to ask Dr. Schlotterbeck to

will be slightly changed, however, and the dog will be given another name.

THE U. S. P.

In this connection it might be reported also that the committee of revision of the U. S. P. held one or more meetings at the Boston convention, while several of the sub-committees likewise had sessions. The revision committee is now ready, as has already been

Prof. Wm. B. Day, one of the three nominees for president.

stated, to begin rapid and continuous work on the book, since all but final decision has been reached on such articles as are to be included in the next revision.

THE SYLLABUS MOVEMENT.

One of the most promising pieces of work done under the auspicious of the A. Ph. A. is that involved in the publication of the Syllabus. As everybody knows, or ought to know by this time, the Syllabus outlines a course of study in pharmacy and allied branches which will be used by the colleges on the one hand, and on the other followed by the boards in their examinations. Thus something like uniformity and coöperation will succeed the chaos which has heretofore existed. The first edition of the Syllabus was published two or three years ago, and it is now undergoing revision by a committee of twenty-one representing the A. Ph. A., the Association of Boards, and the Conference of Faculties.

Dr. H. L. Taylor, Secretary of the Syllabus Committee, rendered reports to all three bodies in Boston, indicating among other things that twenty-five of the State boards of pharmacy throughout the country have now adopted the Syllabus in full or in part, and are using it in their examinations. Of the schools, forty-six have adopted the syllabus as far as practicable at this time, and all of these institutions are coöperating in the revision and perfection of the book. This seems to us a very good showing.

SOME CRITICISMS.

In the Section on Education and Legislation a paper was read by E. Fullerton Cook, criticizing that portion of the syllabus which outlines a course in commercial training and jurisprudence. Afterwards Dr. C. B. Lowe likewise criticized the course in physiology. It

was pointed out by Harry B. Mason, however, that these criticisms should not be misinterpreted as applying to the syllabus movement as a whole. The first edition of the book was understood by everybody concerned to be merely tentative, and it was for this reason that the Syllabus was now undergoing careful revision. The committee of twenty-one would be glad to receive the criticisms and the coöperation of any one in order to make the book more nearly perfect. Mr. Mason declared that the Syllabus movement meant a great deal towards future unification of action between the boards and colleges of the country, and in the direction of a gradual elevation of standards. Of course it was going to be difficult to get so many interests to agree upon any one course in detail, but harmony would ultimately be created out of discordance, and the movement was pregnant with good. Mr. Cook's paper was thereupon referred to the sub-committee on pharmacy of the Syllabus committee of twenty-one.

FINANCES AND MEMBERSHIP.

The Treasurer, Dr. H. M. Whelpley, was able to make a very gratifying report concerning the financial and membership situation. During the last year the permanent funds of the Association have increased by \$1069.63 and now amount to \$29,623.37. The available cash assets have increased \$1953.25 and now amount, together with the invested funds, to \$15,701.08. This makes total association assets of \$45,324.45. In addition to these figures there are special funds held in trust, and of these the Procter Monument Fund amounts to \$4478.91 and the Hallberg Memorial Fund,

John C. Wallace, chairman-elect of the Section on Education and Legislation.

raised during the last year, to \$3914.70. Respecting the latter it may be said that it was intended originally to raise \$3500 to pay off the mortgage on the Hallberg home, but since this amount has already been exceeded by \$500 or so, it is hoped that the collections may be continued until the fund amounts to \$5000.

As for the membership, Treasurer Whelpley reported that there were now 2353 active members, and

life and honorary members enough to bring the total membership up to 2490. In the meantime Chairman W. B. Day, of the general membership committee, reported that four hundred and twenty new members had been secured during the last year, at the relatively slight expense of less than two hundred dollars.

PRESIDENT EBERLE'S RECOMMENDATIONS.

President E. G. Eberle, of Dallas, Texas, made many recommendations in his annual address. Most of them were favorably acted upon by the Association. It was voted, for instance, to approve of the idea that a committee of fifty-three, one from each State and territory, be appointed to report next year on the best methods of dealing with such troublesome legislative questions as those having to do with itinerant vendors, the liquor question, artinarcotic reform, and pharmacy board examinations. This committee will also consider the advisability of having a model bill drawn up which would represent a codification of existing laws affecting pharmacists, and which among other things

C. Louis Diehl, who presided as chairman over several meetings of the Committee on the National Formulary.

would perhaps provide that the present boards of pharmacy be succeeded by commissions of pharmacy with considerably enlarged powers. A resolution was also adopted at the president's suggestion approving the present movement to so amend the food and drugs act as to bring therapeutic and curative claims within its scope. The proposition to issue a general recipe book, which has received more or less attention during the last year or two, was approved, but the idea is not to be carried out for some time. The proposition to establish a national department of health was favored, but it was suggested that pharmacy should be recognized by a bureau.

TO FEDERATE WITH THE N. A. R. D.?

Perhaps the most important of Professor Eberle's recommendations was this, that a joint committee of the A. Ph. A. and the N. A. R. D. meet to discuss the advisability of forming a federation of pharmaceutical associations, in which both the A. Ph. A. and the N. A.

R. D. should retain their separate functions, but would be joined together something like a Senate and House of Representatives, with the State associations tributary to them. This proposition was adopted, and overtures will be made to the N. A. R. D.

A NATIONAL LEGISLATIVE CONFERENCE.

An important decision was reached in providing for a national conference in legislative matters. This idea was advanced in the report of the Committee on National and State Legislation, of which Henry P. Hynson was the chairman. It is proposed to have the conference comprise five representatives each from the several national organizations in the drug trade, together with one from each of the State associations. It was a part of the original motion that the chairman of the section on education and legislation be the chairman also of the proposed conference, but at the suggestion of Dr. W. C. Anderson the selection of the officers of the conference was left to the conference itself. Where and when the conference will be held was left to the Council to decide. Such national bills will be discussed as those involving the establishment of a department of public health, amendments to the food and drugs act, patent and trade-mark legislation, anti-narcotic legislation, and the parcels post. It is probable also that State legislation will be considered. Mr. Hynson made the point that such a legislative conference ought to be undertaken under the auspices of the A. Ph. A., inasmuch as the organization represents in its membership all of the various branches of the trade. Other associations are exclusively devoted to some one branch.

JOINT CONFERENCE BETWEEN THE BOARDS AND THE COLLEGES.

It was very gratifying that a successful joint conference was held during the week between the boards and the colleges, under the auspices of the Section on Education and Legislation. Several similar attempts had been made in previous years, but they were always abortive. This year there was a pretty good attendance, and the time was taken up in discussing a model examination paper which had been prepared by a joint committee representing five board members and five teachers. A motion was made last year to have such an examination paper prepared for the guidance of the various boards of pharmacy. The discussion lasted for two or three hours, was indulged in freely by both professors and board members, and undoubtedly did a great deal of good. Of greater significance, however, was the willingness of the two bodies of men to get together and to discuss amicably subjects of mutual interest.

WORK OF THE BOARDS.

Reference has already been made to the joint conference between the boards and the colleges. It ought also to be said that the boards themselves had a very interesting convention. As usual, several sessions were held, and subjects of the utmost practical importance were discussed with great profit. The National Association has done admirable work in the unification of standards, in the perfection of examination methods, and in the interchange of certificates between the different States. At the Boston meeting 39 States in all

were represented. Of this number, 33 were active members and 6 associate members. Six State boards were added to the membership roll—Tennessee, Connecticut, Utah, Ohio, Iowa, and Wisconsin.

DR. WILEY SUPPORTED.

The present Wiley situation was mentioned on two or three occasions during the week, and was especially referred to in the address of President Eberle. At the session of the historical section, held on the boat returning from Plymouth Friday afternoon, a resolution was passed at the suggestion of Prof. J. P. Remington. This recited that the A. Ph. A. had always had for one of its primary objects the prevention of adulteration of drugs, that Dr. H. W. Wiley had been a valiant fighter for the cause, and that President Taft should sustain him in his admirable work of enforcing the food and drugs act.

THE SECTION WORK.

The usual character of good work was done in the various sections, but unfortunately we lack the space to go very much into detail. Many features of the session work of general importance, furthermore, have already been mentioned in this editorial summary of the convention, or will be referred to later on. The Historical Section, under the chairmanship of Joseph M. Lemberger, registered a departure when it held a unique meeting on board the boat Friday on the trip to Plymouth. In the evening of that day a special lecture under the auspices of the section was delivered by Dr. Edward Kremers on "The Apothecary in Literature." This was an interesting historical lecture illustrated by lantern slides.

The Section on Scientific Papers, under the chairmanship of A. H. Clark, held several interesting sessions, and a total of nearly thirty papers was presented. It is in this session that such important committee reports are rendered as those on the Drug Market, the

Chas. Caspari, Jr., who resigned the general secretaryship, and who was presented with resolutions of gratitude for his 17 years of able and faithful service.

U. S. P., Unofficial Standards, and the like. The committee on the Ebert prize awarded last year's honors to Messrs. Puckner and Warren for their paper on strychnine arsenate and copper citrate. The committee also recommended that in the future the prize be awarded on alternate years for papers in pharmacy, chemistry, pharmacognosy, and biochemical assay, one of these four divisions to be considered each year, and

in each case the contributions for the last four years to be dealt with. Under this arrangement it was thought that each branch of research would receive fairer recognition.

The Section on Practical Pharmacy and Dispensing, presided over by Louis Saalbach, was as usual the mecca for the practical pharmacists. They crowded in gratifying swarms to discuss every-day problems. One

Wm. Mittelbach, one of three nominees for president.

or two of the excellent papers read in this section we are giving space to elsewhere in this issue of the BULLETIN. Incidentally a little furor was created by the statement of Charles M. Ford, some time druggist but now drug inspector for the State of Colorado, to the effect that he made infusions of digitalis without alcohol. Several people proceeded to jump all over Brother Ford, and to declare that it was rather peculiar for a drug inspector to countenance the preparation of substances by other than official methods. Thereupon ensued a long debate as to whether alcohol was added to this product for purposes of preservation or not.

SUNDAY CLOSING.

The Section on Commercial Interests developed several discussions of practical importance. Dr. C. B. Lowe read a paper which started a debate on the question of Sunday closing. P. Henry Utech, F. H. Godbold, Charles Holzhauer, and other speakers declared that they had had the courage to close their stores on Sunday, either altogether or for a portion of the day, and that they had found nothing to be lost by it. They all echoed the sentiment that the one thing that prevented Sunday closing was the fear on the part of most druggists that their neighbors would get the business. What was needed was a little more courage and backbone. Mr. Holzhauer said that he had never opened his store on Sunday during his forty-three years of business, and he remarked that he was still on the job, while others who had pursued a different policy had come and gone.

BORROW MONEY TO MAKE MONEY!

A couple of interesting papers were read in the Commercial Section from Mr. C. Mahlon Kline and Mr. John H. Thompson on the subject of preserving the druggist's credit. This started an interesting discussion regarding the infrequency with which druggists borrowed money of their bankers in order to discount their bills and to take advantage of other cash opportunities. Mr. Kline mentioned in his paper a case where two men had started in business with about

equal opportunities. One always paid cash for his supplies even though he had to borrow the money sometimes to do it. The other disbelieved in borrowing money and fell into the habit of holding up his creditors. A financial crash came over the country, and the man who had preserved his credit by prompt payments was carried along, while the other fellow was denied supplies.

Harry B. Mason pointed out that very few druggists used their banks as they should. They did not realize that the best way to get along was to make the other fellow's money work for them. Frequently, by borrowing money at 5 per cent, one could make it earn 10 or 12 per cent and thus realize a handsome profit than on drug-store merchandise. Cash discounts alone mean from ten to fifteen per cent a year upon the money involved. Moreover, there are frequent opportunities for making large purchases at low prices, and perhaps also for making investments outside of the store. Ready money is needed, and if it is not available it should be borrowed at the bank. Several other speakers bore out this contention.

COÖPERATIVE CIGAR MANUFACTURE.

Among other papers read before the Commercial Section was one by E. Berger on "The Formation of a Coöperative Cigar Manufacturing Company." He dwelt interestingly upon the profits to be made by such an enterprise. The middleman could be cut out and a saving therefore made of from twenty-five to fifty per cent. Furthermore, a cigar could be sold for five cents which would equal the ordinary ten-cent smoke. Mr. Frank H. Freericks, the leading spirit of the American Druggists' Fire Insurance Company, spoke heartily in favor of Mr. Berger's proposition, and declared that if it were based on quality it ought certainly to succeed.

THE ELECTIONS.

Three sets of nominees were as usual selected for the general offices, the selections to be made in the usual manner by mail later on: For president, Wm. B. Day, Chas. Holzhauer, Wm. Mittelbach; for first vice-president, Jose Alacans, C. M. Ford, Otto F. Claus; second vice-president, R. H. Walker, C. A. Mayo, W. J. Teeters; third vice-president, J. O. Burge, A. H. Clark; for the council, F. C. Godbold, W. C. Alpers, Geo. B. Kaufmann, C. W. Johnson, L. E. Sayre, E. Berger, Theo. G. E. Otto, J. C. Wallace, F. W. Meissner.

H. M. Whelpley was of course re-elected treasurer and C. Louis Diehl reporter on the progress of pharmacy, both officers having their salaries increased from \$750 to \$1000 annually.

The following officers were elected in the various sections and auxiliary bodies:

Section on Practical Pharmacy and Dispensing: P. Henry Utech, chairman; W. A. Hall, secretary; and Leon A. Lascoff, associate.

Section on Commercial Interests: E. Berger, chairman; R. W. Mansauer, secretary; and B. E. Pritchard, Louis Berger, and Frank H. Carter, associates.

Section on Education and Legislation: John C. Wallace, chairman; Wilbur J. Teeters, secretary; and L. D. Havenhill, P. J. Ascher, and H. D. Kniseley, associates.

Section on Scientific Papers: W. O. Richtmann,

chairman; Chas. H. LaWall, secretary; and Frank R. Eldred, associate.

Historical Section: Otto Raubenheimer, chairman; Caswell A. Mayo, secretary; and Edward Kremers, historian.

National Association of Boards of Pharmacy: R. H. Walker, president; D. F. Davis, H. L. Hausmann, and L. C. Lewis, vice-presidents; A. H. Sala, secretary-treasurer; R. H. Walker, J. B. Bond, and C. E. Zinn, executive committee.

American Conference of Pharmaceutical Faculties: J. H. Schlotterbeck, president (re-elected); A. H. Clark, vice-president; C. W. Johnson, secretary-treasurer.

DENVER FOR NEXT YEAR.

There was an interesting situation over the selection of a place for next year's meeting. The members of the Committee on Time and Place, with Charles M. Ford as chairman, were unable to agree, and they recommended that a vote be taken on Denver, Cedar Point,

P. Henry Utech, chairman-elect of the Section on Practical Pharmacy and Dispensing.

Ohio, and Nashville. This was done on the boat going to Plymouth Friday, and it resulted in the selection of Denver by a considerable majority. Mr. Ford was himself eloquent in favor of his own town of Denver, and he caused considerable merriment, when, in responding to the official addresses of welcome at the first general session, he cleverly brought in several references to Denver, although he said he had been forbidden to mention it in his remarks.

THE ENTERTAINMENT.

The entertainment was lavish, and the hospitality bountiful. Merely to give a list of the things done would require much space. There were an alumni banquet and a smoker for the men, and auto trips, card parties, and historical excursions for the women. The *piece de resistance* was the boat trip to Plymouth on Friday, which consumed the entire day. Boston is rich in interest, and the visitors reveled in its varied charms. C. H. Packard, the local secretary, was admirably assisted by the local members and their wives, and the entertainment features were unusually successful.

SOME PHARMACEUTICAL PREPARATIONS.

Precautions to be Considered in the Manufacture of Several Syrups—A Formula for Elixir of Terpin Hydrate, Double Strength—Hints on the Preparation of Infusion of Digitalis, Tincture of Iodine, and Emulsions of Fixed Oils.

By P. HENRY UTECH, Ph.G.,
Meadville, Pa.*

For many years past we have kept a record of hints and suggestions for the improvement or expediency in the manipulation of the various pharmaceutical processes or operations which have come under our observation. I take pleasure in presenting to you at this time some of the data which, in our experience, have given excellent results. It is not claimed that these devices are all original, but were simply obtained from authentic sources, tested, tried, and not found wanting.

A BLUISH COLOR IN SYRUP DUE TO SUGAR.

I shall first call your attention to a few points, simple but very essential, in the making of U. S. P. syrups. We formerly had considerable trouble in making satisfactory syrups, both simple and medicated, until we began using the brand of sugar known as "Crystal A" Confectioner's Sugar. This particular brand seems to be entirely free from the bluish coloring principle. The water, too, must be distilled, not sterilized, if you expect to make a perfect product.

LIGHT DETRIMENTAL.

We also experienced some difficulty in maintaining a satisfactory syrup of wild cherry. Inasmuch as the influence of light exercises a very detrimental influence on the keeping quality and remedial value of this syrup, we have found it quite advantageous to keep the stock syrup in an amber-colored glass container. Some authorities claim that the aromatic principle is entirely dissipated in a few months upon exposure to direct light. Incidentally I might mention that such clinical authorities as Wood, Sollman, Wilcox, and others are convinced that this preparation is used chiefly for a flavor and contains little, if any, therapeutic property.

The compound syrup of hypophosphites formerly gave us some difficulty in making a

permanently clear product owing to the presence of a basic calcium salt. The addition of a small quantity of hypophosphorous acid seemed to remedy the trouble.

ELIXIR OF TERPIN HYDRATE, DOUBLE STRENGTH.

An elixir of terpin hydrate containing twice the usual amount of the terpin hydrate can be prepared by the addition of a small quantity of acetic acid. The formula we now use is as follows:

Terpin hydrate, in powder.....	256 grains.
Acetic acid.....	80 minims.
Tincture of sweet orange peel	2 fluidrachms.
Alcohol.....	8 fluidounces.
Glycerin.....	4 fluidounces.
Elixir aromatic, q. s. to make	16 fluidounces.

Dissolve the terpin hydrate by the aid of a gentle heat in the alcohol, to which the acetic acid has previously been added. Then add the tincture of sweet orange peel, glycerin, and lastly, elixir sufficient to make 16 fluidounces.

Most formulas suggested by other experimenters seem to be heavily charged with glycerin in place of the alcohol, in many instances making the preparation eligible to the class of glycerites. Many also suggest the use of saccharin as a sweetening agent, which has recently been tabooed by the pure food and drug authorities.

We also make the elixir aromatic by using only one-half the quantity of syrup and water called for, in the first part of the operation, mixing with the spirit of orange and alcohol, and filtering until a clear solution is obtained. By this operation there is an economy of several hours' time.

INFUSION OF DIGITALIS.

When dispensing the U. S. P. infusion of digitalis, the physician expects to get a preparation which represents the entire diuretic property of the drug. For this reason we have always employed the well-known English brand of the drug. Although costing more

*Paper read before the Section on Practical Pharmacy and Dispensing of the A. Ph. A. last month in Boston.

than double the price of the American-grown drug, there is no comparison in the quality of the finished preparation.

This idea of economy is of altogether too frequent occurrence among our pharmacists. Many of the newer U. S. P. and N. F. formulas contain numerous volatile or aromatic substances, in some instances as an adjuvant, in others because of some therapeutic value. It is possible that often their object is entirely defeated through the dispensing of an inferior product. Take the case of the liquor antisepticus, tincture of lavender compound, etc., as examples. Their medical properties depend entirely upon the volatile oils. Many of our more progressive wholesale drug firms now attach a label showing the physical constants of each oil, thereby insuring uniformity and accuracy in the finished preparations in which they are employed.

We prepare several aromatic medicated waters by simple agitation of the oil with hot water, allowing the fluid to stand for several days or weeks as the case may be. The product is then poured upon a wet filter which retains the excess of oil, and the preparation is then ready for use.

TINCTURE OF IODINE.

For more than ten years we have used the circulatory displacement method in preparing tincture of iodine with most happy results. The U. S. P. 1890 formula calls for potassium iodide in addition, which is not immediately dissolved. We use about 90 per cent of the alcohol at first, place the mixed chemicals in a muslin bag and suspend them for one-half hour in the liquid. After that we take any excess of potassium salt out of the bag, add it to the tincture thus prepared, and finally wash the bag with the remainder of the alcohol.

CASTILE SOAP FOR EMULSIFICATION.

In making up emulsions of fixed oils, such as castor, almond, cottonseed, etc., the addition of powdered Castile soap—about 1 gramme to each 30 Cc. of oil—makes a most excellent emulsifying agent. In the case of castor oil emulsion, the soap likewise increases the aperient action of the oil. The soap may also be used in preparing emulsions of balsam of copaiba by increasing the amount with very satisfactory results. Emulsions of this character, however, are not as permanent as those made with gum arabic.

A NOTE ON CAPSICUMS.*

By WILBUR L. SCOVILLE.

For many years pharmacists have appreciated the fact that different varieties of ginger vary in pungency and flavor, but that capsicums vary in the same way and to a much greater extent seems to have escaped attention.

The pungent principle of capsicum is capsaicin, a crystalline body which E. K. Nelson says¹ is so hot that one drop of a solution 1 in 1,000,000—or less than one millionth of a grain—will make itself known to the tongue. He found one variety of capsicum to contain 0.14 per cent of this principle.

H. C. Irish, in a "Revision of the Genus Capsicum,"² describes 42 garden varieties and quotes authorities for the statement that the

different varieties readily degenerate or change under cultivation or the lack of it. Hence the pungency of capsicum varies not only with the species, but with variations in growth or cultivation. Paprika, one of the mildest forms, has been grown quite free from capsicum—in short, it is non-peppery pepper.

And while tabasco by another name might be quite as hot, yet the tabasco species may not always come up to its reputation!

In other words, the pharmacist cannot, by specifying a certain species of capsicum, be sure thereby of securing the most active medicinally. The best method of selection appears to be the physiological test, which will be referred to again below.

In commerce the greater demand for capsicum is as a condiment, and for the preparation of sauces, pickles, etc. In these a full, rich flavor is desired, as well as pungency.

*Read at the Boston meeting of the American Pharmaceutical Association last month.

¹*Journal Ind. and Eng. Chem.*, 1910, p. 419.

²*Report Mo. Bot. Gardens*, 1898, p. 53.

Supplies for such purposes are marketed as "Japan Chillies," "Zanzibar Chillies," and "Mombassa Chillies." Doubtless there are other brands, but these appear to be the leading ones. A limited number of tests of these three brands show that Japan Chillies have a rich and full flavor, but are not very pungent, as compared to the others. They command a higher price, and make a superior condiment. Zanzibar Chillies came next in pungency and flavor, while Mombassa Chillies are the most pungent and the poorest in flavor.

Physiological tests are tabooed in some quarters, yet when the tongue is sensitive to less than a millionth of a grain it certainly has an advantage over the analytical balance, which has a sensitiveness far below that; and since it is not necessary to compare different capsicums in terms of percentage of capsicum, when a direct ratio of drug to drug expresses all that is needed, the physiological test offers here a ready and satisfactory means of selecting capsicum.

The method I have used is as follows: One grain of ground capsicum is macerated over night in 100 Cc. of alcohol, and after thorough shaking, filtered. This alcoholic solution is then added to sweetened water in definite proportions until a distinct but weak pungency is perceptible on the tongue.

By this method, Japan Chillies tested 1 in 20,000 to 1 in 30,000, Zanzibar Chillies 1 in 40,000 and 1 in 45,000 (two lots), and Mombassa Chillies 1 in 50,000 to 1 in 100,000. From a limited number of tests the Mombassa brand appears to be decidedly stronger in capsicum. We have not had it under observation long enough to decide on a limit of acceptability that will represent the average of the drug, but there appears to be no trouble in obtaining it of a strength of 1 in 50,000 or above.

Oleoresin of capsicum may test 1 in 150,000 and upwards. When used as a rubefacient, flavor is of no consequence, but a high capsicum content is desirable.

It may be of interest to state that commercial capsicums vary also in fat-content and color to a marked degree. Oleoresins were examined which contained as little as 5 per cent of fat insoluble in alcohol, while others contained above 50 per cent, yet the more pungent oleoresins (based on the entire mixture) were those containing considerable fat. The fat in some instances was a marked green, quite free from red; in others it was orange, and in still others a deep red, and no relation of color or fat to pungency could be observed.

Laboratory of Parke, Davis & Co., Detroit.

PHARMACEUTICAL WINDOW DISPLAYS.

Not so Difficult as One May Imagine—Several Ideas for Such Trims—Manufacturing Processes that Will Interest the Public—Utensils, Medicinal Plants, and Crude Drugs Available for Exhibition—The Returns from Windows of a Purely Technical Nature.

**By OTTO RAUBENHEIMER,
Brooklyn, N. Y.***

For the pharmacist, who is somewhat ingenious and practical, there are several ways of making window displays of a strictly pharmaceutical character. The various pharmaceutical processes can be utilized:

SEVERAL PROCESSES.

Filtration.—This simple process can be made quite an attraction if carried on in the show window. Water colored blue with a

little ultramarine can be filtered clear and is a strange phenomenon to the average public. And still more so is the coloration of water tinted with an aniline dye and filtered through kaolin.

Continuous filtration, or one lasting quite a long time, can be easily arranged by an inverted large bottle, *e. g.*, a five-gallon bottle over a large filter. To prevent any splashing the bottle should be fitted with a stopper and one or two pieces of glass tubing.

Percolation, especially if a bottle containing

*Read before the Section on Commercial Interests of the A. Ph. A. last month in Boston.

the colorless menstruum is inverted over the percolator, has proved quite an attraction in my window. The highly colored percolate, dropping at regular intervals, arouses the curiosity of the public.

Distillation.—The process carried on in the show window will give that pharmacy a professional and scientific look. A Remington still can be used for the distillation of water and also for the recovery of alcohol from the marc left after percolation. If a glass retort is used, the difference between the colored liquid to be distilled and the colorless distillate will be a mystery to the average public.

I have found an upright or reflex condenser attached to a large flask quite an attraction. This method of distillation has the great advantage of taking care of itself without any constant watching.

Precipitation.—This process can be utilized in the manufacture of milk of magnesia by filtering the solution of magnesium sulphate into the solution of sodium hydroxide contained in a large and tall bottle. The magnesium solution being heavier in gravity sinks to the bottom, forming magnesium hydroxide on its way.

Washing, decanting and siphoning can be demonstrated in the manufacture of the same preparation.

GLASSWARE AND APPARATUS AVAILABLE.

Laboratory ware displayed in the show window is one of the best attractions. The variety is so large that there is no trouble in making a selection. I mention the following: Funnels and percolators displayed on stands, percolator jars, tincture press, drug mill and sieves, water-bath and evaporating dishes of glass and porcelain, precipitating jar, stirring rods, etc.

Chemical glassware makes a still more scientific display, a display which gives the public the impression that this pharmacist belongs to a higher class. The following can be displayed to great advantage: Retorts, condenser and receiver, different styles of flasks, including volumetric flasks, pipettes and burettes with stand, wash bottle, drying jar, beakers, test tubes on the rack, hydrometers in jar, specific gravity bottle, and even the blowpipe.

Prescription utensils constitute a very appropriate window display which will impress the laity and also the medical profession, and

which will thus help to increase the prescription business. The following might be displayed: Different sizes of mortars and pestles of Wedgwood, porcelain, and glass, graduates holding from minims to a quart, even a prescription balance, pill machine, porcelain tile, tablet and tablet triturate machines, suppository machine and molds, infusion jar, spatulas, an assortment of pill and powder boxes, different sizes of ointment and other jars, and a row of prescription bottles, holding from one drachm up to a pint or a quart.

LITERATURE ON DISPLAY.

Prescription books and files, especially if you have an old-established pharmacy, always make an interesting window display. At the same time a sign may state the number of prescriptions compounded during a month or year or during the entire existence of the store.

While on the subject of books I will also mention a literary display, for example, some of the pharmaceutical journals which I read, or some of the books on pharmacy, chemistry, botany, materia medica, etc., in my library; or some of the Pharmacopœias and Formularies I am acquainted with.

Such a display, especially if it includes some foreign journals and books, will undoubtedly raise you in the opinion of the public above the level of the ordinary druggist. Along the same line it is well to occasionally make a window display of your college diplomas, your licenses, and your certificates of membership in different pharmaceutical associations. An odd display of that sort will interest the public and will benefit your business without any doubt.

MEDICINAL PLANTS.

One of the most interesting displays is one of living plants in the show window. It is not necessary to be an expert botanist to go out in the fields, or even in the city limits, to gather a great many medicinal plants. The writer has done so on numerous occasions. I mention the display of digitalis in bloom, together with historical facts, from its introduction into medicine as a diuretic by the English physician, leading up to the discovery of its glucosides and the application of biological standardization.

A blooming larkspur plant, *Delphinium Consolida*, with its blue dolphin-shaped flow-

ers, whence its name, has proved quite an attraction. Furthermore it has greatly helped the sale of tincture of larkspur.

Conium, the poison or spotted hemlock, with a bit of its history as being used by the old Greeks to execute their criminals, and as being the plant from which the drink was prepared to poison Socrates, has proved an interesting window display. A jar of poisonous conium seed next to a jar of harmless anise seed, together with a proper explanation of the danger of confusion, will have the beneficial effect that the laity will patronize the educated pharmacist in whom they have confidence.

CRUDE DRUGS.

Drug Display.—Above all a druggist or pharmacist should occasionally make a display of drugs, including drugs in their crude state, in his show windows. Flowers, herbs, barks, roots, seeds, etc., displayed in boxes and jars, of course properly labeled, make an interesting as well as an educational window display. If neatly written or printed signs with further explanation and a bit of history accompany this display, it will arouse still more attention.

I might also call your attention to the fact that at least one pharmaceutical manufacturing house in connection with its assayed preparations has placed in the hands of the pharmacists a set of drugs in glass-stoppered bottles with neat celluloid labels giving synonyms, definition, habitat, history, etc.

Besides these the pharmacist should make window displays of vanilla beans in jars, or rhubarb in the root or in fingers, cubes, and powder, of boxes of chamomile flowers, of tins of insect powder, or bars and pieces of Castile soap, sticks of extract of licorice. During the Hudson-Fulton celebration in New York City (August 25 to October 3, 1909) I made a cinchona window display, which was also exhibited at the October pharmaceutical meeting of the Philadelphia College of Pharmacy. This pharmaceutical window display is described in the *American Journal of Pharmacy* of November, 1909, pp. 534-536, and was even abstracted in the *Mittheilungen zur Geschichte der Medizin und der Naturwissenschaften*, Bd. ix, Heft 3, p. 325, published by Leopold Voss, Hamburg. I could continue to enumerate displays of chemicals, indicating that you keep a full stock of same, of various preparations, of specialties and of seasonable

articles, but too much time has already been occupied.

CHEMICALS OF HISTORICAL INTEREST.

Before closing, however, I want to call your attention to two facts, namely:

1. *Historical knowledge*, as to the origin of drugs, the etymology of their names and their history, is of great benefit in the practice of pharmacy and also in pharmaceutical window displays. Such a simple display as sulphur, Rochelle salt, and cream of tartar lozenges can be made highly interesting and educational by displaying at the same time jars of these chemicals together with placards of their history.

THE RETURNS.

2. *Dollars and Cents in Window Displays.*—From a pecuniary standpoint these displays should also be profitable. In this age of commercialism even the pharmaceutical window displays have to produce hard cash. That such can be done I have fully demonstrated to my own satisfaction. The display just mentioned of sulphur, Rochelle salt, and cream of tartar lozenges greatly interested the laity, who willingly and rapidly bought these at 10 cents per box, while my nearest competitor offered sulphur and cream of tartar lozenges at 5 cents a box.

Through the display of chemical glassware the students of the high school bought their flasks, glass and rubber tubing, and also chemicals at my store, and also remembered me when their families were in need of any drugs, prescriptions, etc.

The display of the flowering larkspur plant, together with jars of the whole and ground seed and the finished tincture, has greatly helped the sale of the drug as well as the preparation. A neat show-card in your window announcing that you keep a complete line of chemicals and reagents will bring to your store students, amateur and professional photographers, and physicians for their supplies and other goods.

The subject of window displays is most certainly an important one. In fact, one of our bright pharmaceutical editors has even written a book on "Window Displays for Druggists," of which two editions have so far been published.

I trust that my suggestions for pharmaceutical window displays will be somewhat con-

sidered and will have the desired effect, namely, that more displays will be made pertaining to pharmacy, displays that will gain the con-

fidence of the public and the physicians, displays that will be a credit to the profession of pharmacy.

A NEW METHOD OF MAKING TINCTURE OF OPIUM.

A Process Based Entirely on Maceration—Has Several Advantages Over the Old Way—Exhausts the Drug while Saving Time and Menstruum.

**By WILLIAM R. WHITE,
Nashville, Tenn.***

Tincture of opium, which is undoubtedly the most important preparation in the Pharmacopœia, has been the subject of much study and investigation. Many methods have been devised for its manufacture, the majority of which have involved both the principle of maceration and percolation. The chief feature of this method, however, is that it is based entirely on the principle of maceration. There are three points in which the writer claims it has an advantage over the U. S. P. method:

1. It entirely exhausts the opium.
2. It avoids the slow process of percolation.
3. It recovers a part of the menstruum left in the mass.

The process is as follows:

Take 100 grammes of U. S. P. granulated opium and add to it 500 Cc. of boiling water, macerate for forty-eight hours with occasional stirring, add 500 Cc. of alcohol, macerate again for forty-eight hours with occasional agitation, allow the drug to precipitate, decant the clear supernatant liquid, place the residue on a filter and allow the menstruum to filter until it ceases to drop, then place the filter and contents in a tincture press and express as much as possible, add the filtrate to that portion decanted, measure the whole, noting the difference between that obtained and the 1000 Cc. first used. The marc is then exhausted with hot water by adding about 80 Cc. at a time, allowing it to macerate a few hours, then expressing it. This operation is repeated until the opium is exhausted, which can be ascertained by testing the filtrate with the general alkaloidal reagents. The combined ex-

tractions are then evaporated on a water-bath until the volume is equal to one-half the difference noted above. This is then mixed with an equal volume of alcohol and added to the measured filtrates. The whole tincture is then filtered, and is ready for use.

If a press is not available, the same results can be obtained in the exhaustion of the drug with the hot water by repeatedly macerating and filtering instead of expressing, except that all of the alcohol left in the marc will be lost by the subsequent evaporation.

About 400 Cc. of hot water has usually been found sufficient to complete the exhaustion. Some samples of opium, however, seem harder than others to exhaust. The principal objection to this method is the time that is required in evaporation. This is to a large extent under the control of the operator and can be hastened when desired by using a greater number of evaporating dishes or by evaporating *in vacuo*.

There seems to be no longer any dispute over the question whether water will exhaust opium of its morphine, since the U. S. P. has relied upon this fact in its directions for making the deodorized tincture opium, also in the extraction of the opium in assay process.

In 1902, Dr. E. A. Ruddiman published an article in the BULLETIN OF PHARMACY, vol. xvi, p. 368, in which he claimed that the opium was not entirely exhausted by the dilute alcohol used in the 1890 U. S. P. process.

In 1906, H. A. B. Dunning, in a paper read before the A. Ph. A., stated that it had been proved by assay that neither the old nor the new U. S. P. method for making tincture of opium exhausts the opium completely. After repeatedly assaying the tincture made by the

*Read before the Section of Practical Pharmacy and Dispensing of the A. Ph. A. at the Boston meeting in August.

above method, I can state that my results have proved conclusively that this method does completely exhaust the opium of its morphine.

The saving in alcohol by using this method is quite an item in the cost of the tincture, especially where large quantities are made at a time.

In conclusion, I will state that this method has been in constant use by one firm for fifteen years with the most favorable results, and it is my firm belief that the practicability of this method will appeal especially to those pharmacists who are not prepared to assay their finished tincture.

U. S. P. ADMISSIONS AND DELETIONS.

The Executive Committee of Revision has Decided what Old Articles to Drop and what New Ones to Admit—Both Lists are Here Printed for the Information of BULLETIN Readers.

[NOTE BY THE EDITOR.—For over a year now the Sub-committee on Scope of the General Committee of Revision has been discussing what drugs, preparations, and substances shall be represented in the forthcoming ninth revision of the U. S. P. Decision has now been reached on all but a few articles, and the lists of admissions and deletions were made public by Chairman Remington at the Boston meeting of the A. Ph. A. last month. These two lists have had the approval of the members of the Executive Committee of Revision, and everything is now in readiness to go ahead with the actual work of revising the texts for the articles decided upon for recognition.]

NEW ARTICLES FOR ADMISSION.

THE IMPORTANCE OF DISCOUNTING BILLS.

Five Druggists Express Their Views and Relate Their Experiences—All Agree that the Practice Pays Handsomely—Some Prove it Arithmetically.

Notwithstanding the movement agitated in the pharmaceutical conventions and journals to make the practice of discounting bills universal in the drug business, there are still a large percentage of proprietors who fail to avail themselves of cash discounts. In this symposium several druggists who have been wise enough to see the advantages of the system and profit by it have come forth with the figures that prove the wisdom of their action. The savings which they have been able to effect are very conclusive object-lessons in themselves.—THE EDITORS.

EDGAR F. HEFFNER,

Lock Haven, Pa.

One cent out of every dollar rung up on our cash register during 1910 was added to our profits because we discounted our bills.

In the ten years our firm has existed we have doubled our stock and our yearly business. This expansion combined with heavy

Edgar F. Heffner.

purchases a number of times put us up against the proposition of having bills come due without the money to pay them, and take the discount.

DISCOUNTING BILLS WITH BORROWED MONEY.

As we started with a strong determination to discount all bills we felt no hesitancy about going to the banks for accommodation, and a simple explanation as to the reason why was all that was necessary to secure the desired loans without hunting for an indorser.

Our books show that the interest on these temporary loans amounted to \$92.50, and also that our discounts during this ten-year period amounted to \$2646.26.

Our bills subject to discount for 1910 amounted to \$15,126.54, and the discounts to \$301.26, or approximately 2 per cent. The rate of discount generally varies from $\frac{1}{2}$ per cent for heavy chemicals, etc., 1 to 2 per cent in ten days from the jobbers, to 5 per cent for specialties and sundries in which the manufacturer's margin of profit is greater. But in any well-balanced business cash discounts will average about 2 per cent in ten days with thirty days net.

A deduction of 2 per cent from a bill for anticipating payment twenty days really figures about 38 per cent yearly interest on the money, so that any solvent business can afford to borrow the money needed temporarily at 6 per cent rather than lose the discounts.

BETTERS THE MORALE OF A STORE.

Meeting financial obligations promptly and taking advantage of every cash discount is in addition the best evidence any individual or firm can give as to the successful management of his or their business.

It has been quite a surprise to find that many firms who are financially able to discount their bills do not do it. Investigation of credit men has shown that druggists are more careless about taking their discounts than are other merchants.

That this has not disabused the minds of the general public as to the immense profits in the drug business is a source of wonder, as "the man who discounts his bills" is rightly considered to be the one who is making and keeping a good profitable business.

A reputation for being slow or poor pay will endanger the success of any business for the reason that the slow one is passed up by the manufacturer or jobber when any good

propositions are put out. He is made to pay the highest price and is naturally the prey of the sharks with doubtful ventures who would hesitate to tackle a wide-awake merchant.

Beside that, the slow-pay merchant cannot hold the confidence of the general public, who soon learn his credit rating. They reason that he doesn't pay his bills because he doesn't do enough business, and it is a well-demonstrated fact that every one likes to buy from a successful, prosperous, going concern.

Finally the subconscious effect of regularly discounting one's bills will be to stiffen his backbone, raise his self-esteem, and make him a better, more methodical business man.

E. E. CALKINS,

Ann Arbor, Mich.

I discount practically all my bills. The rate is from 1 per cent on drug jobbers' invoices to 5 per cent on a few items. It averages probably between 1 and 2 per cent.

I keep no discount account, merely charging to the merchandise account the net amount of my remittance.

The discount amounts to so much more than interest that a druggist can make a good profit on borrowed money in discounting his bills. He can borrow at 6 per cent and save 18 per cent on a thirty-day 1-per-cent invoice. He has ten days to take his discount, which therefore amounts to 1 per cent for twenty days, or 18 per cent per year. He can borrow at 6 per cent on short-time notes, making a profit of 200 per cent on the interest he pays.

What I cannot understand is why some firms refuse to take local checks, either on discounted bills or mature ones, but will wait an extra thirty days and then make draft and pay the exchange themselves.

CLARENCE O. BIGELOW,

New York.

We discount about 75 per cent of our bills, the other 25 per cent being net thirty days, and not subject to discount.

Our cash discounts on different lines are as follows: On drugs and chemicals we get 1 per cent off in ten days; on proprietaries from 1 to 5 per cent in ten days; on sundries, purchased from jobbers, 1 per cent in ten days; on sundries, purchased direct, 2 to 5 per cent in ten days.

The annual saving effected in this way is considerable. Our cash discounts approximate about two-thirds of our office expenses, and we employ two bookkeepers.

It is worth while for a druggist to avail himself of all cash discounts even if he has to borrow the money and pay interest on it. But why borrow the money? The bank's help may be necessary at the outset, but when profits are reinvested in the business, borrowing for discount purposes should cease, except

Clarence O. Bigelow.

upon rare occasions. This, of course, applies only to those lines of merchandise where monthly purchases vary little throughout the year, and not to those branches of trade having their busy seasons, when extraordinary purchases are necessary.

By husbanding his resources a pharmacist should soon have ample capital with which to do business, and thereby enable him to make purchases in larger quantities, discount bills, and promptly meet every ordinary business obligation.

GRANT W. STEVENS,

Detroit, Mich.

I discount all bills that carry any cash discounts, even the Standard Oil Co.'s, which are only one-half of one per cent.

I pay all city bills on the 10th of each month, excepting the wholesale drug houses, to whom I remit on the 5th and 20th respectively.

Upon about 10 per cent of our purchases there is no discount as such: the goods are candies, chewing gums, sundries, etc., which are bought from pedlers for spot cash.

Upon about 35 per cent of our purchases there is a 1-per-cent cash discount, which ap-

Grant W. Stevens.

plies to purchases of drugs from the wholesale houses and a few of the manufacturers.

Upon about 50 per cent of our transactions there is a 2-per-cent cash discount, which applies to pharmaceuticals, sundries, cigars, and similar things.

Upon 5 per cent of our purchases there is from 3- to 5-per-cent cash discount. This applies to wines, liquors, etc.

In 1910 our discounts amounted to approximately \$186, irrespective of our saving in trade discounts for quantity and job-lot purchases.

I have never availed myself of the opportunities to be gained by the use of borrowed capital, but highly appreciate the value of such accommodations if they are used conservatively.

C. H. McCONNELL,

President Economical Drug Co., Chicago, Illinois.

We discount all our bills. We even pay in ten days bills that are not due until thirty days, without discount. This we do for the purpose of strengthening our credit, if it needs strengthening, which we doubt; but we hate to have unpaid bills on our files.

It is difficult to say how much, expressed in percentages, we save by discounting. Cash discounts range from 1 and 2 to 5 per cent. At a rough guess they average $2\frac{1}{2}$ per cent. This, on the \$206,703 worth of goods we bought last year, would amount to something over \$5000, and would pay the salaries of five clerks at \$1000 a year.

As for the amount of money we save by taking advantage of cash discounts, we are scarcely able to say for want of records. We eliminate red tape as far as possible in keeping statistics of our business, and it is of no interest to us to know what kind of goods we are selling. We simply have two headings—prescriptions for one, and all the rest for the other.

I know of drug stores not doing one-half the business of the Economical that give employment to two, three, or even four men in their accounting department to figure out percentages of sales in every conceivable way. We asked them what good it would do to know how much or how little they sold of various patent medicines, and they had to admit it would do no actual good, but that they "kind of wanted to know."

The office work of this vast business is done

Chas. H. McConnell.

by myself, in a supervisory way, which is as little as I possibly can get along with, and by Mr. Naylor, secretary and treasurer, who runs the cash, bank accounts, bookkeeping, and is stenographer, with the help of an assistant four or five hours a day figuring up bills. He could not attend to so much if I did not eliminate red tape in dictation. My letters are short and to the point, and don't keep him one-half hour a day, on the average.

THE DRUGGIST AS A BUYER.

A Paper of Great Practical Usefulness by One of the Largest Retail Buyers in the West,
the Senior Partner of a Drug Firm Operating Eight or Nine Stores.

By CHAS. R. SHERMAN,*
President of the Sherman-McConnell Drug Co., Omaha, Neb.

The buying of goods involves, first of all, a knowledge of what may be *sold* with advantage. This advantage may be a short or a long profit, and the returns may be computable in either dollars or customers.

FOUR POINTS.

The whole subject may be classified somewhat under the headings of:

1. What to buy.
2. When to buy.
3. Where to buy.
4. How much to buy.

Each of these propositions, however, is dependent, in a measure, upon one or all of the others.

"What to buy," for the man in the large city store, may be something entirely different from the article required by the dealer in the smaller town. Here the knowledge of the buyer and the seller must be combined.

PARIS GREEN AS AN EXAMPLE.

It is springtime and the manufacturers and dealers are sending out notices regarding the subject of "Paris Green." Ninety-nine per cent of all that is sold of this article in drug stores is disposed of during the space of one calendar month, and here indeed, in this one item, is a subject not meaning much in dollars and cents, yet involving a careful knowledge of the rules of buying and selling with the element of chance or "trade wind" thrown in.

A certain dealer may be located in a place where the nearest hill of potatoes is 50 or 100 miles distant, and the subject is therefore of absolutely no interest at all.

Another one is an agricultural country where "Murphies" are raised in abundance, but he has never noticed much demand for Paris green, or, indeed, for any other insecticides. This fellow has been asleep and has let the business drift into other channels.

*Read before the Nebraska State Pharmaceutical Association and specially contributed to the BULLETIN OF PHARMACY.

The live dealer and the careful, competent, and courageous buyer will carefully estimate his probable demand for Paris green and get the best possible price for it. If it is a good year for this article, he has the satisfaction of being able to supply all demands at best current prices, and reaping the profit that belongs to the business.

If, however, he has been improvident in looking after this item until the season is well upon him, he will probably miss a large part of the business and will greatly annoy his prospective customers by not being in position to supply the article when wanted. If supplies are obtained from a distant market, it will be too late and the other fellow will have had the business.

A too niggardly policy in estimating one's wants will bring about the same results. Of course, a "bad year," which on this item means a year in which Paris green is not needed by potato raisers, will leave the plentiful buyer with some stock to carry over till the next year, but since Paris green is a staple product, this is only one of the trade hazards that should be bravely faced by a druggist who wishes to be really in the game.

ANTICIPATING DEMAND FOR SEASONABLE GOODS.

Each month and week in the year brings its procession of items that have a more or less active interest to the buyer and seller for a long or short season only.

Moth balls and moth-proof bags, fly-paper, root beer, ginger ale, mineral water, not forgetting our old friend sassafras—each has its season when it may be termed the central figure in the little drama of commerce being enacted in every drug store.

To remember these facts is of primary importance to the buyer in guiding him toward proper, timely and adequate purchases.

The pop-corn, peanut and red lemonade stands would be melancholy spectacles on the

day after the circus, but in the midst of the "greatest show on earth," with its throng of interested pleasure seekers, each one of these venders is a merchant of the most approved type, but each is wise enough to move on with the show, and experience has taught him to stock up *the day before* the performance.

It will be seen that the foregoing remarks relate to both the subjects of "What to buy" and "When to buy," for one of these subjects cannot be separated from the other.

"Where to buy" and "How much to buy" are equally inseparable subjects. It is absurd for any one to lay down an absolute rule for the guidance of all dealers, as the varying conditions of each establishment, large or small, must be the factors to guide and control this matter wisely.

LEARN A LESSON FROM THE POP-CORN MAN!

We can learn much from the pop-corn and peanut men, who carefully make their purchases in *advance*, prepare their wares for rapid sale, and in most instances really seem anxious to sell something that will please the patron.

The pop-corn business has perhaps no rival except that of the peanut vender, as an ideal commercial project. Here the bugbears of "dead" stock, "out-of-date" stock, "large" or "small" sizes, and "seasonable demand," are all reduced to a minimum. It is only a question of getting *plenty of buyers for pop-corn and peanuts*. For this reason, in order to make the business an attractive one, the atmosphere of the circus and the busy street corner, with their throngs, is absolutely necessary.

Unfortunately the dealer in staple lines must figure on an entirely different basis than do the itinerants we have mentioned. The problem of buying therefore becomes much more complex and requires the greatest nicety of actual knowledge, as to just the articles needed and how much of each—and this of course involves the important question of the source of supply.

One may hear, through the channels of gossip in the trade, a great deal about "good buyers," "sharp buyers," "close buyers," "reckless buyers," and "inside buyers," but the whole subject of successful buying, like any other connected with business, must be largely dependent upon a *knowledge of what is*

wanted, and the requisite *care* to see that one gets it.

AS TO WANT-BOOKS.

The buyer must, in some manner, carefully collect data for reference. Possibly the first record needed is that showing *what* is wanted. This is represented by the general "want-book," which of course means any kind of a book or slip where may be written the name of the article needed. The time to find out when this article is needed has been hinted at already, but inevitably the moment comes when the customer asks for the article you *do not have* in stock, and then is the moment when this article must imperatively be put down in your want-book. An indexed want-book with special pages for firms of whom frequent purchases are made is the best way not to overlook items needed of regular stock. The article asked for that you do not have in stock may be so *new* or so *rare* or so *obsolete* as to not justify carrying it, but this consideration must be carefully weighed with reference to each item, for here are the *nascent atoms that make the molecules that make the mass that makes your business*.

Disregard the individual demand of the customer of the hour and you have blighted the germ of business growth! The buyer in most establishments is the one in position to nurture this germ, and perhaps develop from the smallest beginning a tree that will furnish fruit and shade in times of commercial hunger and drought.

DON'T IGNORE THE SINGLE CALLS FOR NEW THINGS!

There is no more interesting phase of business than that of watching the growth in sale of a single item originally stocked from a single call. At the present moment I recall two articles, one of them a rheumatism remedy, the other a cleaner for clothes, one selling for 75 cents and the other for 25 cents, one manufactured in one of the busy towns of a seaboard, trust-ridden commonwealth, the other in the commercial and esthetic hub of the Bay State and the universe, where all preparations for taking out spots, literal and figurative, should probably be made.

The almost sporadic call for the rheumatism remedy, by receiving requisite attention to the end that the article should be supplied to the prospective customer, was the beginning

of quite a flourishing business on this one item." The same result obtained in the case of the clothes cleaner. One of these articles is now purchased in 1-gross, and the other as high as 5-gross, quantities. The original purchase of each item was *one bottle* only, sent direct from the manufacturers to ourselves, because we could not obtain it through any western jobber. In the instance of the first purchase of each of these articles, it was necessary to ask the customer to bear a portion of the expense of obtaining the items in addition to the value of the goods.

It should also be stated that the *growth* in sale of these items has been produced from causes *outside* of our store, not from within; therefore showing that these transactions were profitable once to our house as new business and new customers were attracted that probably would not have been obtained without the presence of these items in our stock.

THE MOOT QUESTION OF "OVERSTOCKING."

The one mooted question in buying is that of overstocking, and while much loss is occasioned on this account, still I am bound to hold fast to an opinion which crystallized into an absolute conviction some years ago, namely, that *there is much more loss occasioned from understocking than from overstocking.*

This should not be taken as an injunction to general, reckless buying in quantities as large as the seller wishes the purchaser to buy, yet the system of niggardly under-buying has starved many a business man to death, and one cannot but remember the experience of the economical muleteer who finally had succeeded in teaching the mule to live without feed, when it "up and died."

The man who buys 1/12 or 1/4 dozen of an article of which he could have easily used 1 dozen, has made his chances of being found without goods 12 or 4 times as great as would have been the case had he purchased in a reasonably decent quantity.

"THE SMART UNDER-BUYER."

The smart *under-buyer* will tell you that "You can always buy more goods," which of course is true, but between each purchase there is the *dangerous interim* when you may be out of stock, or you may not think to put the article down in the want-book until a sale has been lost.

Where goods are obtained from some little distance, the obstacles to obtaining stock become greater, and the necessity for properly estimating the amount of stock needed is more apparent.

Even in the cities, where supplies may be obtained by messenger during any business hour in the day, a considerable business may slip through one's hands, simply because the customer will not wait for the slothful business man to put in stock the article that his neighbor, who is more vigilant, has at hand all ready to be wrapped up.

Again, no source of supply is unfailing, and some of the most staple articles are frequently not to be obtained from your jobbing house. Therefore the more necessity for placing in stock at the time each purchase is made a quantity that will be thoroughly commensurate with the demand.

A STRIKING EXAMPLE TO AVOID.

I well remember a druggist of the old school who was, at one time, doing reasonably well, and for whom I worked some little time during my early years in the business. This man seemed every day to be in doubt whether the regular staple articles upon his shelves would continue to be in demand after his present supply was exhausted. The result was that, before another purchase was made, he would actually allow a customer or two to call for a staple article after the stock had been exhausted, seemingly needing to have his commercial courage braced up each time for the ordeal of venturing the purchase of another 1/4 or 1/2 dozen of a staple article!

Though but a boy at the time, it was absolutely depressing to my commercial nervous organization to see business thus frittered away. This man, by force of frugal habits and small personal store expenses, as well as having a fairly good neighborhood location at the time, was in what seemed, from his standpoint, thrifty circumstances, but his absolutely wrong system of supplying stock was, I am sure, an important factor in finally bringing him to bankruptcy, and at last accounts a member of his immediate family was an inmate of a charitable institution.

When the buying of drug-store requisites broadens out to the wide field covered by the manufacturers and importers of to-day, a much greater scope of vision is required, as

well as a much closer analysis of individual terms and respective sources of supply.

BUYING DIRECT AT FIRST HAND.

The large retailer who would buy at first hand as much as possible must certainly install some system of keeping proper records of the names of manufacturers and the articles comprised in the output of each of them. Here is work which requires the most accurate knowledge of detail, and here again the matter of quantities, discounts, and terms must be weighed carefully against the amount of money invested. One must consider whether the goods could be obtained at any price from your jobber, and whether the line might be handled as an exclusive agency. Thus all the varying elements of commercial loss and gain and supremacy are involved in this subject, which must be settled by the buyer.

Drug-store buying is, perhaps, a little different from any other kind of buying in that there are so many articles in which the discount extended is dependent entirely upon the quantity of the purchase. While the advantages of grouping purchases from the jobber, when made in small quantities, and obtaining them all from one house and in one shipment, are to be considered, there are, of course, many advantages in purchasing goods *direct* from *first* hands.

The firm which buys its soaps and perfumes from the house founded something over a century ago near Castle Garden, has the advantage of having its orders filled completely, of getting all the "free goods" deals handed out from time to time, and, we hope, of getting full discounts, all of which produce the comfortable feeling that you are on as good a selling basis as any competitor possibly can be.

GET ON THE "DIRECT" OR "PREFERRED" LIST.

Where the shipping quantity is not unreasonably large, it would seem to be proper business practice to make as many of these connections as the size of the dealer's output would justify:

There is a compensating element all through the buying game that should be easily estimated by buyers and sellers all along the line. The dealer who buys \$500 worth of a certain line of imported soaps and perfumes in order to get a 5- or 10-per-cent discount is perhaps in position to know that he has all this line of

goods at the very lowest prices, and that they are fresh and genuine. In fact, he is thoroughly posted on the line.

In this way, while the jobbing house has lost this order, it has also gained a more reasonable customer, for when this same dealer applies to him for any of the items in this line (of which he may temporarily be in need) he knows from experience that the middleman's profit is not any too large, and, if reasonable, he should be willing to pay the price usually asked by the wholesaler. French soaps and perfumes bought in \$500 quantities, f. o. b. New York, with only 5 per cent discount from list, cannot be sold at list in western markets, and the dealer must expect to see the importer's list advanced five or ten per cent. These remarks apply to such goods as Houbigant's, Roger & Gallet's, and Piver's, all of which are sold f. o. b. New York, with only 1 per cent for prompt cash and with very small discounts only for import quantity orders.

"FREE GOODS."

During the past few years the matter of free goods with purchases has been so important an item as to demand the best attention of buyers. The list of articles with which substantial bonuses are given in the way of free goods is quite a long one, and has included many kinds of standard toilet goods and perfumes, malt extracts, cigars, and a considerable number of proprietary articles.

To overlook buying these goods at the proper time in order to obtain the bonus is certainly to throw money away, if any demand exists for the goods, and here is a chance for more vigilance on the part of the buyer. Indifference on this subject means wastefulness.

A "PRICE-BOOK" DESCRIBED.

Where much direct buying is done, it is no easy matter to remember the source of supply where a certain article is obtained, and to assist along this line records can be easily kept that will have a value far out of proportion to the time spent in compiling them.

The best method of which I have knowledge is the use of a book known as the "loose-leaf price-book," the leaves of which are separated by indexed sheets, and from which leaves may be readily removed or replaced so

that any desired record may be type- or hand-written and filed for future use.

In the keeping of such a book, a method must be worked out which best harmonizes with the mental squint of the buyer who is going to make use of this book; for instance, in my own case, under "M" I have grouped all the malt extracts. Here data are kept of the exact source of supply of each product, the price usually paid, the number of bottles in each original cask or case, the allowance for empty bottles, and the points as to cash discounts and whether goods are f. o. b. shipping or destination point.

The rule made in this particular instance, however, is contrary to the way the book is kept as a whole, for I have taught myself in indexing to think of the name of the concern with whom the business is going to be done.

THE INDEXING OF THE BOOK.

For instance, if Capadura cigars were to be obtained I would turn to "B," where on a page, or part of a page, devoted to the firm of Best & Russell of Chicago would be found grouped all the articles purchased regularly of this house, these items being typewritten on the page. Under the same letter "B" (to give actual instances) would be found pasted on a page a small, printed sheet, about 3x6 inches, which bears the name of all the articles made by Dr. J. H. B. Co., this being the printed list supplied by the house giving the regular jobbing price per dozen, and the retail price of a single package, of each article made by them. On this slip is noted the quantity required to obtain maximum discounts, and also information as to cash discounts and whether freight is paid by the sellers or buyers.

Under the letter "R" is a page devoted to the goods of Roger & Gallet, with the New York address of the importer. This firm, of course, like many others, supplies a price list which gives all the information that I have in my "buy book," but it is perhaps scattered through some hundreds of pages. In my book is a list of articles we regularly handle from this line, with their proper catalogue title and number, and the wholesale and retail price. Possibly 50 or 60 lines of information, written on this page, give absolutely all the information we need as to the identity, cost, and selling price of the articles handled by our firm from this long line of goods.

To obtain such information readily from the firm's price list at the moment needed is a more vague and difficult task than one would think, even if he is familiar with this sort of work. All doubt and uncertainty are removed by the little care and work indicated.

"SPECIAL BRANDS."

Where "special brand" goods are made by manufacturers, some system is needed to be able to obtain these goods readily when they are required again, without loss of time in identifying the articles needed. This trouble can readily be obviated by keeping a record under the name of the firm from whom the purchase is made, stating the name of the private brand, where and when obtained, and in what quantity. In this way time is saved and confusion is avoided.

Under the heading of "Standard Oil Co." in my buyer's book I have entries made of barely a half-dozen items, but these are things that it is found convenient to refer to quite frequently. The record makes buying and selling easier, and grounds them on the solid foundation of absolute fact rather than guess-work.

This particular record, to quote some special items, reads:

- 5—1-'09—10 cases 100 lbs. each Paraffine at
cents per lb. in 1-lb. cakes, our name on
wrappers.
12—6-'10—1 barrel No. 0 Petrolatum, 36½ lbs. at
cents per lb.

In such a record, well kept, is found the best possible basis for careful, correct buying and larger and better sales. As regards lines of goods where hundreds and thousands of articles are purchased from a single manufacturer, as, for instance, the products of pharmaceutical houses, reliance must be made almost solely on the current price lists furnished by these firms, and it is necessary for the buyer to be posted only on the discounts extended on these lines; but here, again, prices extended on certain *special items* obtained from one of these firms may be grouped under the heading of that firm, where ready references can be made when needful.

KNOW THE COST AND SELLING PRICE!

These remarks would particularly apply to "name goods" or "customer's card" articles put out by such houses where the identity of the maker is somewhat difficult to remember.

An adequate knowledge of the *cost* of goods and the *selling* price is a very important and yet much neglected consideration all along the line in the retail drug trade, and this subject is closely allied to buying.

In a stock of goods recently acquired, whole lines of articles were found with absolutely no cost or selling prices attached to them; in fact, there had been an absolute disregard of these details all through the business with so much guessing left to be done each day that it is not strange that the business was not a successful one.

THE REQUISITES OF A GOOD BUYER.

It would seem that the primary requisites of a buyer are to be able to estimate, by the light

of experience and reasoning by analogy, just how successful a new line of goods is likely to be; to have the courage and sagacity to take up such articles at the psychological moment and not wait until the day after the show to look for the elephant; and last of all to remember that buying is of first importance in the welfare of the business, that goods can only in rare instances be sold before they are bought, that the work of purchasing must receive careful, methodical attention every day, and that each item of stock for which some customer is likely to call in the store is an invisible thread drawing that customer to the establishment. If the customer is disappointed by not finding the article sought the thread is broken and may not easily be repaired.

PAINTS AND BRUSHES IN THE WINDOW.

We are showing this month another one of the window displays designed by J. Earl Taylor, Ph.G., Gridley, Ill. It was devoted to the line of paints and brushes, and while it was gotten up during the spring, it is almost equally applicable to the fall. Mr. Taylor

color cards were also featured here and there throughout the window, and specimen cans of the paints themselves were exhibited. Wallpaper cleaners were made a part of the trim. The color scheme of the window was red and white, and there were several placards to tell

assures us that the window display proved a money-maker and resulted in a much greater sale of brushes than had been realized the year before.

A showing was made of every particular kind of brush carried in stock. Paint and

the observer quickly what it was all about. The background, as will be seen from the engraving, was carefully worked out, and must have assisted to make the window very attractive. Other details of the trim are self-explanatory and require no description.

DOLLAR IDEAS

SMALL CONTAINERS IN THE PRESCRIPTION DEPARTMENT.

John McCofflin, Vicksburg, Miss.: Every druggist knows that there accumulates in the prescription department a lot of small containers of various chemicals which take up a good deal of room and are frequently rather hard to find when wanted. To obviate this difficulty we got up a series of 15 cardboard boxes of uniform size and provided with covers. These occupy the entire top shelf of the

<i>Amn. Sed. Atropine</i> <i>Antitussive Aspirin</i> <i>Ang. med. Ang. Med.</i>	<i>Berlin Mun</i> <i>Bisone</i> <i>Methylth. Blue</i>	<i>Cougher</i> <i>Chlorotane</i> <i>Codeine</i>
# 1	# 2	# 3
<i>Amn. Sed. Atropine</i> <i>Antitussive Aspirin</i> <i>Ang. med. Ang. Med.</i>	<i>Berlin Mun</i> <i>Bisone</i> <i>Methylth. Blue</i>	<i>Cougher</i> <i>Chlorotane</i> <i>Codeine</i>

prescription case. Each box is 7 inches long, 5 inches wide, and 3 inches deep. The boxes are numbered from 1 to 15 on the front edges of the covers. The small bottles of chemicals, etc., are placed upright in the boxes, and the contents of each box are then written in duplicate on the top and on the front of the boxes, as shown in the accompanying rough pen sketch. This method has proved very satisfactory for the keeping of small packages of such things as aspirin, atropine, codeine, dionin, and the like.

CO-OPERATIVE LOCAL ADVERTISING.

Frank Green, Jr., Skidmore, Mo.: This is an idea that we use very successfully. We keep a list of the manufacturing jewelry, sundry, proprietary and patent medicine concerns, etc., whose goods we stock and desire to "push." To these concerns we mail postals twice a year, asking a share of any advertising they may have for local display or distribution. We also request their coöperation in local advertising, assuring them of our desire to use it for our mutual benefit. We mail these requests about May 1 and October 1, and we always receive a very generous response from the various houses each time they are mailed. The careful, judicious use of this

local advertising has greatly repaid us by creating a demand for goods from which we have reaped a profit that would have otherwise been lost.

USING A SLOGAN.

O. P. McPherson, Gloster, Miss.: Many people throw away more money in badly managed advertising than others make. An advertisement not properly worded is worse than none at all. If you adopt any phrase, word, or sentence, push it until it becomes a household word. Repeat the slogan until it belongs to you. One of my expressions is: "'Tis push or we'll get pushed." Two seasons ago I had some fans gotten out bearing my ad., etc., and had printed on them this verse:

Lady, if by chance you should fan
The August wind to the proper man,
Don't use this fan to hide your blush
But keep it going with the proper push,
For this day and time in which we stand,
Like time and tide, wait for no man.
And this our MOTTO as the trade we rush:
"'Tis either push or we'll get pushed."

All our bill-heads and letter-heads bear that sentence. It belongs to us.

TO REMOVE TIGHT CORKS.

Stewart T. McGee, South Berkeley, Cal.: In pulling a cork it sometimes sticks so tightly that the corkscrew is drawn out through the stopper, thus mutilating it. The cork must then be removed piecemeal, and consequently small pieces drop into the container, with the result the liquid must be strained.

To prevent this accident insert the corkscrew between the cork and the lip of the container. The stopper will slip out easily.

TO REMOVE SILVER NITRATE STAINS.

P. I. Minton, Plainfield, N. J.: First saturate the spot with tincture of iodine, then decolorize with sodium thiosulphate. This never fails.

An ink spot will always yield to this process: first apply with a camel's-hair brush a 50-per-cent solution of Javelle water, then a 20-per-cent solution of acetic acid. Afterwards rinse with pure water and the stain will vanish.

LETTERS

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

A CIRCULATING LIBRARY.

To the Editors:

Being very much interested in Mr. C. A. Weaver's article in the July BULLETIN on conducting a circulating library as a side-line in a drug store, I submit my own ideas.

Being in a town of about 3000 inhabitants, my plan differs somewhat from his and I think is much less complicated. I have a sheet like No. 1 pasted in front of the book,

THIS BOOK IS THE PROPERTY OF					
The Keifer Drug Company's					
Popular Fiction		Library			
Marshall, Ill.			Telephone Wabash 8		
All the new books all the time—others on request					
Out	In	Out	In	Out	In
Damages, beyond reasonable wear, and losses must be made good by the borrower					
Join our Magazine Library. Thirteen of the popular magazines. You may read the entire list for 25 cents per month.					

No. 1.

then an ordinary tablet much like No. 2 keeps a record of the book out, to whom rented, etc. I charge three cents a day with a minimum rental of five cents. A book is usually borrowed for from one to three days, which makes the rental reasonable even at three cents a day.

I can tell at any time what each book has earned. I started December 1, 1910. At that time I bought twenty-five new publications, knowing that I needed the books that were being advertised and reviewed in the daily

papers and monthly magazines. From time to time I have added some popular copyrights and new publications, buying copyrights which I had read and knew to be good. I now, on August 1, 1911, own seventy-five books, most-

Name of renter	Title of book	Date out	Date in	Total of rental

No. 2.

ly publications of the past season, the balance being popular copyrights.

When any strangers come in I require a deposit of \$1 on each book. When it is returned I give back the dollar less the rental. After eight months I have paid for all books and magazine subscriptions, and have a profit of \$27.52.

Mr. Weaver, speaking of "The Rosary,"

Keifer Drug Company's	
MAGAZINE LIBRARY	
Marshall, Ill.	Telephone Wabash 8
1. Argosy	7. Hampton's
2. Ainslee's	8. Lippincott's
3. Adventure	9. Ladies' Home Journal
4. Blue Book	10. Munsey's
5. Cosmopolitan	11. Metropolitan
6. Everybody's	12. Popular
13. Woman's Home Companion	
TERMS:—Membership is free. You may read the entire list for 25 cents per month.	
RULES:—You can have one magazine at a time. Change as often as desired, or can keep magazine 7 days.	
Our Magazine Cover insures each person getting a clean magazine at all times.	
JOIN our Circulating Library of Popular Fiction. No membership fee. Rental fees, 3 cents a day per volume. Minimum charge, 5 cents. All the New Books All the Time.	

No. 3.

says that it has been the best renter, being out almost constantly.

I have only lost one book. Our plan has been to give a customer an opportunity to buy a book outright where the rental is unusually high. In connection with the book library, we have conducted a magazine club which

pays splendidly. I subscribe for thirteen best-selling magazines. At first I had sixteen, but 13 was enough. While this paid, we reduced the number to twelve a month. That, we felt, was sufficient considering the charge. No two good magazines can be bought on news stands for 25 cents. I have stiff covers for each magazine, with a slip like No. 3 pasted on the front. I take the name of the subscriber and the 25 cents in advance each month, giving the customer the privilege of reading all twelve.

I find the average reader will get over six to ten a month. Outside the combined profits from club and library, the pleasure of handling, reading, and owning a nice little fiction library has been much. One should read the books as soon as possible and know the readers' tastes, so as to be able to suggest books to patrons in doubt. I find much can be done by "talking" the books. People left to make their own choice will often go out without a book.

As Mr. Weaver sums it up, the advertising is good. Books often appeal to people whom nothing else will attract. You gain customers by talking literature to one brought into your store by such a library. You can gain a friend also, for there is no medicine that will bring people nearer together than books in which each is interested. The cooler months are the reading months. Then when soda business is light, your library returns will, if conducted rightly, average up with those of the other side-lines.

THE POISON LAW.

To the Editors:

I was very much impressed by the article "Sane Comment on Current Topics" in the July issue of the BULLETIN, and particularly the comment on the "Poison Cork Bill" or the Hinckley Bill. I have in mind, however, an idea which I think I shall put in practice as soon as I can devise a suitable form under which to adopt it.

From a number of the BULLETIN about two years ago I appropriated this idea regarding the sale of liquor and poisons, which I found resulted in much good to myself and disturbed many sales of would-be boozers who simply would not sign such a blank for fear

of getting in trouble, while all honest buyers had no fear of signing it at all. My idea is to draw up a form similar to this plan, something on the following order:

"As the law known as the Poison Cork Law of the State of Michigan requires that all poisons in Schedules A and B including (names of all drugs affected to be inserted here) be put in a container having a cork with a serrated, metal, glass, or celluloid edge sufficient to designate the same as a poison in darkness or daylight and approved by the State Board of Health, therefore I (name of purchaser), the undersigned, hereby certify that (the name of druggist) the person or druggist from whom I purchased (2 ounces of carbolic acid) on (date) fully complied with such law and delivered same to me in proper condition as required by it.

"Signed (by person making purchase and address of same)."

Then I should file these away in a scrap-book, fastening them in the order purchased as would be designated by date on each. Kindly discuss in next issue of BULLETIN, and oblige,

L. M. O'DELL.

Webberville, Mich.

[EDITOR'S NOTE.—We shall be glad to have any expressions of opinion on this subject.]

SHORTER HOURS.

To the Editors:

In your May number I noticed a letter signed "Burton L. Bennett" *re* chemists' assistants' hours.

He throws cold water, almost ice water, on the sixty-hour project. Would it surprise "B. L. B." to know that in this State a sixty-hour week has been compulsory since 1899? I do not notice much amiss taking place among the pharmacists here. And, too, for two years we have been working under a ruling of the court making an assistant's week fifty-seven hours. Still, marvelous to relate, business continues at the same old address. If Mr. Bennett accepted sixty hours for a week's work, anybody not absolutely prejudiced could see the men would be fresher in brain and body and better for their master's business and their own welfare. Examine this extract from our friend's argument:

"The clerk . . . has many leisure moments in which to chat with friends, etc."

The obvious answer is, at any rate in a busy pharmacy, "Yes, I don't think."

In conclusion, sirs, I submit the following resolution:

"That as forty-eight hours are a fair week's work for a laborer or tradesman, so an assistant who desires a sixty-hour week is not only not unfair to his employer, but is distinctly unfair to himself."

I have seconded the above and carried the motion, so don't worry. I also move that three hips and one hurrah be given the shorter-hour movement and groans to "B. L. B." and his friends.

Coogee, Sydney, N. S. W.

MORE ON BEER SEED.

To the Editors:

On page 263 of the June issue of the BULLETIN you reply to my question as to what is beer seed. Recently I found an article in the *Home and Farm*, Louisville, Ky., July 15, 1911, on the same subject. It reads as follows:

"That little item, the jar of beer on the cook table, has stirred up quite a hornet nest of interest. Three dozen is a safe estimate of the number of inquiries that have come. And the range is rather large. In every Southern State except Florida and Virginia, and even as far north as Idaho and away out in New Mexico, calls have come for beer seed. I believe I would be safe in saying that altogether it has taken more than half a day to attend to them, but I do not begrudge the time; it has given me a great deal of pleasure to thus serve my fellow men. I have learned some things about it that are worth a little something.

"The seeds, it is said, may be dried, put away and kept indefinitely. One correspondent asked for some; but the writer put some 'green' in a small tin box and sent it along, his 2-cent stamp being ample, and sent it under seal. A neighbor said yesterday that one way to get a start was to boil whole kernels of corn till soft, add plenty of water and molasses, and let it develop an acid.

"This is called corn beer and is often made. If the fermentation continues long enough, in time it will develop seed; and that was the way it was started. He was sure of this, for

his mother had often made the seed that way. It seemed to work best with sorghum syrup. The writer has been trying it with granulated sugar and finds it makes something fine, but it takes longer. With sorghum it will in time make a fairly good vinegar. It might also ferment with other sweetening."

W. R. MINISH, SR.

PATENT MEDICINES AND THE DRUGGIST.

To the Editors:

If the druggist does not make 10 per cent profit on the patent medicines he handles, he *cannot* do business without a loss. Here are the auditing of bills, the investment of money, the clerk's time, wrapping, etc. Every now and then the clerk will break a bottle, but the proprietor never hears of that unless he is on deck at the time. The clerk will throw the debris in the waste box or basket, or in the ash barrel. He will not want to be accused of carelessness. This is a direct loss.

Next comes a frequent customer who asks for a little credit. You do not like to refuse. But he will defer settlement, and perhaps through hard luck will never pay. Another: A lady rushes into the drug store in a hurry and says, "Please give me a bottle of Lydia Pinkham's Compound, Swamp Root, or Pierce's Golden Medical Discovery." She feels for her pocketbook and then bursts out: "Oh, Mr. Druggist, I have left my pocketbook at home on the bureau. I will pay you when I come over again. My daughter hurried me so as she wanted it right away, and I have to hurry to satisfy her. I will pay you tomorrow."

Perhaps you will never get it. Ordinarily you can charge it up to profit and loss. The druggist usually says: "All right, Mrs. Brown, take it along—you can pay for it when you come again."

The foregoing is, I think, the practical every-day experience of the average druggist.

Camden, N. J.

JUNIUS PESTLE.

SOME THOUGHTS ON WINDOW DISPLAYS.

To the Editors:

We allow our displays to remain one week, making alterations occasionally during the week. Our window is the most unique in material and appearance, being considered by

our patrons and passers-by as first-class, up-to-date advertising. We never use crêpe paper, having special fixtures of mahogany and oak and glass shelves. A plate-glass French mirror supported by nickel brackets sets in back of the glass shelves. The display of articles is very unique and gets business.

We always display sundries, stationery, toilet articles, rubber goods, surgical supplies and appliances, in fact a full sundry line. This brings more customers to our store and helps to sell the goods.

During the months of May, June, July and August we constantly display hydrogen peroxide, our usual trim consisting of 5 gross, which sell very fast.

We never display patented medicines, nor do we advertise them, aiming at a strictly ethical way of doing business. The following are our reasons for eliminating patent medicine displays:

1. The public attention need not be brought to the display of patent medicines, for such goods are constantly advertised on bill-boards and in the press. If people are in need of any article they go to a local drug store and ask for it.

2. Is a patent display profitable? No. I refer to the cut-price evil, excessive competitions, small margin of profit, etc.

3. Does the patent medicine manufacturer pay the druggist for window space? Most emphatically no. We adopt a strictly ethical standard for window displays as well as for other departments of the store.

Chicago, Ill.

V. B. R. SIMANOVSKY.

PUSH YOUR OWN REMEDIES.

To the Editors:

I have been reading with interest the articles on "The Druggist and His Profits."

Your columns should be filled each issue with details of how to overcome the low earnings. To my mind the important question is this: What does your *bank account* show at the end of the year after all is cleaned up, rents, salaries, losses, etc.? How can one swell it? Only profits will do it.

What is your Dispensary for, books of pharmacy, etc.? Hunt the channels of profit. Manufacture and get into a beautiful line of work.

What does a physician get for his work?

The earth! A homeopathic one-ounce dilution brings 25 cents. It costs about 3 cents. But we pay \$8 a dozen for patent medicines which can be mixed, boxed, and made ready for shipment for \$1.50. I make everything but the shelving and glassware.

Come out of it. With sympathy for all pharmacists that need repair, I am,

Yours,

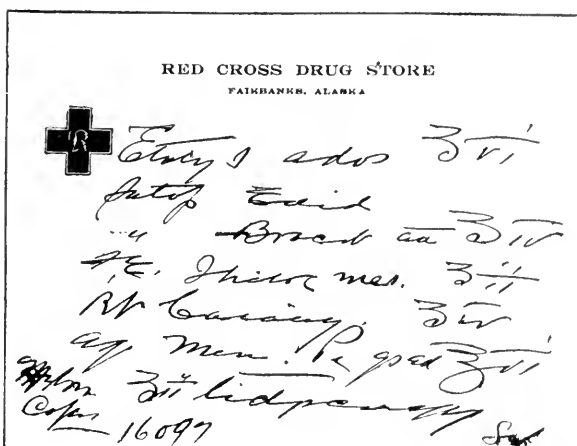

Pawnee, Ill.

O. N. SPRAGUE.

HE MADE IT OUT.

To the Editors:

In our May issue we reproduced the following illegible prescription:

W. Moltzen of Fairbanks, Alaska, has evidently succeeded in deciphering it. He writes:

"The foregoing prescription is evidently written backwards. That is a nasty trick on the customer, but I have known it to be practiced by the drug stores in some localities. I have been up against the same thing myself.

Soda salicylate.....6 drachms.
 Potass. iodide,
 Potass. bicarb., ää.....4 drachms.
 F.E. colchicum sem.....2 drachms.
 Tr. guaiac.....4 drachms.
 Aq. menth. pip., q. s. ad.....6 ounces.

M. ft. Sig.: 2 drachms t. i. d., p. c. in aq.

"We always use the true soda salicylate in this mixture. When finished the prescription is a beautiful greenish color."

Fairbanks, Alaska.

W. MOLTZEN.

To the Editors:

The BULLETINS contain so much good reading that people try to swipe them out of my store.

H. L. MITCHELL.

THE SODA FOUNTAIN.

SOME SODA POINTERS.

BY JONAH F. RUPERT.

Plain sodas are not much called for at present, it seems. However, they are rapidly dispensed and offer better profits than fancy drinks and perhaps ice-cream drinks.

At present I see some fountains supplying plain sodas in straight glasses, drawing them "solid." Others still stick to the bell glass and foam. Personally, I would advise the bell glass for vanilla and chocolate when dispensed with cream, and the straight glass without foam for other common flavors. It might be a good plan to dispense straight sodas without a holder, especially at the counter. I rather favor the plan, but never formed a rule as to this idea.

Ice-cream sodas foam easily enough, and soda foam is of no use in syrup when phosphates are dispensed. Soda foam does not add to the flavor when dispensed with syrups, and, indeed, increases any tendency to sour.

As regards chocolate, the best should be used. Chocolate should always be heated to boiling before dispensing. Vanilla should be added as directed to the chocolate syrup. Chocolate should never be dispensed from cans for the reason that the can cannot be easily cleansed and chocolate should be well shaken before dispensing. The fact is that many people will judge your ability as a soda expert by the quality of your chocolate.

Soda water must be well mixed with the syrup. It will not do to trust to the "fine stream" to do this for you. This only takes time and does not insure a thorough operation. Stir with a spoon. This stirring might be done when the desired amount of solid water is delivered into the glass; then finish with the fine stream, if desired.

SERVING ICE-CREAM SODAS.

In mixing an ice-cream soda, I always insisted on one point. In this I have been encouraged by the like practice of many other fizz artists and the advice of expert soda men. In Remington's "Practice of Pharmacy" I read these words: "In dispensing ice-cream soda first mix the syrup and soda water thoroughly with a spoon before adding the ice cream." This is the point I have always insisted upon, and it seems so reasonable that I cannot see why any one should want to advise the contrary on this subject. I believe this very point will do much to either please or displease the customers, according as to whether it is or is not followed.

For instance, suppose we run in the syrup, add the ice cream, and then the soda. Usually those who practice this trust to the fine stream to stir up the mixture. A sweet lady customer applies her dainty lips to the julep, and if the straw has been pushed to the bottom, as is most likely, she receives almost pure syrup into her mouth. Pure syrup might not be thought as distasteful as pure soda water. Indeed, pure soda water

is enjoyed by very few when unmixed with sweetening and flavoring. Should she not press the straw to the bottom we likely will be asked to add more syrup to the mixture, for the reason that the part she drank was not sufficiently mixed with the syrup at the bottom. Either way, we have "balled up the matter."

Still a worse plan is to put in the ice cream first, then the syrup, and again, finally the soda. This plan allows for running in almost any amount of syrup, for we cannot well judge of the amount because of the contained ice cream. I run in the syrup first, add considerable water next, then stir with a spoon. Next I add the ice cream, and finish with the fine stream, giving as liberal a quantity of ice cream as possible.

GET 10 CENTS.

Never charge the same price for ice-cream sodas and plain sodas—certainly one is worth more than the other. Usually those who furnish ice cream with 5-cent sodas also furnish a 10-cent ice-cream soda, and the practice leads to hopeless confusion. Give a strictly plain soda for 5 cents and a strictly first-class ice-cream soda for 10 cents.

Should you meet with a customer who insists on having the ice cream in a soda for 5 cents, rather than fuss and hand him a bit to satisfy him, at the same time properly explaining the matter. Of course, we will not expect that many of these cranks will appear and insist on having ice cream in the soda for 5 cents. Usually they really do not want the ice cream, but only want to quarrel.

SELLING MINERAL WATERS.

As to selling mineral waters, it requires little investment to keep several bottles of several kinds on ice. Mineral water, especially the bitter waters, are very distasteful when not cold. I would not recommend a fountain doing a small business to attempt anything more pretentious than "splits." However, a local trade might be developed on a small scale on a standard water, usually bitter water, furnishing several doses to the bottle.

In the soda business we must not attempt too much. Much rather have a small business, conducted on thoroughly adequate principles, than a large business with inadequate facilities.

As glasses represent a considerable part of the expenses, a tendency exists to use glasses having chipped rims. However slight this chipping may be, discard such a glass. The appearance is most decidedly bad. It need not be thrown away; it can be used at home, or sold to friends at a reduced price.

All metal about the fountain must be kept brightly shined. Also, all spoons and other silverware must receive prompt attention.

Mirrors must be kept clear of fly-specks.

CLEANING GLASSES.

Soiled glasses must be removed at once; the tables then thoroughly cleansed. The practice of some clerks of spreading a few drops of melted cream or syrup all over the table with a towel and calling the operation cleansing, makes one indifferent to the best interests of the fountain. A sponge should be kept solely for this service, and must be kept washed out in soda water. After the spilt matter is removed, the

other parts of the table can be washed with the sponge before the spots are touched up; the whole having been sponged, all is wiped dry with a towel.

We must be careful not to apply the unrinsed soda sponge to the varnished surface of a table as it will remove the paint. Marble or stone-surfaced tables, however, allow the use of alkali solutions in cleansing. Tables should be thoroughly washed at least once daily with soap and warm water. The use of display tables is an expensive investment, and their surface requires more work and attention to be kept in a shining condition. However, we find them in the most elaborately furnished rooms.

Nothing dissipates a soda appetite as thoroughly as sitting at a table some time before the soiled glasses are removed. I make it a plan of not allowing customers to be seated before the tables are cleared away, should matters be somewhat delayed in case of a rush.

As to washing glasses, I always have used a solution of washing soda. The washing bench is arranged so that on one side is contained a strong solution of washing soda, about 2 pounds to 4 gallons of water. The glasses can then be rinsed either in flowing water or in a reservoir and placed on a drain board. This soda solution removes the fat thoroughly from the glasses, and when rinsed in clear water they present shining sides. Glasses should always be dried and shined before reusing. A wet surface against a lady's glove or hand will not improve business.

SOME ICE CREAMS.

BANANA ICE CREAM.

To make one gallon of banana ice cream, reduce six nice, ripe bananas to a pulp by beating them with a cream beater, and then mix eight or ten ounces of sugar and the juice of one lemon into the pulp. Add five pints of cream and freeze. The usual amount of gelatin should, of course, be added to the mixture. The cream can be replaced with any desired mixture, the quality of the cream depending entirely upon the mixture used. The above quantity should produce with the proper swell about a gallon of banana ice cream.

PINEAPPLE ICE CREAM.

To prepare pineapples for use in ice cream, peel, remove the core and eyes, and run them through a fruit chopper, using a very fine cutter. Use about two quarts of this fruit to a five-gallon batch; more can be used, but this will give a good flavor. For five gallons use eight or nine quarts of cream or any correct mixture of cream and milk; three and one-half or four pounds of sugar, and two ounces of gelatin or other binder. The sugar may be dissolved either in the fruit or the cream, and should be mixed just before freezing. Some cook the pineapple until it is tender, but to our minds the raw fruit is better.

CARAMEL ICE CREAM.

No. 1.—Caramel ice cream may be made by adding caramel (burnt sugar coloring) to any standard vanilla mix, a pint of caramel being about right for a forty-quart batch.

No. 2.—The following will be found to be a very satisfactory formula for the preparation of this cream:

Place seven pounds of sugar and one quart of water in a copper pan and let it come to a boil; add the juice of one lemon or a little cream of tartar. Take off any scum with a skimmer that may arise. Wash down the sides of the kettle with a wet sponge, being careful not to allow the sugar on the side of the pan to brown or burn and thus cause a bitter taste. Boil the sugar to 315° or 320° and watch closely; at this point it turns yellow, begins to smoke, and turns brown. A large batch will look darker than a small batch in the pan. This point will be about 340° to 350° Fahr. When it reaches a brown color put in one quart of water very carefully, because it will boil up suddenly and act just like water poured on a hot stove. The water prevents the sugar from turning black and checks the boiling. Now remove the syrup from the fire and gradually add to it one gallon of the cream. Mix your filler with the balance of the cream—about three to four gallons—and bring both together; let it cool if too warm and freeze. When frozen add a little extract of vanilla.

Another method is to boil the sugar to 315°, then to watch very closely until it reaches from 350° to 360° and turns brown. Take off the fire and turn on a slab, spread very thin, and when cold grind into a powder, using as much of this as necessary to impart the desired flavor to the cream, dissolving it warm.

When a really fine caramel ice cream is wanted boil the sugar to 265° and add one and one-half pounds of blanched and dried almonds, cook until the almonds are well roasted, and pour on the slab very thin. When cold grind as above and use about one-half pound of it to each gallon of caramel ice cream, adding sufficient caramel coloring, vanilla beans, and two drops of rose flavor.

THE ORANGE AND ITS USES.

The orange is one of the most useful of all nature's products to the dispenser of carbonated beverages, and with the possible exception of chocolate, there is no more popular flavor at the soda fountain than orange. Perhaps the best of all orange drinks is the orange phosphate; and it is not to be wondered at, for it is one of the most refreshing drinks that can be served. Oranges are also employed in the preparation of many of the fancy drinks that are now so popular, as the phosphate and orange syrup forms one of the ingredients of many of the fancy and tonic syrups.

In an article of this nature it would, of course, be impossible to give all the formulas in which orange and orange syrup are used; but we shall endeavor to give those in which it can be said to form one of the principal ingredients. Orange as a flavor possesses many advantages. It is acid, and yet does not possess the decided acid taste of either the lemon or the lime. In it we seem to find a happy medium so desirable in fountain beverages, in that it satisfies the taste of the majority. It would probably be hard to find any regular patron of the soda fountain who does not at some time, in the course of the season, take either an orange phosphate or some other of the beverages of which orange forms the principal part. No syrup enjoys such an extensive use for the flavor of egg drinks as the

orange syrup, either alone or in combination with other flavors. It is probably the best flavor for this purpose that the dispenser has found up to the present time. Although there are several ways in which orange syrup may be prepared, the best, as is the case of all other fruit flavors, is made from fruit direct. Several formulas for manufacturing are published, but the fruit syrup is strongly recommended, although there may be cases in which some other method of its preparation may be advisable.

ORANGE FRUIT SYRUP.

Select from six to eight fine, juicy oranges, according to the size and strength of flavor desired. In selecting oranges, choose those that have a dark, richly colored skin—that is, rich in oil—as they will impart the pleasing color to the finished drink without the aid of any coloring matter. Our experience leads us to believe that the California navel orange is the best that can be obtained, as it gives a fine color and is rich in natural flavor. Next to the navel orange is the Vanicila seedling or California summer orange. Care should be taken that the fruit is both sound and ripe. Having selected the fruit, the next step is to grate the rinds. In doing this, you must be careful to grate only the yellow part. When all the oranges have been grated, place the gratings in a suitable vessel. At this point there is a choice of methods of procedure: you may either add your sugar alone, or you can first add a little alcohol, and then the sugar. Some dispensers claim that a better syrup can be made by the use of alcohol; but many varied and careful experiments have led us to believe that the alcohol is unnecessary, and may as well be eliminated from the formula.

If the alcohol is used, pour one-half to one ounce of alcohol over the gratings, and rub well for a few minutes to allow the alcohol to cut the oil. Then add from six to twelve ounces of granulated sugar, rubbing thoroughly with a pestle, that the sugar may absorb the oil. If there is too much moisture, more sugar may be added. A little practice is better than any set rule, as oranges vary as to the amount of oil or other moisture which they contain. When the sugar and the grated rinds have been thoroughly incorporated, allow the mixture to stand for a little while—over night when possible. When you are ready to finish the syrup, express the juice from the oranges, strain it through a cloth strainer, and pour it into the mixture of sugar and gratings; stir until the sugar is thoroughly dissolved in the juice.

When this is done strain through a double thickness of cheese-cloth, expressing all the juice that can be obtained by hand-pressure, and add sufficient simple syrup to make one gallon of fancy product. To this may be added, if desired, from one-half to an ounce of fruit acid. Where the syrup is used for ice-cream sodas, it is preferable to leave the fruit acid out, and add a little more of the acid phosphate, when phosphates are called for.

"Practice makes perfect" is a saying that is as true when applied to the preparation of syrups as to anything else. Oranges differ both in size and in flavoring power, and therefore upon your ability to judge when the syrup is just right rests your ability as a syrup-

maker, and nothing but practice and experience can supply this information. It cannot be imparted by instructions.—E. F. WHITE, in the *International Confectioner*.

SODA SIGNS.

"There are more ways than one," says Charles Philip Krauth, of Philadelphia, "of arranging announcements at the soda fountain so as to attract the notice of the passer-by." Writing in *Merck's Report* he suggests a few ideas which have already been tried out. In your neighborhood they may be distinctly new.

"Some druggists with four signs to put up, place them in the four corners of the window, slanting them at an angle of forty-five degrees from side to sill and side to top. This attracts the eye much better than merely pasting each closely into a corner.

"A druggist with an eye to decoration, and three announcements to place, did so in a rather original way. The signs were pasted horizontally across the middle of the glass, the middle sign a little above the other two, which were on a line. Thin bars of crêpe-paper ribbon (twisted) were secured, at the ends, to the back of each sign and stretched down to the back of the sill.

"Another man, with only one sign, made it the top beam in a Greek portico. The sign was placed in the middle of one window-pane. Four pillars, composed of three crêpe-paper ribbons each, stretched flat against the glass from the bottom of the sign to the sill. The elongated, triangular top of the portico was formed of ribbons stretched from regular points on the top of the sign to a rosette a little above the center of the glass.

"A good deal depends on the number of announcements you have to make. There are many variations of arrangements by which you can catch the public eye. But in placing signs always remember that legibility comes first. To paste your announcements one over the other, in a haphazard way, like cigar bands on a plate, would be original, but very few people would ever try to read them."

FANCY LEMON BEVERAGES.

[From the *International Confectioner*.]

A GAME WINNER.

Into a mixing-glass squeeze the juice of one lemon, and add one and one-half ounces of simple syrup, and one ounce of grape juice. Into this break an egg, and add a little finely shaved ice. Shake thoroughly and fill with carbonated water. Then strain into a twelve-ounce glass.

HENRIETTA.

Into a twelve-ounce glass, draw one and one-half ounces of lemon syrup and add the juice of one lemon and two dashes of lime juice. Fill one-third full of fine ice and the balance with carbonated water. Mix and decorate with fruits. An ounce of white grape juice may be added to this formula if desired.

AMERICAN LEMONADE.

Into a twelve-ounce glass draw one ounce of lemon syrup and one-half ounce of orange syrup. Add two or three dashes of phosphate, and one-third glass of fine ice. Fill with carbonated water, mix, and decorate with slices of lemon.

BUSINESS HINTS

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

A Euthymol Display.—

The window reproduced in the accompanying engraving was gotten up in Kotte's pharmacy, which is located at the southeast corner of 6th and Elm Streets in Cincinnati, Ohio. As will be readily seen, the display was primarily given up to Euthymol Tooth Paste, al-

though some of the other Euthymol products are in evidence here and there throughout the window. From the sign across the front, underneath the window proper, it would appear that the Kotte people do a nice business in ice-cream soda.

A Good Display Sign.—

James S. Gleghorn, proprietor of the "Quality Drug Store" in Waynesburg, Pa., has had the accompanying big sign painted. It is in a location where it shows

to advantage and is certainly very striking. Mr. Gleghorn speaks of it as the "niftiest display sign in town."

In Buying Goods.—

Charles R. Sherman, of the Sherman & McConnell Drug Co., Omaha, Neb., owners of a group of eight or more stores, read an exceedingly valuable paper on the buying of goods at the last meeting of the Nebraska State Pharmaceutical Association. Mr. Sherman went

CHECKER'S TICKET MERCHANDISE

No. Cases, Bbls. or Pkgs.
in this Shipment.....

Date of Invoice.....

Checker

Contents of Pkg.....

Amount of Contents.....

From whom Purchased.....

Selling Price.....

SHERMAN & McCONNELL DRUG CO.
OMAHA, NEB.

into the subject with characteristic thoroughness, and among other things described his system of recording purchases. A very essential part of the scheme is indicated by the "checker's ticket" reproduced herewith. One of these is attached to every parcel, and the idea is sufficiently self-explanatory.

A Bill-board Ad.—

The accompanying engraving illustrates a bill-board in the town of Emporia, Kansas. Three ads. are to be

seen, and the middle one is that of the Red Cross Pharmacy of Emporia.

W. A. BROWNE, who for the past eleven years has been manager and advertising man for Green The Druggist, Springfield, Mass., resigned his position August 19.

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

A Mentholated Face Lotion.

O. P. writes: "Could you publish a formula for a mentholated face lotion for barbers' use, the color of which would be slightly purple? The alcohol content should not exceed 8 per cent. I made a lotion which I thought was similar to one I saw, using potassium permanganate, menthol, alcohol, and water, but I found that alcohol was incompatible with potassium permanganate and also that the latter was incompatible with menthol."

Here are a couple of formulas that you might try:

- (1) Menthol.....12 to 30 grains.
Oil of bergamot.....15 to 30 minims.
Glycerin.....4 drachms.
Alcohol.....1½ ounces.
Ammon. carb.....8 grains.
Tinct. of cudbear.....q. s.
Water, to make.....1 pint.

Dissolve the menthol and oil of bergamot in the alcohol, add the glycerin, and then the water in which the ammonium carbonate has been dissolved. Filter through magnesium carbonate and add enough tincture of cudbear to color.

- (2) Menthol.....12 to 30 grains.
Oil of lavender.....6 minims.
Po. tragacanth.....30 grains.
Glycerin.....½ ounce.
Alcohol.....1½ ounces.
Ammonium carbonate.....10 grains.
Tinct. of cudbear.....q. s.
Water, to make.....1 pint.

Dissolve the menthol and oil of lavender in the alcohol, add the tragacanth and glycerin, then add the water in which the ammonium carbonate has been dissolved. Shake vigorously until a smooth mixture is obtained, and then color with the tincture of cudbear.

A more reddish color, bordering on purple, will be obtained by using carmine in the place of cudbear.

Decolorizing Tincture of Iodine.

F. A. P. writes as follows: "I notice in the July BULLETIN, on page 300, the formula of Emil Reyer for decolorizing tincture of iodine. Mr. Reyer says that his formula is a quick one. The one I use may not be new, but it is even quicker. I should like to have you state to what extent, if any, the value of the tincture is impaired by the decolorizing agents:

Carbolic acid.....½ drachm.
Strong ammonia.....1½ drachms.
Tincture of iodine U. S. P., enough
to make.....1 ounce.

"A little shaking."

It is our belief that tincture of iodine suffers a loss of therapeutic value when it is decolorized. In this formula, for example, the metallic iodine is converted into ammonium iodide, and the salt is in our opinion far less efficient medicinally than the metal. For the past eighteen months we have been running across

literature, particularly in the medical journals, on the use of tincture of iodine for surgical purposes. It is said to have a marked antiseptic property. It penetrates the tissues and disinfects the skin perhaps more effectively than any other disinfectant obtainable. Whether the iodide salts found in decolorized solutions of iodine have this antiseptic property is extremely questionable. True, they do not stain dressings or tissues as does iodine, but it is equally true that they have less germicidal power than metallic iodine.

Show-card Ink.

A. P. L.—A common method for making an ink for show-card purposes is to dissolve a teaspoonful of some aniline dye in a pint of water by the aid of heat, in this solution dissolving an ounce of yellow dextrin to give body to the ink.

Another formula is the following:

Shellac, bleached.....2 ounces av.
Borax, crystal.....1 ounce av.
Water.....16 fluidounces.

Rub up the shellac and borax together in a mortar until reduced to a fine powder; then place the mixture in an enameled vessel and add the water; apply heat, and boil the whole together until the mixture begins to foam, when it is removed from the fire and allowed to cool. The boiling process is to be repeated until all the shellac is finally dissolved. When cold the solution is to be strained through fine cheese-cloth, and constitutes the vehicle for the pigment, sufficient Frankfort black or lampblack being stirred in, together with a little finely powdered indigo to produce a bluish or jet-black color.

A variety of colored inks may be made by the addition of various pigments. A thoroughly smooth mixture should be made of the pigment with the liquid.

If a glossy ink is desired, yellow dextrin should be added in the proportion of 1 to 4 ounces av. of dextrin to 16 fluidounces of ink.

This makes a good black show-card ink:

Asphaltum.....4 ounces av.
Venice turpentine.....2 ounces av.
Lampblack.....1 ounce av.
Oil of turpentine.....16 fluidounces.

Dissolve the asphaltum and Venice turpentine in the oil and with this solution thoroughly incorporate the lampblack.

Rubber Stamp Ink.

A. P. L.—In order to make the ink directed below, first prepare an oil mixture, as follows: Oleic acid purified, 5 parts; castor oil, 53 parts. Mix thoroughly.

Black Ink.—Oil mixture, 300 parts; oil-soluble black, 15 parts. Proceed as directed above.

Blue Ink.—Oil mixture, 300 parts; oil-soluble blue, 15 parts. Heat the oil mixture on a water-bath to blood temperature. Shave the color into small pieces, and stir it into the oil mixture until it is completely dissolved. Let stand for twelve hours, and then strain through a double thickness of cheese-cloth.

To make a glycerin stamp ink take: Aniline water blue, 1 B, 3 drachms; distilled water, 10 drachms; acetic acid, 2 drachms; alcohol, 1½ ounces; glycerin, enough to make 10 ounces. Make a solution by rubbing in a mortar. In the same way, inks of the following colors may be prepared with the above compound menstruum, substituting, of course, the pigment named for the aniline water-blue in the formula given: Violet—Methyl violet (3B), 2 drachms. Red—Diamond fuchsin (1), 2 drachms. Green—Aniline green

(D), 4 drachms. Brown—Vesuvine (B), 5 drachms. Black—Deep black (E), 3 drachms. For bright-red, omit the acid from the solution, replacing it by water, and using 3 drachms of eosin.

Safety Matches.

A. C. M. wants the formula of the substance used on the box of safety matches for striking and igniting the matches.

Here is a formula for both safety match and box. Dip the splints in a paste composed of chlorate of potash, 6 parts; sulphide of antimony, 2 to 3 parts; glue, weighed dry, 1 part. The paste for the rubbing surface is amorphous phosphorus, 10 parts; oxide of manganese, or sulphide of antimony, 8 parts; glue, 3 to 6 parts, weighed dry. The ingredients must be thoroughly mixed, and care must be taken not to mix the chlorate of potash in the dry state with the other materials; it should be mixed first with glue dissolved in warm water. The paste for the rubbing surface may be spread with a brush or spatula on the side of the box.

An Iodine Collodion.

W. M. B. requests us to criticize the following prescription:

Tincture of iodine,
Strong ammonia water,
Collodion, aa.....1 ounce.

Mix. Signa: Paint over seat of pain.

Collodion is incompatible with aqueous fluids, a heavy precipitate being thrown down. Spirit of ammonia should be used in place of the water. The ammonia water in this mixture does not decolorize the iodine. The prescription remains clear but retains the color of iodine.

Cockroach Powder.

W. K. F.—A mixture of the following substances strewed around the places infested will, it is said, drive away the pest: 2 parts naphthalin, 200 parts powdered angelica root, 50 parts melilot, 5 parts oil of eucalyptus.

Good insect powder is recommended. Sulphur is also used.

The subject of ant exterminators was treated at considerable length on page 306 of the July BULLETIN for this year.

Imperial Shampoo.

E. B. wants the formula for Cooban's shampoo.

Several shampoo formulas have been contributed to the BULLETIN by B. S. Cooban, including the following:

Tincture of green soap.....4 fluidounces.
Salts of tartar.....2 drachms.
Oil of bergamot.....20 drops.
Water, enough to make.....2 pints.

Mix and let stand two or three days, then filter.

This is Mr. Cooban's own preparation. He puts it up in six-ounce Paris square bottles with sprinkle tops, and sells it at 35 cents a bottle. The label is lithographed in plain black on a white ground. Tincture of Green Soap (U. S. P.) is used a great deal as a shampoo, diluting it as needed; glycerin may be added if desired.

Vanilla Extract.

C. N. H. asks: "What is the method used by large manufacturers of flavoring extracts for the preparation of a pure vanilla extract?"

Cut the vanilla beans into small pieces and macerate them six months or more in a tank or barrel. Then siphon off the extract and drain the drug. Wash the residue with a menstruum and use this liquid in making the next lot. We have not given a formula since you have asked merely for the method. But if you desire specific information about the strength of the ingredients, consult the official recipe of tincture of vanilla in the Pharmacopœia.

While we do not know of any book devoted to the manufacture of flavoring extracts, any number of recipes can be found in the literature. The Spatula Soda Water Guide gives several formulas of this character, and doubtless others can be found in any of the formula books on the market.

A Difficult Pill.

J. J. B. wants to know how to make a pill of the following formula:

Silver nitrate.....4 grains.
Powdered extract of hyoscyamus....10 grains.
Powdered extract of nux vomica.....4 grains.
Purified ox gall.....20 grains.

Mix and make 20 pills.

First make a mass of the silver nitrate by incorporating it in petrolatum, or better a mixture of petrolatum and paraffin. Then make another mass of the remaining ingredients and incorporate it carefully with the silver nitrate mixture. Avoid the use of water as the silver nitrate is prone to decompose in the presence of moisture, while it should be comparatively unaffected by fats.

An Unsightly Mixture.

A. P. S. wants to know what causes the incompatibility in the following prescription. He complains that it gets soft, turns pink, and finally black in a few hours:

Sodium chloride.....3 drachms.
Sodium bicarbonate.....6 drachms.
Sodium sulphate.....7 drachms.
Sodium salicylate.....½ ounce.
Phenolphthalein.....20 grains.
Oil of gaultheria.....20 drops.
Oil of cinnamon.....10 drops.

Mix and make powder.

The phenolphthalein in contact with sodium bicarbonate gives a pink color, as always happens when this indicator is added to an alkali. The sodium salicylate darkens in the presence of alkali, as does also the cinnamon oil.

Interstate Reciprocity.

F. B.—It would be impracticable to give you a list of the State boards of pharmacy which exchange certificates with the Missouri Board for the reason that many of the boards are constantly changing their rules and regulations. The best thing you can do is to write the secretaries of the boards of those States in which you are particularly interested, and ask them whether or not they exchange with Missouri. You will find a full list of the board secretaries of the country on page 306 of the July BULLETIN.

Worm Powders, Veterinary.

E. C. M.—Here are several formulas for worm powders for veterinary use:

- (1) Santonin10 grains.
Calomel15 grains.
Scammony resin, powdered.....15 grains.
Powdered sugar.....30 grains.

Mix and divide into 15 powders. Give one three times daily on an empty stomach for one day, and repeat in three days if necessary.

- (2) Santonin10 grains.
Podophyllin resin.....4 grains.
Powdered rhubarb.....15 grains.
Sugar of milk.....30 grains.

Mix and divide into 15 powders. Give the powders five hours apart on an empty stomach until three have been given. Omit a day, repeating the dose if necessary.

- (3) Calomel.....3 grains.
Santonin.....¼ grain.
Powdered rhubarb5 grains.

For one powder.

Liquid Wash Bluing.

W. H. W.—Pulverize 8.3 parts of solid indigo in a porcelain dish, and add 33 1/3 parts of sulphuric acid. Let this stand for six hours with frequent stirring with a wooden or glass rod, and pour it into a flask containing one-half gallon of water, not too cold. Drop powdered chalk into the flask until effervescence ceases, in order to remove the sulphuric acid, which is injurious to the clothes. The whole is then allowed to stand quietly for a few days, then filtered through blotting-paper, and can be kept for years without fear of spoiling.

Glycerite of Iron Chloride.

G. V. L. wants a formula for glycerite of iron chloride.

We suggest the following preparation:

- Solution of iron (ferric) chloride.4 fluidrachms.
Citric acid.....80 grains.
Glycerin13 fluidounces.
Ammonia water.....sufficient.
Distilled water, to make.....16 fluidounces.

Mix the solution with the glycerin, dissolve the acid in 1 fluidounce of water, mix the two liquids, and then add ammonia water, gradually, with constant stirring, until the liquid is but feebly acid. The latter will require about 1 fluidounce. Then dilute with water to 16 fluidounces.

If twice as much acid be employed, the liquid will be greenish instead of brown. Each fluidounce of glycerite is equivalent to 1 fluidrachm of tincture of ferric chloride.

Elixir Lactated Pepsin, 80 Grains.

J. K. wants a formula for Elixir Lactated Pepsin, 80 grains.

It is only necessary to use the N. F. formula, making due modification to raise the content of lactated pepsin. The following preparation has 80 grains of lactated pepsin in each fluidounce of elixir:

- Pepsin, U. S. P.....20.5 grains.
Pancreatin, U. S. P.....20.5 grains.
Diastase20.5 grains.
Lactic acid, U. S. P.....11.0 grains.
Hydrochloric acid, U. S. P.....20.5 minims.
Glycerin11 fluidounces.
Water.....5.5 fluidounces.
Tincture cudbear, N. F.....5.25 fluidrachms.
Purified talc, U. S. P.....5.25 drachms.
Aromatic elixir, U. S. P., enough
to make.....32 fluidounces.

Mix the glycerin, water, and the acids; add the pepsin, pancreatin, and diastase, and macerate with occasional shaking until solution is apparently effected. Then add the tincture of cudbear and enough aromatic elixir to make 32 fluidounces. Incorporate the purified talc and filter.

Gasoline Cleaning Liquids.

A. E. M. wants a formula for a "dry" cleaning compound containing gasoline. The following liquids are found in the literature:

- (1) Chloroform.....4 fluidounces.
Ether.....1 fluidounce.
Oil of bergamot.....2 fluidrachms.
Gasoline, to make.....32 fluidounces.
(2) Alcohol5 fluidrachms.
Chloroform5 fluidrachms.
Oil of sassafras.....5 fluidrachms.
Gasoline or benzin.....32 fluidounces.
(3) Ether1 fluidrachm.
Chloroform1 fluidrachm.
Ammonia water.....1 fluidrachm.
Oil of wintergreen.....1 fluidrachm.
Alcohol.....1 fluidounce.
Gasoline, to make.....32 fluidounces.

Marble Polish.

G. L. W.—Mr. W. C. Durkee (Boston) gives the following formula for a marble dressing or polish:

- Pure beeswax.....10 parts.
Japan gold size.....2 parts.
Spirits of turpentine.....88 parts.

The mixture is of creamy consistence, and should be applied in small quantities, with the aid of a piece of white flannel. If it is desired for use upon white marble, white wax may be substituted. The same preparation can be used to advantage on woodwork. The Japan size prevents the stickiness which exists when wax alone is used.

Suppositories Losing Weight.

C. J. H. asks: "Why do suppositories of hydrastine hydrochloride, zinc borate, extract of belladonna, and oil of theobroma lose a half of their weight and volume on standing. Apparently the cacao butter has been dissipated; but the suppositories have not been subjected to special heat at all."

Cacao-butter suppositories made according to the foregoing formula will not decrease in weight unless the wrapped suppositories be exposed to a high temperature. Then part of the melted cacao butter may run out, and the remaining portion assume the shape of the wrapper when the mass becomes cool.

Nail Ointment.

F. M. H. wants a preparation that will stop finger-nails from cracking and splitting.

Try this:

- White petrolatum.....4 ounces av.
White Castile soap, powder.....½ ounce av.
Oil of bergamot or other perfume....sufficient.

This is used for softening the nails, curing hang-nails, etc. It is to be applied at night, the fingers being covered with gloves.

Sodium Silicate or Water-glass.

W. A. M. wants a formula for making sodium silicate, commonly called water-glass, for the preservation of eggs.

Sodium silicate, Na₂SiO₃, is made up by fusing at high heat 100 parts of anhydrous sodium carbonate and 56.6 parts of powdered quartz (SiO₂). By dissolving the mass in water and concentrating, crystals of the salt may be obtained, which when redissolved in water give a solution of so-called water-glass.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., OCTOBER, 1911.

No. 10.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

E. G. SWIFT, PUBLISHER,

Corner Joseph Campau Ave. and Atwater St., DETROIT, MICH.

EDITOR: HARRY B. MASON, PH.G.

ASSISTANT EDITOR: JOHN HELFMAN, B.S. PHAR.

BUSINESS MANAGER: HARRY SKILLMAN.

SUBSCRIPTION RATES:

United States and Mexico,	. . .	\$1.00 per year
Foreign countries,	. . .	1.50 per year

Box 484, DETROIT, MICH.

All business letters should be addressed:

PUBLISHER BULLETIN OF PHARMACY,
Box 484, DETROIT, MICH.

THE MONTH'S HISTORY

WILEY-RUSBY MATTER SETTLED.

Things seem to have been remarkably quiet lately on the pharmaceutical Potomac.

Nothing of any particular importance has transpired to awaken the interest or even disturb the dreams of the drug trade. Of course the event of last month was the annual meeting of the N. A. R. D. at Niagara Falls, and of that convention we are giving an editorial summary on other pages. Outside of this, there has been only the Wiley situation to keep us interested, and even that is not likely to loom very large now for some months until the congressional investigating committee renders its report in December.

So far as the immediate issues are concerned, President Taft settled them by his decision two or three weeks ago. As everybody knows long before this, the President exonerated both Dr. Wiley and Dr. Rusby.

He declared that while the strict letter of the law would have prevented such an agreement as was made with Dr. Rusby, there was abundant precedent in the establishment of the Remsen Board several years ago, not to mention a number of other specific instances. Furthermore, Dr. Wiley was not a party to the letters written by his assistants, Bigelow and Kebler, while Dr. Rusby knew nothing of the legal difficulties connected with his employment. He merely accepted what the government officials offered him. It was their fault, not his—if there were any fault at all.

President Taft, however, suggested that Bigelow and Kebler displayed what he called "over-zeal" in their apparent desire to make the law square with the particular agreement made with Dr. Rusby. The President therefore declared that they should receive a reprimand from Secretary Wilson. Other than this no punishment was meted out to any of the four individuals involved in this nine-day sensation. As a matter of fact, President Taft seemed to look upon the whole imbroglio as being "trivial." He declared that more serious things were uncovered in the congressional investigation, and he intimated that when the Congressional Committee has reported, it may be found necessary to have some sort of a house-cleaning in the Agricultural Department.

* * *

APROPOS OF DR. RUSBY.

This whole situation has been exceedingly unfortunate, particularly so far as Dr. Rusby is concerned. The yearly amount paid to Dr. Rusby was far too small to reward the services of a man of his position and character, and it was the height of injustice to have him subjected to the least criticism for accepting it. The President exonerated him, however, with a fulness which must have given pleasure to all of Dr. Rusby's numerous friends, while very little was said about one other charge made in the original complaint of the Committee on Personnel of the Agricultural Department. Regarding this,

President Taft believed that Dr. Rusby was scarcely justified in having placed on the laborer's pay-roll an expert who could do his work for him during his absence at a small stipend.

Beyond mildly criticizing Dr. Rusby for this, however, President Taft distinctly stated that nothing more should be said and that Dr. Rusby's valuable services should by all means be retained. We venture to believe that even this gentle discipline would not have been meted out to Dr. Rusby if President Taft had known him as well as those of us do who are closer to the man and to his work. Everybody realizes that Dr. Rusby would rather cut off his right hand than do a single thing which would not square with every last principle of honor and duty. In matters of judgment we ourselves are not always able to agree with Dr. Rusby. We have frequently found ourselves opposed to him on one question or another. He is no more infallible than Dr. Wiley or any of the rest of us. But he is square. He is honor itself. We happen to know that time and time again he has made large financial sacrifices in order to be true to his sense of duty to the pharmaceutical profession.

Of course in a congressional investigation, when everybody concerned is jockeying for position, and is trying to get something on the other fellow, things are said and intimated which look bad when subsequently interpreted or misinterpreted in the newspapers. The readers of the daily press may therefore have jumped to wild conclusions regarding Dr. Rusby's connection with the government service. Several acts or alleged acts have now and then been mentioned which could easily be made to look bad when improperly presented to the reading public. But no one who knows Dr. Rusby needs the assurance that the man would never do anything consciously which was in the least degree questionable. His judgment may be fallible, but his character is beyond reproach.

* * *

CONCERNING DR. WILEY.

In all this turmoil over the Wiley incident, indeed, there has been a good deal of misstatement and misunderstanding. So far as Dr. Wiley is concerned, we agree with neither those horrid "interests" which are said to be after his scalp, nor with the hero worshipers

who would make a saint out of their doughty champion. There is no doubt at all that Dr. Wiley is a man of incorruptible honesty. He is a man who has dedicated himself heart and soul to the public health and the public welfare. He never fails to perform his duty as he sees it, and he is willing to make any personal sacrifice, financial or other, to do what his conscience dictates. There are too few of such men in public office, and we would regard it as little less than a calamity if Dr. Wiley were to be removed. The country needs him.

But Dr. Wiley is not without faults. His chief offense is that he believes himself to have a monopoly of the truth, and that any one who disagrees with him is not only wrong but is probably crooked. He is a radical. He has a marked tendency to take extreme, even indefensible positions, and then to impose his judgment on everybody else roughshod. Left alone, he would unwittingly do quite as much harm in some directions as he would intentionally do good in others.

Dr. Wiley's superiors in office have realized this defect in the man and they have sought to correct it. They have endeavored to preserve what is good and to prevent what is bad. Thus President Roosevelt appointed the Remsen Board of expert chemists primarily to investigate the sodium benzoate matter and to see whether Dr. Wiley was right on that question or not. A little later on—perhaps, indeed, it was before that—Secretary Wilson appointed the Board of Food and Drug Inspection in order that all matters having to do with the enforcement of the food and drugs act should be determined by three heads instead of one. Later still President Taft found it necessary to make a personal investigation of the whisky imbroglio, and his decision amounted practically to a reversal of Wiley's dictum.

* * *

THE NUB OF THE QUESTION.

Dr. Wiley, conceiving himself to be right on every question, has, it now seems, bitterly resented all these restrictions on his authority. He practically told the Congressional Committee that the food and drugs act had been nullified because his hands had been tied, and in effect he made a plea for greater and more untrammelled power. It may be that the Committee will recommend some such

change when it reports to Congress next December. We do not know.

At any rate, it is our opinion that Dr. Wiley has been surrounded with checks because his superiors have found them necessary, and not, as the newspapers and popular magazines would have us think, because the "interests" have been camping on his trail. Early in the enforcement of the food and drugs act, while he was still supreme, he made several rules and regulations which have since been flouted by the courts—even by the Supreme Court of the United States. His attitude on the sodium benzoate question was found to be wrong by five able, impartial, and wholly disinterested chemists. His attitude on the whisky matter was reversed by a man of no less character and judicial experience than President Taft himself. It would be a far cry to suggest that these men have represented the "interests."

The truth is, no man in the country is big enough and broad enough to be a dictator. Why do we have a supreme court of nine members, and why do these men so often disagree with one another? No one mind can always find the exact truth, and no single man should be placed in a position of authority where he can impose erroneous judgments on the country. It is no discredit to Dr. Wiley that he has been made to do team work with others. So far as his judgments have been sound, they have undoubtedly been supported by others who have shared authority with him, and it is much better to have an important law enforced by an impartial commission of three or five or seven men than by one man alone. This, it seems to us, is the nub of the whole controversy.

We need Dr. Wiley. He is a man of great zeal and great ability. He ought to be kept in office—and there is little doubt that he will be. But no one, Dr. Wiley or anybody else, ought to be given the rights and privileges of a dictator, and in the enforcement of our laws we should follow the methods of the Supreme Court rather than those of the Russian autocracy.

* * *

BUGABOO OF THE "INTERESTS."

Of course it is true that the "interests" as represented by some of the big food manufacturers have been systematically attempting to discredit Dr. Wiley and if possible to have

him ousted from the government service. They properly look upon him as an enemy, but if their efforts were to succeed it would certainly be a public disgrace. We have no patience at all with their point of view. But nevertheless it is not because of them that Dr. Wiley has been shorn of some of his single-handed authority, nor because of them that the Wiley-Rusby incident developed. The latter seems to have been the result of an inter-departmental warfare—a little inside jealousy. The food manufacturers have seized upon it with avidity, but they were not the cause of it—although we shall be reading in the popular magazines now for several months that they were.

As for the interdepartmental differences disclosed by the Congressional investigation, they are rather serious in character and President Taft pays his compliments to them in the decision rendered in the Wiley case. He intimates that something like a house-cleaning may be necessary in the affairs of the Agricultural Department, and he asserts that he may take some definite action as soon as the Committee has rendered its report to Congress next December. Personal jealousies and bickerings ought not to be permitted, and a harmonious organization should be developed in the interests of public effectiveness.

That there is room for improvement in the machinery of enforcing the food and drugs act we are quite willing to believe, but we hold that the principle should be retained of having all important questions settled by a board or commission of several men instead of by one man.

* * *

**H₂O₂ MAY BE
SOLD BY
ANYBODY.**

We learn from the *National Druggist* that the Ohio Board of Pharmacy recently issued an order prohibiting everybody except licensed pharmacists from selling hydrogen peroxide, on the ground that it was primarily a pharmaceutical preparation. A warning was sent to grocers, department stores and others that if they continued handling the article they would be prosecuted. The merchants, however, protested, insisting that hydrogen peroxide was non-toxic and that the restriction of its sale to druggists would be a hardship upon consumers and an injustice both to them and to general dealers. The board of pharmacy asked the Attorney-General of the

State for an opinion on the law as applying to this article, and he has replied that, under the Ohio pharmacy law, hydrogen peroxide is to be classed as a household remedy, which can be sold by others than registered pharmacists.

This opinion, remarks our contemporary, is in line with a decision rendered by a judge in New York less than a year ago, and confirmed by the Appellate term of the State Supreme Court, in the case of the New York Board of Pharmacy against E. W. Woodworth & Co., a department store firm. In this case the court held that the pharmacy law was in the nature of a police regulation, the primary object of which was to protect the public against incompetence and ignorance in the compounding of medicines which are prescribed by physicians. Hydrogen peroxide, however, was sold in original packages, and in such manner that the public would not be better protected if its sale were confined to pharmacists than when sold by other dealers; and, further, as the article was used for purposes other than medicinal, it did not appear to the court that the sales thereof by others than licensed pharmacists could be prohibited.

Hydrogen peroxide has become an article of such general use by the public, as a disinfectant and for the toilet, and the opinions mentioned above seem to be so strongly fortified, that they may as well be acquiesced in by pharmacists, especially as it is very likely that they will be followed by the legal authorities in other States in which the question may be brought up. The thing for pharmacists to do is to sell a superior product and get the business away from general dealers who handle cheap stuff of very little if any value.

* * *

THE HYDRASTIS AND OPIUM SITUATION.

Golden-seal is becoming very scarce. In their desire to get the drug, diggers have been gathering old roots early in the spring before the new roots for the next year's growth were formed. This resulted in diminishing the normal supply. And unless efforts are made to conserve the plant, the next five years will see an end of golden-seal. Something must be done to correct the prodigal wasteful methods now employed in its collection. The Bureau of Plant Industry in the Department of Agriculture has been making a very energetic attempt to induce people to

start in the cultivation of this expensive drug with seemingly indifferent success. There is no question about the profit in it. The price just now is \$4.25 a pound. Considering the comparative ease of growing golden-seal, the man who owns five acres can profit by planting it. Drug houses who formerly bought golden-seal by the ton to-day entertain offers of 25 pounds. Think of it.

The opium situation is also very tight. The restriction of poppy cultivation in China is having its effect. The Chinese government is curtailing not only the use but the growth of opium. Farmers in China have been forced to reduce their output of opium or even desist entirely from growing the drug. This year the crop is estimated at 3000 cases where the normal supply is 9000. As a result the price is extremely high.

The normal quotation under the present duty, which, by the way, is fifty cents higher than formerly, should be from \$3.65 to \$3.85 a pound for U. S. P. gum. Instead the price is in the neighborhood of eight dollars a pound, and no one knows how high it will soar. Morphine has advanced over a third. Codeine has advanced a half. Fluid extracts, tinctures, and all opium products have increased. This is owing to no speculative interference. The advance is due to natural causes. But should a speculative element enter into the opium trade, there is no telling where the price will go. The market quotation is already the highest in thirty years. Unfortunately the yield, already small, has not been conserved entirely for medicinal use. Large quantities of opium are being smuggled into China for illegitimate sale to habitués of the drug.

Then, too, Turkey has had the severest winter in its history. It wrought havoc with the opium crop, killing two-thirds of the plants. Poppy cultivation is very delicate. The plant is so easily affected. It is sown in the fall and a drought or hard dry spell following the sowing prevents the plant from getting a rooting that will sustain it through the winter. Then, again, a hard frost before snow covers the ground is fatal. And when spring comes if a dry season prevails the crop is affected 50 per cent. Worst of all, if it rains when the juice is being gathered, much is washed away. Thus it is seen that from the sowing till the gathering, the opium plant

has one continual struggle for life. And during the past year it has had an unusually precarious existence with a consequent diminution in the crop.

* * *

THE PUBLIC DRINKING CUP.

The movement against the public drinking cup is growing rapidly. Laws were enacted in several States during the past winter, and the Illinois statute is a fair example of the others. This prohibits the use of common drinking cups in schools, public halls, hotels, lodging houses, theaters, factories and State or municipal buildings. The Attorney-General has ruled that cups may still be legally used in places not specifically mentioned in the law—banks, barber-shops, saloons, stores, restaurants, public parks, factories, etc.

In some of the city ordinances and State laws the list of interdicted places is more lengthy, and in any event it is the duty of everybody to fall in line with a movement of this kind which means so much to the public health. For there is no doubt that the most serious diseases are spread by the use of the public drinking cup. So thoroughly is this realized by those who have studied the question that in a few years we may expect to see people shunning a common drinking cup as they would the plague.

Already the public has been pretty well educated by the installation of sanitary drinking fountains in most of the public parks throughout the country—those ingenious spouting contrivances which throw a jet of water up into the air so that one with a little practice may catch it in his mouth without the necessity of using a cup at all. Many druggists have seized upon the opportunity to sell aseptic paper cups, and the Editor of the BULLETIN, while traveling through the East this summer, found himself able to purchase these cups at several pharmacies. They are inexpensive, very convenient, folding in character, and any druggist can work up a nice sale on them with a little care and attention.

* * *

DEATH OF LOUIS ROSENHEIN.

Most unfortunate was the sudden death last month of Mr. Louis Rosenhein, the secretary and treasurer of the Live and Let Live Drug Co. of Chattanooga. Mr. Rosenhein had been suffering from a valvular heart trouble for several years, but the startling

suddenness of his death was none the less grievous. He had been at the store nearly all day. At 10 o'clock in the evening he stepped out of a cab, was suddenly seen to stagger, entered the store with difficulty, and was assisted by one of his clerks into the rear room. A physician was at once sent for, but death resulted before he could reach the store. Every employee of the company was unnerved by the incident, for each of them held Mr. Rosenhein in profound regard and respect. Born in Hungary in 1864, he had come to America at an early age, and had made himself a very able and successful business man. He had been secretary and treasurer of the Live and Let Live Drug Co. for about fifteen years.

* * *

PHILADELPHIA AGAIN.

Another mild sensation broke out in Philadelphia not long ago. We have grown accustomed to look to the Pennsylvania Board of Pharmacy for something dramatic when things get quiet elsewhere. This time the Board has caused the arrest of a number of paint dealers in Philadelphia on the charge of selling poisons without complying with the provisions of the pharmacy act and similar statutes. Something like 50 or 75 of these men have been jumped on. Of course they are angry and they have threatened reprisal. They look upon this as an attempt of the drug trade to wreak vengeance upon them for their competition in the sale of chemicals, and they have threatened to get square. It was rumored some time ago that they had even employed a detective to get something on the druggists. The Philadelphia Association of Retail Druggists thereupon concluded that the pharmaceutical house ought to be put in order, and so a warning was sent out to every member to respect the poison, anti-narcotic, and carbolic acid laws to the very letter.

* * *

PRESCRIPTIONS A CURIOSITY!

It has from time to time been asserted by druggists that the prescription business is largely getting to be a thing of the past. Most of our readers, however, will hardly be prepared for the conditions as they apparently exist in Denver. At the Boston meeting of the A. Ph. A. in August a paper was presented by Chas. M. Ford, the well-known druggist of Denver, and at the present time the drug inspector of the State. Mr.

Ford declared that there were fifty drug stores in Denver, and two hundred and eleven persons employed in them, of whom eighty-four were registered pharmacists. In these fifty stores there were only three hundred and four prescriptions dispensed daily on an average. This left out of account, however, a group of five or six stores under one management which were said to do a large prescription business. Mr. Ford thought that the three hundred and four prescriptions dispensed in the fifty stores mentioned in the paper, could easily be compounded in ten stores with much greater economy of effort. This prescription showing for Denver is certainly a poor one, and it is interesting to note that Mr. Ford largely ascribed the conditions to the growth of osteopathy, Christian Science, and other cults dealing in drugless measures.

* * *

CO-OPERATION IN CINCINNATI.

A novel scheme of coöperative advertising and selling has been worked out among fifty or more druggists in Cincinnati. In order to compete with the big down-town dealers these men have decided to carry on an aggressive advertising campaign. They purchase space in one or more of the leading dailies and on Saturdays offer cut prices on seasonable goods and sundries. At the bottom of each ad. is a list of the druggists represented in the group. They call themselves the "Economy Drug Stores," and "Economy" signs are used inside and outside of every establishment in order to connect the stores with the advertising. The electric signs outside are gold lettered and are 3 by 8 feet in size. The whole scheme is certainly novel, and it will be exceedingly interesting to see how it works out.

* * *

NO CHAIN-STORES FOR CHICAGO?

We learn from the *N. A. R. D. Notes* that one of the eastern chain-store syndicates has recently been considering the advisability of establishing a group of stores in Chicago. A representative looked over the ground, inserted a few newspaper advertisements in search of store managers, collected data of one kind and another, and then decided to abandon the scheme. The *Notes* says that the easterners found the drug trade of Chicago so well organized as to make the city an unpromising field.

EDITORIAL

THE MICHIGAN POISON CORK LAW AND ITS COMPLICATIONS.

The drug trade of Michigan is very much disturbed over a law which was juggled through the Michigan legislature last winter, and which no one knew anything about until the mischief had been done. It declares that all containers with poisons in them must be provided with serrated corks approved by the State Board of Health. Similiar measures are introduced from time to time in the different legislatures, and it behooves pharmacists to be on the lookout for them. Several made their appearance last winter, but all of them except the Michigan bill were discovered in time and were given their quietus. Apparently the "interests" behind these measures are the manufacturers of the serrated corks themselves, and they seem to be adepts in gum-shoe methods, for no one in the drug trade knew anything of the Michigan bill until a week or two after the legislature had adjourned and the governor had signed the law.

Here is the Michigan bill in its entirety:

SECTION 1. It shall be unlawful after November first, Anno Domini nineteen hundred eleven, for any person, firm, or corporation doing a retail or wholesale business, or any agent, clerk or employee, to sell or dispose of, or offer to sell or deliver to any person any poison or any substance generally denominated as poisonous, unless the cork or stopper of the bottle or receptacle containing such poison or poisonous substance shall have fitted thereon a wood, celluloid, glass or metal disc, with serrated edge sufficient to call attention to the fact, either in daylight or in darkness, that the contents of the bottle or receptacle, the stopper or cork of which is fitted with such device, contains a poison or poisonous substance. The words "poison" or "poisonous substance" as used in this act shall be construed to include only the poisons or poisonous substances referred to and included within the terms of the schedules and language of section twenty-three of act number three hundred thirty-two of the public acts of nineteen hundred five. It shall be the duty of the State Board of Health, within thirty days after this act shall take effect, to approve of such a device or appliance as shall meet the requirements of this act and a sample thereof shall be kept in its office in the city of Lansing. The said State Board of Health shall immediately after the approval of such device or appliance, forward to every wholesale or retail druggist in this State, or to any other person upon request, a sample of the device or appliance so approved. The cost of all samples of such devices and appliances so approved by the State Board of Health, and by this act required to be furnished or issued by the State Board of Health, together with the cost of

delivering same, shall be paid by the Board of State Auditors out of the general fund in the State treasury, on presentation of vouchers approved by the secretary of the State Board of Health. It shall be unlawful for any person, firm or corporation, or employee, agent or clerk, to use, authorize or cause to be used upon such cork or stopper any appliance or device unless same has received the approval of the State Board of Health, or to use, authorize or cause to be used any such appliance or device above mentioned on any other bottle or receptacle than those hereinabove provided for. Any person violating the provisions of this act shall upon conviction thereof be punished by imprisonment not less than three months nor more than one year, or by a fine not less than ninety dollars, or not to exceed three hundred dollars, or both such fine and imprisonment in the discretion of the court: Provided, That each such sale or delivery contrary to the provisions of this act, shall constitute a separate offense: Provided, That nothing in this act shall apply to poisons sold in packages or receptacles not fitted with a cork or stopper.

It will be seen that the substances to be considered as poisons under this law are those mentioned in Schedules A and B of the pharmacy act. Section 23 of this act reads as follows:

SEC. 23. It shall be unlawful for any person or persons licensed under the provisions of this act to sell at retail or furnish any of the poisons named in the schedules hereinafter set forth without affixing or causing to be affixed to the bottle, box, vessel or package a label containing the name of the article and the word poison distinctly shown, together with the name and place of business of the seller all printed in red ink, and the name of such poison printed or written thereupon in plain legible characters, except when sold in the original package of the manufacturer, which conform to the requirements for the wholesale dealers, as hereinafter set forth. The following are the schedules:

SCHEDULE "A."

Arsenic, cyanide of potassium, hydrocyanic acid, strychnine, and all poisonous alkaloids and their salts, oil of bitter almonds containing hydrocyanic acid, opium and its preparations, except paregoric and such others as contain less than two grains of opium to the ounce.

SCHEDULE "B."

Aconite, belladonna, cantharides, colchicum, conium, cotton root, digitalis, ergot, hellebore, henbane, phyto-lacca, strophanthus, oil of tansy, veratrum viride and other pharmaceutical preparations, arsenical solutions, carbolic acid, choral hydrate, chloroform, corrosive sublimate, creosote, croton oil, mineral acids, oxalic acid, Paris green, salts of lead, salts of zinc, white hellebore, or any drug, chemical or preparation which, according to standard works on medicine or materia medica, is liable to be destructive to adult human life in quantities of sixty grains or less.

It would seem from the first sentence of the new cork law that retailers and wholesalers are affected. Manufacturers apparently are

not involved, and there seems little reason why jobbers should be. Very few of the poisons sold by jobbers to the retail trade are passed along to the consumer in original packages, so that little is to be gained by insisting that the jobber observe such a law. If he is made to do it, and if he must restopper, for instance, every eighth-ounce bottle of morphine which he receives from the manufacturing chemist, he is going to be subjected to a tremendous amount of annoyance for which there is no warrant at all. Furthermore, if the jobber breaks open such a package, and puts in a cork of his own, is the retailer going to be satisfied that he is getting the Simon pure chemical turned out in the first instance by the manufacturer?

It is possible that this bill, annoying and unnecessary as it is, may not cause the retailer any particular hardship or inconvenience. Whenever he sells two or three ounces of carbolic acid, he must put the substance in a bottle and provide the bottle with a cork. To conform to the law he need only in addition slip over the cork one of the two serrated contrivances which have been approved by the State Board of Health. But it is an entirely different problem with the jobber. Thousands of packages in his stock are affected, and if he is made to provide them all with such corks he will be subjected to an amount of red tape which is simply stupendous. Even the jobbers of Chicago are worried over the bill. Technically it does not affect them, since their shipments into Michigan territory come under the head of interstate commerce not reached by any State act, but in practice they fear the Michigan retailers will not buy poisons of them in competition with the local wholesalers unless the packages are provided with the approved corks.

A. L. Walker, a well-known retailer and student of pharmaceutical legislation, believes that there is a loophole in the law which will permit the jobber to escape. The second sentence of the act reads as follows: "The words 'poison' or 'poisonous substances' as used in this act shall be construed to include only the poisons or poisonous substances referred to and included *within the terms of the schedules and language* of section twenty-three of act number three hundred thirty-two of the public acts of nineteen hundred five." Turning now to the "terms" and "language"

of section twenty-three of the latter act, we find that original packages of the manufacturer are not involved, and Mr. Walker holds that this exemption applies as much to the cork law as it does to the poison law. He believes that the packages which escape the labeling provisions must also escape the cork provision, since reference is made in the cork law "to the *terms* of the schedule and *language* of section twenty-three." This is a fine point in law, and it remains to be seen whether it will be supported or not. The Attorney-General of the State is on record to the contrary. Of course if original packages are exempt, the jobber is practically outside the law, for he deals in original packages for the most part.

The statute will undoubtedly be repealed at the next session of the State legislature, but this can unfortunately not result yet for a year and a half, and in the meantime the retailers and jobbers of Michigan are deserving of much sympathy.

PHYSICIANS AND THE ANTI-NARCOTIC LAWS.

We have had more or less to say in this journal about the relations of physicians to the anti-narcotic laws of the different States. It has frequently been asserted by others that these laws could be practically nullified by the illegitimate acts of physicians in prescribing narcotics *ad libitum*. But we have always striven to show that physicians could be punished for this sort of thing just as much as pharmacists could for open violations of the law. Quite often we have cited instances where physicians have been convicted. Several cases of this character are now pending in Pennsylvania, and in particular one case in Philadelphia has attracted a good deal of attention.

We observe that out in California the State Board of Pharmacy is getting after two physicians pretty vigorously. The California statute contains the customary provision prohibiting physicians and dentists from prescribing narcotics for the use of habitués, and because the Board is enforcing this section of the law a good deal of protest has apparently resulted from some members of the medical profession. The *California State Journal of Medicine*, however, which is the official organ

of the State Medical Society, strongly takes its stand in support of the Board of Pharmacy. The *Journal* declares that one licensed physician in the State, and a member of his county medical society, has been found to be signing narcotic prescriptions in blank and leaving them at some drug store so that the pharmacist could fill them out at will and thus make a show at conforming to the law. Proceedings have been brought against several physicians, and in most instances the latter have pleaded guilty and paid fines.

It is more or less common for a conscienceless physician to work in league with an equally conscienceless druggist to defeat the anti-narcotic law, but the State Board of Pharmacy in California is showing that this sort of thing won't wash. More power to its elbow!

PROFITS AND EARNINGS

AN ASTONISHING RATE OF PROFIT.

We have received from a druggist who signs himself "Minnesota" the following annual statement of his business, requesting that we analyze and comment upon it:

Cash sales.....	\$7596 70
Book accounts—all good.....	515 96
Goods purchased.....	4190 19
Expenses	1136 97
Cash discounts.....	73 71
Bills payable.....	355 47
Proprietor drew from business....	2246 95
Cash on hand, 1-1-11.....	70 25
Cash in bank, 1-1-11.....	493 70
Stock on hand, 1-1-11.....	2861 04
Fixtures (new), 1-1-11.....	1210 89
Cash on hand and in bank, 1-1-10..	282 39
Stock on hand, 1-1-10.....	1780 66
Fixtures on hand, 1-1-10.....	1193 18

In addition to the foregoing statement I may say that there were no bills payable or receivable on January 1, 1910, at the beginning of the year. Of the amount I drew from the business, \$500 was taken for an outside investment. The expenses included everything, even to freight and drayage, but not my salary as proprietor. The fixture item represents show-cases, counters, shelf bottles, utensils, etc., but not shelving, which belongs to the owner of the building. I dispensed 4518 prescriptions and received \$2110.70 for them.

MINNESOTA.

This statement is peculiar as indicating an enormous gross and net profit. Let us find

out what these respective figures are by analyzing the different items.

Stock inventory January 1, 11.....	\$2861 04
Stock inventory January 1, 10.....	1780 66
Increase in stock inventory.....	\$1080 38
Purchases	\$4190 19
Goods unsold.....	1080 38
Cost of goods sold during year.....	\$3109 81
Total cash and credit sales.....	\$8112 66
Cost of goods.....	3109 81
Gross profit.....	\$5002 85

A gross profit of \$5000 on a business of \$8000 is certainly remarkable. This means a percentage of gross profit amounting to 61½! The average, mind you, is 40 per cent, and a pretty good average it is, too. Any man who can make 61 per cent on his sales is beyond us. He certainly must get beautiful prices!

The expenses are given as \$1136.97, but inasmuch as these do not include the proprietor's salary, we have assumed this to be \$1000, and have therefore arrived at a total expense of \$2136.97. Dividing this amount by the sales, we have a percentage expense of about 28. Subtracting the percentage of expense from the percentage of gross profit, we have left a percentage of net profit amounting to 35. This, we repeat, is astonishing. It is more like the average gross profit than a net profit, and we can only assume that "Minnesota" must be a twentieth century wizard of some kind.

We looked first for a mistake in the figures somewhere, and we do find that "Minnesota" shows a smaller profit in actual assets than the foregoing analysis would indicate. Here is what his statement shows him to have made from the business:

Amount drawn during the year.....	\$2246 95
Increase in stock inventory.....	1080.38
Increase in fixture inventory.....	12 71
Increase in cash.....	281 56
Total	\$3621 60
Bills payable	355 47
Actual income from the business.....	\$2266 13

This is what he seems actually to have made from the business, but in analyzing the profits as we have done earlier in these comments, we seem to have the following income:

Net profits.....	\$2865 88
Salary	1000 00
Total income.....	\$3865 88

Here is a difference of about \$600, and apparently "Minnesota" has made this much less than he thinks he has.

We took off nothing for depreciation on either fixtures, book accounts, or stock. If this had been done, it would cut down the total income somewhat, though not materially. The degree of profit gotten by "Minnesota" from his business seems astonishing from any point of view.

A PROFITABLE LITTLE BUSINESS.

A South Dakota druggist, desiring to have us comment on his business, submits the following statement:

Inventory Jan. 1, 1910.....	\$2,649 00
Inventory Jan. 1, 1911.....	2,712 00
Business done	6,441 95
Expenses, not counting salary.....	566 12
Salary	950 00
Investments made with store's receipts..	898 41
Clerk hire for soda fountain in April...	75 00
Discounts	68 00

This druggist is located in a town of 400 people. He owns the building and lives back of the store. He says he counts as rent the interest on his money invested in buildings, plus the taxes, insurance, repairs, etc. His credit accounts are small as he tries to collect everything by January 1.

The stock increased \$63 during 1910, as may be seen from the difference in the inventory showings at the beginning and end of the year. Adding to this increase an investment of \$898.41, we get an apparent net profit of \$961.41.

Adding the expenses, \$556.12, to the salary, \$950, plus \$75 for clerk hire, we obtain total expenses of \$1581.12.

The year's purchases are not given, and to arrive at the gross profits we must therefore add the expenses, \$1581.12, to the net profits, \$961.41, which equals \$2542.53. Subtracting this sum from the total sales, \$6441.95, we find the purchases to have been \$3899.42.

Dividing the net profits by the sales we find the percentage to be 14.95, a good showing. The gross profit, obtained likewise by dividing by the sales, is 39.4 per cent. The percentage of expense is 24.54, obtained by dividing \$1581.12 by the sales of \$6441.95.

THE HALL OF FAME

PROFESSOR LLOYD OFFERED THE MAYORALTY.

Prof. John Uri Lloyd was recently offered the mayoralty of Cincinnati under conditions which will prove very interesting to his numerous friends in American pharmacy. Last winter the Professor was a member of the

JOHN URI LLOYD

Grand Jury of Cincinnati which exposed political corruption so effectively, and which returned a number of indictments against public officials of one character and another. The people of the city were anxious to have this reform movement kept up, and it was only a sequel of the situation that a committee called upon Professor Lloyd at the Lloyd Library a month or two ago and practically offered him the mayoralty of Cincinnati on a silver platter.

The committee was made up of members of all parties. They offered Professor Lloyd the nomination in the name of the Democratic party, but that was because his allegiance had usually been to the Democracy. He was assured that if he would accept the nomination, practically all other candidates would withdraw in his favor. The committee felt unanimously that Professor Lloyd, not only because of his fearless work on the Grand Jury, but also because of his quarter-century of activity in the interests of civic betterment,

was admirably qualified for the position of political leader in the community.

Professor Lloyd's friends in pharmacy will be interested to know that his reason for declining the nomination was the fear that, if he should enter politics at this time, he would find the rest of his life practically devoted to public work, with the result that his life efforts in behalf of pharmacy would have to come practically to an end. He felt that while others could be secured to serve the public of Cincinnati, no one could as easily be found to do the peculiar work he is rendering in behalf of American pharmacy. Therefore he put personal opportunity behind him and refused the crown.

ONE OF THE A. PH. A. PRESIDENTIAL NOMINEES.

At the Boston meeting of the A. Ph. A. three men were nominated in the customary manner for election to the presidency of the organization. These men were Charles Holzhauser of Newark, N. J., Prof. Wm. B. Day of Chicago, and William Mittelbach of Boonville, Mo. We were able to print portraits of the last two nominees in connection with our

CHARLES HOLZHAUSER.

editorial summary of the Boston meeting in the September BULLETIN. The picture of Mr. Holzhauser, however, did not reach us in time for this purpose, and we are therefore publishing it this month. Mr. Holzhauser is the proprietor of a very successful and long established pharmacy at 787 Broad

St., Newark, and he has been a regular attendant upon the meetings of the A. Ph. A. for many years. These three nominees will be voted upon in the customary manner by mail some time during the next two or three months.

THE NEW DEAN IN CLEVELAND.

In the BULLETIN of last month we made some editorial reference to the appointment of Dr. Norman A. Dubois as Dean of the Cleveland School of Pharmacy, to succeed Professor Army, who had been taken to New York to fill the place left vacant by the resignation of Professor Coblenz. We were unable last month, however, to print Dr. Dubois' portrait, and we are grasping the occasion to correct the omission in this issue of the BUL-

DR. NORMAN A. DUBOIS.

LETIN. Dr. Dubois was present at the Boston meeting of the A. Ph. A. in August and gave the members a chance to see what the new Dean looks like.

A VICTORIOUS GIRL.

A surprising achievement was registered by a young woman at the last commencement of the Albany College of Pharmacy. Four prizes were awarded on that occasion to members of the senior class, and Helen F. Sheehy of Little Falls, New York, figured in all four instances. She won two of the prizes, and she received first honorable mention in the other two cases. Prizes were awarded her for

passing the best senior examinations in all branches, and also for doing the best senior work in chemistry. The honorable mentions were secured with reference to the prizes

HELEN F. SHEEHY.

awarded for the best senior work in pharmacy and for the best senior work in materia medica. There is no telling what Miss Sheehy would have done if the list of prizes had been larger. Apparently she was determined either to get the first or second prize in every event, no matter how many there were! And it would seem that she made the young men in the class sit up and take notice! Miss Sheehy has been connected with the firm of O'Rourke & Hurley in Little Falls for the past five years, and since her graduation from the Albany College she has been employed by the same firm as licensed pharmacist.

SOMETHING DOING IN CALIFORNIA.

Mr. Carson Angel, one of the hustling representatives of Parke, Davis & Company on the Pacific Coast, has just been appointed by President Lichthardt of the California Pharmaceutical Association as chairman of the Traveling Men's Auxiliary. It will presumably be Mr. Angel's duty to make arrangements for next year's convention at Del Monte, and no one who knows Mr. Angel doubts that the work will be well done. Some novel features are under contemplation, and Mr. Angel and the other members of his committee will undoubtedly see to it that something new is pulled off next year.

This pharmacy, shown on page 318 of the August BULLETIN, was asserted to be that of Martin E. Luther, of Kalamazoo, Mich. As a matter of fact, however, it belongs to F. L. Vilas, of Pierre, S. D.

Another error was made in the August issue in mentioning the Earl Drug Company, of Ridgway, Pa., as the proprietors of this establishment. On the contrary, this is the store owned by Martin E. Luther, of Kalamazoo, Mich.

This is another view of Mr. Luther's pharmacy in Kalamazoo. The fixtures were furnished by the Wilmarth Show Case Co., and the fountain by the D. Karle Company.

Here we have the drug store of the Thompson & Ford Lumber Co., of Grayburg, Texas. It is located in a thriving region and does a hustling business.

E. M. Kay, 71st and Euclid Ave., Chicago, is the proprietor of this establishment. The location is in the extreme southern part of the city called Bryn Mawr.

This is another view of Mr. Kay's pharmacy in Bryn Mawr, Chicago. Mr. Kay evidently makes specialties of stationery, souvenir post-cards, and a circulating library.

Drug Stores Here and There.

K. E. Anderson, Ph.G., is the proprietor of this store in Glasgow, Mont. Mr. Anderson himself is shown at the left of the picture, while the man at the right is his clerk, W. C. Arendsen.

Here we have another view of Mr. Anderson's store in Glasgow, Mont. Judging both from this picture and the preceding one, Mr. Anderson does a lively soda business and is equipped to handle it.

This is the store of G. R. Thomason, which is located in Stockton, Kansas. Mr. Thomason is presumably the man standing behind the cash register—a very suggestive position for a druggist to be in!

This somewhat unique establishment is that of A. Ditrapani, president this year of the Louisiana State Pharmaceutical Association. The location is in the residential section of New Orleans, La.

A. L. Richey is the proprietor of the Richey Drug Company, located at the corner of Winter and Emerson Streets in Haverhill, Mass. Mr. Richey and his staff are here shown.

C. W. Terry, M.Ph., is dispensing a prescription for the Adams Drug Co., of Forney, Texas. Mr. Terry is a graduate of the Tulane School of Pharmacy, class of 1901.

Thomas S. Armstrong of New Jersey,

A sincere, courageous, warm-hearted leader of the N. A. R. D. who always talks to the point and who has taken the floor in many a hot argument.

The N. A. R. D. at Niagara Falls.

THE N. A. R. D. CONVENTION AT NIAGARA FALLS.

**The Organization in a Flourishing Condition—\$20,000 in the Treasury and the Sum Increasing—Looking to New Fields of Activity—A Greater Legal Department Contemplated to Give Free Counsel to State Bodies and Individual Members—Appointment of Salaried Telephone Representative Who Will Travel in the Interests of Retailers—Important Legislation Discussed, Including the Sherley Bill, the Parcels Post, and the Proposed Department of Public Health—The Wiley Entanglement Avoided—Measures Taken to Insure Price Protection—
H. C. Shuptrine Elected President and Chas. H. Huhn
Chairman of the Executive Committee.**

The roar of the cataract flowing over Niagara Falls could hardly be used to indicate the character of the N. A. R. D. convention held there last month. Those who looked for excitement were doomed to disappointment. Save for an occasional outburst on

and the despatch with which he ran the proceedings did much to sustain the interest of the members that might otherwise have flagged. For there was nothing of a stirring nature to engross their attention.

THE ILLNESS OF ERRANT AND MUIR.

The convention opened inauspiciously. Judge Errant had just suffered an attack of apoplexy and lay unconscious in Chicago during the meeting—a fact which threw a sort of pall over the assembly. The legislative conference was in a way the main event of the convention. Since this centered about Judge Errant, it looked as though his loss were all but irreparable. As Mr. Mann said before the assembly, just when the association was about to organize a greater legal department, Judge Errant, upon whom so much depended, had been stricken down. A new man in the work must begin all over again. Let us hope that time will restore the

Joseph W. Errant, General Counsel, stricken with apoplexy shortly before the convention started.

the part of a single individual, the meeting was a comparatively placid affair. But while there were no startling developments, nothing new or sensational, one could discern beneath the calm surface of the proceedings a heavy undercurrent of work being done. In their quiet way the members of the Committee on Resolutions were exerting themselves to the utmost. They thought nothing of staying up till two in the morning molding into acceptable shape the various recommendations made in the sessions. The Resolutions Committee appeared to be the great hopper into which all projects of importance were dumped to be threshed out and offered later in the form of formal resolutions. And this year the members did yeoman service.

President Guilford presided beautifully. While he had never offered any pretensions as a parliamentarian, his natural executive ability made itself felt in the chair. At every turn he expedited the work of the convention,

Dr. William Muir, of Brooklyn, stricken with a serious illness as he was about to leave for the convention.

Judge to his former activities. Frank H. Freericks took the chair in the absence of Judge Errant and guided the conference very creditably. Another prominent member, Dr. William Muir of Brooklyn, had been stricken with what was said to be a fatal illness just

as he was leaving for Niagara. Thus fate was unkind to the convention at the start.

But whatever be the personal losses sustained by the association during the past year, in a material way it was never so prosperous. There is \$20,000 in the treasury. A nice sum! It certainly ought to keep the association out of want. If the fund continues to swell as we expect, the N. A. R. D. will soon be a wealthy organization.

THE PRESIDENTIAL CONTEST.

President-elect Shuptrine enters his* term of office under pleasant circumstances. At first it looked

President-elect H. C. Shuptrine, of Savannah, Georgia.

as though there would be a contest over the presidency with more or less feeling prevalent in the two opposing factions. Henry W. Merritt represented the A. D. S. party, while Herman C. Shuptrine was spoken of as an independent candidate. But soon it developed that both men were A. D. S. members, the only difference being that Merritt was considered radical while Shuptrine maintained an independent attitude. Shuptrine was ultimately elected by acclamation. When he was about to take the platform to accept the office, President Guilford had the diplomacy to ask Merritt, the defeated candidate, to lead Shuptrine to the chair. This he did with rare grace. In a warm and eulogistic speech he congratulated Mr. Shuptrine on his election, showing that he nursed no grudge over his defeat and throwing all his personal influence to the support of his successful opponent. It was a very generous and magnanimous thing to do and contributed decidedly to the harmony of the meeting.

PROPOSED FEDERATION OF THE A. PH. A. AND THE N. A. R. D.

Prof. James H. Beal extended greetings from the A. Ph. A. in much the same way that Mr. Guilford had conveyed to that body assembled in Boston the good wishes of the N. A. R. D. Professor Beal spoke of the fraternal spirit existing between the two organizations. Both have the same end in view, he said, although they functionate in different ways. Without the

attention that the scientific side of pharmacy receives from the A. Ph. A. there would be no State board examination, and without the support of the N. A. R. D., efforts to improve trade conditions in the drug business would meet with little success. Professor Beal went on to dwell on the organic relationship between the two bodies. "What helps one," he said, "benefits the other. What hinders one hurts the other."

Because of this close relationship between the two, it has frequently been suggested that they be federated. This was discussed at the A. Ph. A. meeting in Boston. If it means that either of the two is to lose its identity, then both would suffer by the merger, contended Professor Beal. Both the scientific and commercial sides of pharmacy require the efforts of organized bodies. An association must specialize either in the scientific functions of pharmacy on the one hand or trade questions on the other. Both interests could hardly be served by one body. Professor Beal believes in promoting a better understanding and coöperation between the two associations, while each retains its individuality. If a proposition runs the gauntlet of the A. Ph. A. it is pharmaceutically correct. If it later receives the approval of the N. A. R. D. then it must be entirely satisfactory.

INTERSTATE ANTI-NARCOTIC LEGISLATION.

Among the legislative efforts of a constructive nature is a movement to secure a Federal law for the suppression of illicit traffic in habit-forming drugs. There are now on the statute books in many States laws forbidding the sale of opium, cocaine and morphine, but there

Henry W. Merritt, a cheerful loser. He graciously introduced his successful rival to the convention.

is no National law which prevents or prohibits interstate traffic in these drugs. There is nothing on the books, for instance, which prevents the shipment of these drugs from a point in New Jersey to a place in any other State, and this is what the association is aiming at. In this connection the convention had hoped to receive a talk from Dr. Hamilton Wright, of Washing-

ton, D. C., Commissioner of Opium Traffic, United States Department of State at Washington, but he was unable to be present.

The transportation of narcotic drugs in interstate commerce without let or hindrance has handicapped many States which have most admirable intrastate laws for controlling the traffic in these drugs. As John C. Wallace of Pennsylvania said: "Interstate laws without intrastate laws are valueless, and vice versa." President Taft in his special message to Congress had requested that a suitable law be passed to regulate the sale of narcotics. The N. A. R. D. went on record again as opposed to the indiscriminate sale and transportation of these abominable narcotic and habit-forming drugs. Several foreign countries are also opposed to it. Even China, which derived great revenue from these drugs, is restricting all production of opium. The movement appears to be world-wide.

It was felt, therefore, that the passage of an anti-narcotic law with proper restrictions would not only rid this country of illicit dealers in the nefarious traffic, but would also place the medical and pharmaceutical professions on a higher plane. The association favors interstate anti-narcotic legislation that will prohibit all illegitimate traffic in narcotics and habit-forming drugs, confine their sales to proper channels, and their uses to strictly medicinal purposes.

THE TELEPHONE SITUATION.

The association is making a fight to obtain for druggists their fair share of telephone earnings. The druggists of Chicago alone have made several million dollars by proper attention to the telephone business. And

mann, chairman of the Telephone Committee, cited a few instances to the point. Baltimore with 350 druggists suffered all kinds of trying conditions in the telephone service. Some were paying a large rental while deriving little income from the telephone. Others were getting a small percentage of the earnings. Through the good work of the N. A. R. D. Mr. Bodemann got the local committee together and after several meetings with the telephone company, slot machines were in-

Charles F. Mann, who retired from the chairmanship of the Executive Committee after several years of service, and who is to be presented with a gift on behalf of the members.

Wilhelm Bodemann, Chairman of the Telephone Committee, at whose suggestion a telephone expert is to be employed.

stalled in every drug store. After a few more meetings the committee succeeded in obtaining 20 per cent on all the money taken in.

Again in Kansas City a few years ago, the Bell Telephone Co., which enjoyed a monopoly on the telephone privileges, demanded unreasonable rates from the druggist. It happened at the time that an independent company was looking for a foothold and the druggists took it upon themselves to support the latter concern and throw out the Bell 'phones. After one year, the subscribers of the independent company succeeded those of the Bell, and it is generally conceded that it was the druggist who made this possible.

Mr. Bodemann showed a feeling of vigorous resentment against druggists who are holding out against mutual telephone agreements. He recommended the hiring of a capable solicitor to look after the telephone situation. And it was at the instigation of Mr. Bodemann that the Executive Committee was instructed to utilize the services of at least one organizer for special work to improve conditions in the retail drug business in the matter of telephone service and commissions. What is wanted is an upward, not a downward, revision of the telephone commission tariff. The usual commission allowed retail druggists on their telephone is 40 per cent on city messages and 20 per cent on outside tolls. This is only a fair compensation to the retail druggist considering the fact that he furnishes rent, light, heat, and clerk hire for the maintenance of the 'phones. The American Telephone Co., however, is

when we consider that the company made two dollars for every one received by the retailer it is hard to conceive how druggists and telephone companies in other cities can shut their eyes to both the improvement of the service and increase of income possible if the telephone situation is handled properly. Wilhelm Bode-

using the utmost endeavors to reduce this commission, making a flat rate of 10 per cent on all messages. Ex-President Guilford considered this reduction unfair and unjust and recommended that the association demand a commission of not less than 40 per cent, and urged the Telephone Committee to use every honorable means to accomplish this end. Incidentally Mr. Guilford congratulated the Telephone Committee on its splendid success in adjusting the telephone difficulties between the retail drug trade and the telephone companies throughout the United States.

It was finally resolved that the organizer selected to

W. S. Elkin, Jr., of Atlanta, Ga., a prominent member of the association who officially notified Mr. Mann of the presentation to be made to him later on.

work under the supervision of the Telephone Committee should visit such cities as give promise of installing the slot 'phone. He is also to visit any places that have telephone troubles in order that he may adjust them in the interest of N. A. R. D. members. From time to time representatives of the N. A. R. D. will confer with the officials of the telephone company with a view to preventing encroachments upon the present business compensation.

D. J. Reese, in a supplementary report to the Telephone Committee, showed that the telephone earnings in Philadelphia were greatly increased by the installation of booths and other equipment. The average monthly receipts advanced from \$15 to \$30. In fact many stations doubled their receipts by a change in equipment. In Philadelphia much good has been accomplished by properly coöperating with the Bell Telephone Co. During the past eighteen months the Pell Company has spent \$40,000 on druggists' telephone equipment.

A TAX ON MEDICINAL PROPRIETARIES

When the Sherley bill came up for consideration the cry arose at once, "kill it." This bill, it will be remembered, proposes to revive that part of the old Spanish war tax which imposed a tax on all proprietaries han-

dled by the retail druggist. The results of that tax are still fresh in the minds of all those who shared in the taxation. Through his loyalty to his country and the knowledge of the need of taxation of all kinds of business in war time, the druggist accepted the burden then without complaining. Now to reimpose this burden upon the already overtaxed druggist, seems an unjust, unwarranted and unnecessary taxation.

As soon as the Legislative Committee learned of this bill they immediately proceeded to show their strong protest against it and to use every possible means to prevent the burden being reimposed upon the retail druggist. When we realize that there are over 400 members of Congress who have a right to vote upon this measure, and that some of them were strongly urging the passage of the Sherley bill, we see the task that was before the Legislative Committee in attempting to defeat the measure.

Of course the local and State associations were of assistance in that they notified the members of Congress from their districts that they were very much opposed to such legislation. The Legislative Committee filed with the congressmen several strong petitions received from druggists in different States. At present it looks as though the Sherley bill will probably never be reported out of committee, but it will be necessary for the druggists generally to keep a close watch over the coming session of Congress.

BILL TO CREATE A DEPARTMENT OF PUBLIC HEALTH.

Frank H. Freericks, who took the chair in the absence of Judge Farrant during the legislative conference, said

Harvey I. Leith, of Providence, R. I., re-elected treasurer.

that the bill to create a department or bureau of public health at Washington is the most important that has come up in the last ten years. It must have consideration now, for in a year the bill will be a law. At present it ignores pharmacy. Nor is there any recognition of chemistry. Dr. Anderson indorsed a resolution requesting a recognition of pharmacy in the Department of Public Health. F. W. Meissner of Indiana said that

the A. Ph. A. had favored a department of health provided it have a bureau of pharmacy and chemistry. Charles H. Huhn also insisted that pharmacy be recognized in this department. James F. Guerin of Worcester, Mass., demanded that a pharmacist be appointed to the department of public health.

The convention had no objection to appointing the director of public health to a position in the president's cabinet, but it was felt that his qualifications should be specified. By way of showing the importance of this department Frank H. Freericks pointed out that the department of public health will have in charge all the various functions pertaining to the public health. Thereupon Thomas Stoddart of Buffalo reminded the convention that each State, county and city already has its own board of health. The maintenance of a national department of public health would therefore mean further taxation for what is already taken care of. We have sufficient bureaus of health now. Charles M. Carr, editor of *N. A. R. D. Notes*, expressed himself as opposed to a department of public health, but added that if one must be, then let pharmacy be recognized. This practically is the attitude of both the A. Ph. A. and the N. A. R. D. generally.

Thus far the bill to create a department of public health has failed to pass Congress notwithstanding the influence that was used to put it through. It was finally resolved that the N. A. R. D. favors a national department of health for the control, discharge and supervision of all national government activities which concern the public health, provided first that its establishment include a supervising board with proper representation from pharmacy to whom all questions contemplating changes from existing conditions, and manner of regu-

consider the provisions under which a national department of health is to be established.

SYSTEM OF ELECTING DELEGATES.

There was a disposition among some of the members of the convention to criticize the present system of electing delegates. The N. A. R. D. wants the support of the State association, but John C. Wallace, of Pennsylvania, contended the association does not need monetary aid. Mr. Wallace maintained that all States should have equal representation in the national body. He does not believe in a monetary basis of representa-

Thomas S. Armstrong, who advised the convention not to become involved in Dr. Wiley's recent embroilment.

D. N. Robin, of Pittsburg, who, as President of the National Association of Pharmacologists, was a delegate at the meeting.

lation for control, must be submitted, and whose decision must be final in governing the administration of said department. Secondly, that its various sub-departments include one especially devoted to pharmacy and another to chemistry, each to be in charge of a specially qualified person. It was resolved, too, that the Executive Committee be instructed to request representation for pharmacy at conferences that are held to

tion. All State associations should be considered as delegates at large. State associations are composed of manufacturers, wholesalers, and teachers, as well as retailers, and the first three are not eligible to representation. Each State, he maintained, should pay \$25.00 and have equal representation.

Simon Jones, on the other hand, said the N. A. R. D. can use every dollar obtainable. Mr. Meissner of Indianapolis said that at present \$25.00 is the charge for two representatives. The State contributions, according to Secretary Potts, amount to about \$2300 a year. Delegate Meissner, while unwilling to lessen the receipts of the N. A. R. D., felt that equal representation for all States is desirable. In many instances, he argued, local organizations have drawn upon the State for delegates instead of paying for them out of the funds of the local associations. Mr. Meissner added that the only equitable system was one where all States have equal representation.

Robert K. Smither, of Buffalo, held that the N. A. R. D. wants the moral support of the States, but added that representation without taxation cheapens the privilege of representation in a national body. No one appreciates anything that he doesn't have to pay for. A State having few representatives in a national organization does not deserve as much representation as the

State with a large paid membership in the national body. Mr. Smither recommended that the States continue to pay a per-capita tax. There are now 32 affiliated State associations.

Mr. Elkin, on the other hand, favored equal representation for all States. He cited the Senate as a very good model for the N. A. R. D. In the Senate each State is allowed two members. Mr. Elkin didn't care whether each State had two representatives or three. It mattered not whether they pay \$25.00, or \$50.00, or \$100.00, but Mr. Elkin pleaded for equality in representation of the States. Mr. Cannon, of Illinois, took the same view of the matter as Mr. Elkin.

Finally the advisability of having two delegates from each State was offered as an amendment to the constitution, and will therefore be held over till next year.

AVOIDING THE WILEY ENTANGLEMENT.

A resolution taking Dr. Wiley's side of the recent Washington embroilment was held up, not out of any antipathy to the pure food and drug expert, but rather out of a desire to keep the association free from embarrassing entanglements. This was surprising, considering the way the various State associations went on record as supporting Dr. Wiley in his recent conflict with Secretary Wilson of the Department of Agriculture. The association neither indorsed nor censured Dr. Wiley, the idea being to let the Washington authorities decide themselves whether Dr. Wiley was in the right.

Mr. Emanuel, of Pittsburg, said that the convention could not fail to indorse Dr. Wiley without reflecting on the national association. Thereupon Mr. Armstrong showed how the N. A. R. D., in keeping with its past policy, could continue to approve of pure food and drug legislation without mentioning Wiley's name. Mr. Pritchard maintained that it would be a shame to adjourn the convention without favoring Dr. Wiley, a sentiment which was indorsed by Mr. Meissner. The Chicago delegates, it seems, were ill-disposed to Dr. Wiley over the ice-cream prosecutions that had been made in that city.

Finally, a resolution was adopted that really side-stepped the Wiley-Rusby incident. The thanks of the association were extended to Dr. Wiley and his associates for every act of theirs which have given effect to the principles of pure food and drugs as declared and reiterated by the N. A. R. D.

PRICE PROTECTION.

Throughout the history of the N. A. R. D. price protection has stood out as the great issue. While various plans have been tried and found failures, the association feels that it is just beginning to find a way to obtain a living profit on the sale of proprietary medicine. In this connection due appreciation was shown the Miles Medical Co. for the vigorous and whole-hearted manner in which it had championed price protection on the trade agency contract and serial numbering plan. Thanks were also extended to the Freeman Perfume Co. and all other manufacturers who have supported the cause of price protection.

The hope was expressed that the action of the Miles Co. should serve as an object-lesson to every other manufacturer marketing his products through the retail

drug trade. Pres. Guilford urged upon all the members assembled the necessity of doing everything in their power to assist those houses who father the price-protection plan. He urged that when a contract is submitted for signature the retail druggist sign it at once and thus do his share in making more general the system of price protection.

The association firmly believes in the effectiveness of a contract plan as a means of securing legal and beneficial price protection. Considerable interest was shown in the general price-protection system submitted by the Chicago Retail Druggists' Association, to wit:

One dollar "Patents" to sell at wholesale at \$12.00 per dozen free to anybody through whatever channel.

Each bottle to have a coupon of $\frac{1}{2}$ of \$1.00 attached.

Such coupon should be sent, through secretaries of the city and county associations, to the N. A. R. D. headquarters, which in turn should collect from manufacturers, or their agents, the amount due and forward it to the different State, county, or city associations.

Coupons to be redeemable only provided "patents" are sold at full selling price printed on the label.

Preparations of smaller denomination than \$1.00 to be handled similarly.

Preparations selling at below \$2, \$4, and \$8 to bear coupons of proportionately larger denominations.

John J. Boehm, of Chicago, author of this coupon

Frank H. Freericks, who presided ably over the legislative conference.

plan of price protection, addressed the convention and was given a very close hearing.

It was finally resolved that the new plans for price protection proposed by the Lawrence County Retail Druggists' Association of Pennsylvania and the Chicago Retail Druggists' Association be referred to the executive committee with power.

THE PARCELS POST OPPOSED.

In view of the different positions that the various State pharmaceutical associations have taken on the parcels post question, it is well that this question came up for consideration. It seems that during the last session of Congress there were several bills pending, some of which were for a general parcels post, others

for a limited parcels post, and still others for experimental parcels post.

When the committee of national legislation learned that the Post Office Committee was going to take up the subject of Parcels Post, they appeared before Congress and explained why druggists are opposed to it. They pleaded very hard against any form of the system in the belief that it would give large commercial concerns the means of crushing out the small dealers all over the country. That feature of the scheme was placed very forcefully before the Post Office Committee, and the N. A. R. D. itself, at the Niagara convention, went on record again as opposed to a parcels post of any sort or nature.

CHANGING THE NAME OF WOOD ALCOHOL TO WOOD NAPHTHA.

There was a vigorous debate over the advisability of changing the name of wood alcohol to wood naphtha. Soon after the adjournment of the Pittsburg convention last year Judge Errant took up the resolution of that convention with a view to adopting the name of "wood naphtha" in place of wood alcohol or methyl alcohol. After some investigation he concluded that

H. B. Guilford, retiring president and member of the Executive Committee.

this is a matter to be considered separately by each individual State.

Secretary Potts said that in Minnesota the name of wood alcohol has already been changed to wood naphtha, and he quoted Judge Errant to the effect that it would be hard to make this law national. Mr. Potts suggested therefore that each State follow the action of Minnesota in this matter. No revenue is derived from wood alcohol. For that reason the Federal government cannot interfere. The whole matter is without the jurisdiction of interstate commerce. Mr. Potts argued that there is no need of using the name "wood alcohol." The uneducated are apt to consider this fluid merely a cheap grade of ethyl alcohol, a mistaken belief that has led to many cases of poisoning.

Mr. Wallace said that in McKean county in Pennsylvania, where people live in contact with wood alcohol, there are no cases of poisoning from the substance. He maintained there should be good reason before the association attempts to change the name from wood alcohol to wood naphtha. Mr. Armstrong, on the other hand, cited a case of a hobo who was stricken blind by drinking wood alcohol. Mr. Anderson also took up the cudgel against the use of the term wood alcohol and showed how even physicians confounded ethyl and methyl alcohol. And turning slyly to Mr. Wallace, Mr. Anderson remarked that possibly the Pennsylvania people, after their usual tolerance for ethyl alcohol, have an unusual capacity for wood alcohol.

Mr. Meissner, of Indiana, contended that wood alcohol should be tabooed for all medicinal uses, external as well as internal. Delegate Stuckey said that five men had perished in his town for mistaking wood alcohol for ethyl. He cited another case of total blindness following the ingestion of wood alcohol. Mr. Selzer, of Cleveland, also cited a case. Mr. Wallace, still unconvinced, questioned the poisonous nature of wood alcohol, whereupon some one shouted: "Drink some of it."

It seems that there is a temptation among druggists having no liquor license to sell wood alcohol. Mr. Bodemann told of a college professor who suffered blindness from trying for himself the physiological effect of wood alcohol. Mr. Emanuel moved then that the Pharmacopœial Committee be requested to introduce wood alcohol under the name of wood naphtha. Mr. Pritchard said that the A. Ph. A. had resolved to induce State organizations to use the term wood naphtha.

THE GREATER LEGAL DEPARTMENT.

The N. A. R. D. has been considering the feasibility of giving greater legal service to the members. It will be remembered that the action of the Executive Committee following the resolutions adopted by the Pittsburg convention last year formulated some ambitious plans for the Legal Department. In brief, they intended to put at the disposal of all affiliated associations and all the dues-paid members the services of the Legal Department of the N. A. R. D.

The plans outlined for the greater Legal Department are to furnish as much advice as possible to individual dues-paid members, to aid State associations and State legislation, to originate both State and national laws when deemed advisable, to codify the laws of the various States with the aim of bringing about uniform legislation, and to extend the Legal Department of the N. A. R. D. whenever possible. That the new movement has been much appreciated is evidenced by the extensive use which has been made of the department. When it was announced that the N. A. R. D. had created a Greater Legal Department, associations and druggists everywhere communicated with that department in increasing numbers. It is believed that the N. A. R. D., in undertaking this work of coöperation with the affiliated associations, State and local, is entering upon a most promising field. The only danger seems to be the liability of entailing too great an expense for the parent organization.

U. S. P. AND N. F. PROPAGANDA.

The U. S. P. and N. F. propaganda received considerable attention. Statistics from the organizers' work indicated that the plan of carrying on this work and the material sent to doctors are generally accepted as entirely satisfactory. In the majority of cases where the propaganda has failed, Frank C. Ullrich, General Organizer, attributed the failure to the fact that the retailers did not carry out their part of the plan. The report of the previous U. S. P. and N. F. Propaganda Committee made at Pittsburg last year contained several valuable recommendations which were carried out during the past twelve months. In Boston the local druggists have hired a detail man to canvass the doctors three times a year in the interests of U. S. P. and N. F. products. The results of this work have been very satisfactory. It was generally felt that the number of U. S. P. and N. F. preparations called for in prescriptions has increased during the past two years.

Mrs. William E. Lee, who becomes secretary of the W. O. N. A. R. D. after several years' occupation of the presidency.

very appreciably through the efforts of the Committee on U. S. P. and N. F. Propaganda. This has been accomplished largely through a liberal distribution of samples and the extensive use of literature.

MR. MANN'S RETIREMENT.

Considerable regret was expressed over the resignation of Charles F. Mann as chairman of the Executive Committee. It was resolved that whereas Mr. Mann has retired after serving so many years with such ability, an irreparable loss had been sustained. Feeling that some formal observation should be made of Mr. Mann's retirement from the Executive Committee, Mr. Elkin, on behalf of his many friends, mounted the platform and addressed Mr. Mann: "Mr. Mann, I have been authorized by some of your numerous friends at this convention to say a few words to you. At this meeting the only sadness which I have heard expressed is that Charles F. Mann is going to retire. Your friends realize your sacrifices and they

have felt that something extraordinary was due you." Mr. Elkin then went on to inform Mr. Mann that several of his friends had contributed for the purpose of presenting both Mr. and Mrs. Mann a token of their esteem. Only Mr. Elkin's extreme tact and wit saved his presentation speech from spreading a feeling of sadness over the convention. Certainly Mr. Mann goes down in the history of the N. A. R. D. as one of the strong men of the organization, one who has always served that body with unstinted generosity and devotion. He has given liberally of time that many houses would have been glad to pay for.

Mr. Mann in replying expressed the wish that he might give up his job without this publicity. He assured the convention that he has been amply rewarded for his services in the many friendships that he has made in the association. "I don't know any greater heritage that a man can have," he said, "than to retire with the warm regards of the members of this association."

THE NEW OFFICERS.

The following officers were elected:

President, H. C. Shuptrine of Savannah, Ga.

First Vice-President, T. B. Cartmell, Wilmington, Del.

Second Vice-President, E. A. Bernius, St. Louis, Mo.

Third Vice-President, S. A. Eckstein, Milwaukee, Wis.

Secretary, Thomas H. Potts, Chicago, Ill.

Treasurer, Harvey I. Leith, Providence, R. I.

Executive Committee: Charles H. Huhn of Minneapolis, Minn., chairman; H. B. Guilford of Rochester, N. Y.; Henry W. Merritt of Plains, Pa.; J. Arthur Bean of Boston, Mass.; A. E. Zuber of Chicago, Ill.; E. H. Thiesing of Cincinnati, Ohio.

THE W. O. N. A. R. D.

The Women's Organization convened in the parlors of the International Hotel. Mrs. William Estell Lee of Philadelphia presided over the deliberations of this organization. The officers elected are as follows:

President, Mrs. C. A. Storer of Chicago, Ill.

First Vice-President, Mrs. J. G. Godding of Boston, Mass.

Second Vice-President, Mrs. Louis Emanuel, Pittsburg, Pa.

Third Vice-President, Mrs. F. H. Fricke, St. Louis, Mo.

Fourth Vice-President, Mrs. J. O. Bosley, Wilmington, Del.

Fifth Vice-President, Mrs. R. G. Rutherford, Brooklyn, N. Y.

Secretary, Mrs. William E. Lee, Philadelphia, Pa.

Treasurer, Mrs. Otto C. Groenland, Cincinnati, Ohio.

Executive Committee: Mrs. W. S. Richardson, Washington, D. C.; Mrs. R. E. Dorland of Decatur, Ill.; Mrs. J. J. Seiberz of Louisville, Ky.; Mrs. John T. Roe of Mobile, Ala.; Mrs. F. E. McBride of Youngstown, Ohio; Mrs. H. C. Shuptrine, Savannah, Ga.

The place of meeting for next year has not yet been decided.

A HALLOWE'EN WINDOW OF COUGH SYRUP.

An Old Mill and an Abundance of Foliage Make a Very Attractive Trim—One Druggist Tried it with Good Results—Details of His Arrangement.

By W. J. DUNLAP,
Canonsburg, Pa.

I submit a picture of a window display I used last Hallowe'en with very gratifying results. The trim attracted so much attention that our daily paper took notice of it and gave us a write-up which proved to be a very good ad. It is inexpensive to make and may be used to exploit any preparation. We were boosting our cough syrup.

I first drove out to the country and gath-

coming together gave off a good imitation of steam. Under the pot I had a pile of large lumps of charcoal, in the center of which I had a red electric light bulb.

BEAUTIFUL AT NIGHT.

At night it certainly showed up beautifully. There were two or three large rough stones in the window, on which the witch was stand-

ered a lot of choice branches and autumn leaves. The ones we secured were dogwood and showed a number of beautiful tints, mostly red and gold. They were covered too with beautiful red berries, which do not show in the picture. I procured a large-sized cheap doll and had it dressed in the witch's costume as shown, making a wig of white rope. I made a tripod of rough limbs and hung on it a pot in which I had one bottle ammonia water and one of muriatic acid; the fumes

ing stirring the pot. A card leaning on the rock bore the announcement: "Brewing Herbs for Our Cough Syrup."

In the opposite end of the window was an old Dutch windmill. Motor power was supplied by a belt run from an electric fan concealed inside to a pulley on one end of the paddles. The mill certainly attracted a lot of attention. I had made it out of a sugar barrel with a keg on top. Both were covered with crêpe paper in blue and gold. Black

bands served as hoops. A small boy doll, dressed as a miller, stood in the doorway: A spout from the mill extended into an old iron pot containing several kinds of herbs. Near by was a card: "Grinding Herbs for Our Cough Syrup." I had three pyramids of cough syrup in window with a card on the one in the back reading, "Stop that cough—Red Spruce and White Pine will do it. A Bottle 50c. and 25c."

Fine wire extended across the back of the window, upon which I hung branches of autumn leaves. Among the foliage I had about a dozen small Jack-o'-lanterns containing small electric lights. These one can buy at almost any racket store for 10 cents each. I

suspended in the center a framed card containing "All Hallowe'en Greetings."

When the lights were turned on at night, the mill running and the pot steaming, the window was certainly a stunner. I am safe in saying that no man, woman or child went up or down our street for two weeks without stopping to take a look.

In conclusion let me say that the sales on our cough cure were very large. We received congratulations by the hundred on this window. The entire cost of the window was not over \$5, and it took one man six hours to complete it.

I am sure any one who copies this idea will be pleased with the results.

MAKING SOUVENIR POST-CARDS PAY.

Buying with an Eye to Profits—The Salability of High-priced Subjects—Several Methods of Display—Special Sales to Stimulate the Business.

By BURTON L. BENNETT,
Bristol, Conn.

Post-cards well displayed are half sold. I have proved this to my complete satisfaction. I am a firm believer in side-lines for the average modern drug store; and post-cards are one of the best side-lines, because they take up

"Giant rack" for displaying post-cards.

very little space, are ready sellers, and pay a good margin of profit.

I was a little late in stocking post-cards, thinking that it was only a temporary fad. Thus I lost the prestige and benefit that belong to a pioneer, as well as the profits that would have accrued to me. An intelligent display of post-cards would have brought a

steady stream of nickels and dimes to my cash register. But I have since made up for my delay by going after the business in a large way, and I feel I have been well repaid for the effort by the satisfactory volume of business I have worked up in this line.

I believe the post-card business has come to stay and is bound to increase in certain directions, particularly in the sale of the higher grades of local views, birthday and holiday cards.

SOME SPECIAL SCHEMES.

Let me outline, briefly, some of the ideas and schemes I have utilized in building up my post-card trade.

I would like to say to those who have never sold post-cards, but may contemplate doing so, that the best argument I know of why they should get a share of this business is that the margin of profit is large, in fact as satisfactory as that derived from the sale of drugs. I average from 100 to 400 per cent profit on all the cards I sell.

The idea is not to see how cheaply cards can be sold but rather to see how cheaply they can be purchased.

Subjects that retail readily at two for five

cents cost anywhere from fifty to seventy-five cents per hundred; occasionally a particularly good card may cost \$1.25 per hundred. This allows a clean profit of 100 to 400 per cent.

Many dealers make the mistake of selling their cards too cheap, because they happen to purchase an assortment at a low price, forgetting that in every lot of cards purchased there are bound to be a number of slow sell-

<p>FOR 25c.</p> <p>IN STAMPS We will mail, post-paid, to any address, one dozen selected Post Cards, consisting of local and state views of interest to all Post Card collectors.</p>	<p><small>FROM</small></p> <p>BENNETT'S DRUG STORE, BRISTOL, CONN</p> <p>Headquarters for Souvenir Post Cards.</p>	<p>PUT STAMP HERE</p>
--	--	--

The face of an envelope in which Mr. Bennett mailed post-cards to customers.

ers and a few that may not sell at all. That is why I get big prices for the bulk of my cards. I can then take the slow sellers, make a special "One-cent Sale" of them, and dispose of the entire lot at a big profit.

The profit is also large on the higher priced cards, of which it pays to keep a large assortment. I keep a goodly number of fancy birthday and greeting cards to sell for 5, 10, 15, 25, 35, and even as high as 75 cents each.

I am often surprised at the number of high-priced cards I sell, as well as at the class of people who buy them. The foreign population especially take to fancy cards of this description; they pay no attention to the cheaper ones. The best is none too good to send to the folks at home in the old country.

A GOOD DISPLAY RACK.

I display my cards principally on what I call my giant rack. This rack is one I built myself, and while I do not claim entire originality for it, still I have never seen anything exactly like it.

The illustration gives one an idea of its size and shape. It stands in the center of my store, occupying a position over a large steam radiator, thus taking up but little more space than the radiator itself.

This giant rack is 8 feet long, 6 feet 4 inches high, and 2 feet 6 inches wide at the base, tapering up to the top in the shape of

an inverted letter V, where I have left an opening of 3 inches to let the heat from the radiator through.

This rack is built of clapboards overlying each other, with the thick edge uppermost, screwed to a framework, filled and varnished. I so arranged the spacing of the boards as to allow for displaying some rows of cards horizontally, others vertically.

I used bright wire screw-hooks to hold the cards in place on the rack. This rack will hold about 16,000 post-cards, which provides for a large assortment of local, birthday, comic, and other kinds of cards. Customers coming into the store cannot fail to see it; they can walk around it, selecting here and there the cards they wish, paying the clerk as they pass out.

The illustration of the display of Thanksgiving cards shows another method I use for display. Sometimes the cards are placed in the window, again just outside the door, to draw the attention of passers-by.

This display frame is easily made of old boards with a heavy 2½-inch molding around the edges. The center is covered with any colored cloth desired, while the molding is covered with white enamel paint. With this frame one can make many different arrangements of cards, and effective ones as well.

I make frequent window displays; if the

POST CARDS, DRUGS, CANDY.</p>	<p><small>This space is for the Address Only</small></p>	

Using unsalable post-cards to advertise the line, this text being printed on the front side.

subject be something novel and out of the ordinary, so much the better, as it attracts more attention. One ought to make big displays of Thanksgiving, Christmas, and Easter cards, as they are the largest sellers.

The photograph of an air-ship shows one of the window displays that drew much attention to my line of post-cards and brought many sales. This air-ship occupied so much space

in my window that I took it out in the back yard to be photographed.

It was easily constructed, requiring more time than materials in the building. The cylindrical part representing the gas-bag of an air-ship was made by cutting out circular pieces of wood and holding them in place by thin strips of wood bent to give the proper shape. The post-cards are then attached by means of strings and tacks. The lower framework, for the support of the rudder and basket, was made from light wood strips colored with alabastine. This framework and the passenger basket were held in place with small brass chains, easily purchased at any hardware store.

How to construct the propeller and keep it in motion was the hardest problem. I solved that by taking a square piece of tin, cutting and folding it just as children do in making paper pin-wheels. This was then attached to the framework of the air-ship in such a way as to be easily kept in motion by the breeze from an electric fan.

A doll or two placed in the basket as passengers, a couple of flags to give added life, were all that were needed, and the air-ship was ready for business. A few printed cards were

tention and sold many cards was a penny post-card sale arranged in the window to represent a huge funnel.

I cut out of cardboard a circular piece and printed on one side of it as good an imitation as I could of the reverse side of a copper cent,

A display rack that may be set in the window or the doorway.

with the words on it "One Cent." This sign I placed in the center of the window, on a line with the eye from the sidewalk, about six feet from the glass. Then I ran many strings from the circumference of this sign to edges of the window. These strings were then filled with cards, and when completed gave the person looking in from the street the impression they were looking into a large funnel. I dropped an electric light inside this funnel to light it up at night, and the display proved very effective in drawing attention to my line of post-cards. It sold many of them.

SPECIAL POST-CARD SALES.

Every store nowadays has special sales of some sort. Why not have special sales of post-cards? An idea that is worth trying is to purchase a good line of holiday cards, like St. Patrick's, Decoration Day, George Washington Day, and Fourth of July cards, costing possibly 50 cents a hundred, putting a stamp on each one, then displaying and selling them for 2 for 5 cents. This can be easily done, giving a good profit, and still be a little out of the ordinary.

An "air-ship" display of post-cards. It was arranged in the yard and then suspended in the window.

placed in the window to call attention to the sale: "Mail Your Post-cards by Air-ship." "We Sell Stamps." "Up-to-Date Post-cards." "Giant Rack Inside, Come In."

ANOTHER WINDOW DISPLAY.

One of the very best ideas I ever used for a window display and one that drew lots of at-

There are always a certain number of cards in every assortment that prove to be slow sellers and accumulate in stock. It is not wise to let them stand in the rack too long, as customers soon tire of seeing the same cards. This is a point not to be overlooked in selling post-cards: keep changing the arrangement of your assortment and

freshen up the stock with new cards as often as possible.

One good way to dispose of the "stickers" is to have some advertisement printed on them and give them away at fairs, socials, circuses, etc. They can also be placed in packages leaving the store, in this way drawing attention to your stock of cards.

PUSHING YOUR OWN TOILET PREPARATIONS.

The Importance of Having Superior Quality in Such Specialties—Pointers about the Containers—Methods of Furthering Sales—The Profit in the Line.

By E. E. CALKINS.*

I will have to admit that I am not writing on this topic because I feel that I have been more successful than other druggists along this line, but because the subject was assigned to me at the last meeting. Yet I am willing to state the results of my experience as a basis for your discussion.

QUALITY FIRST.

My reasons for pushing my own preparations are purely selfish, I assure you. I have no great discoveries which I feel in duty bound to distribute to suffering humanity. I have only a desire to sell some things that can be sold by no one else, that must be purchased at my store, that will therefore bring people to my pharmacy if they like and want them, and that, being of high quality, shall advertise to the users my skill as a dispenser of things pharmaceutical. This being the case, quality is of first importance.

My cold cream must be as good as the best so that I and my clerks can look a woman in the eye and say: "Madam, this is a good cold cream. It is made of the very purest materials. It will not turn rancid. It is of delightful consistency and I am sure that you will like it." If it is good, the woman will want more, will recommend it to her friends, and will come to me for other things. A preparation which is not a repeater is a waste of time and energy and, if recommended by you, gives the lie to what you tell your customers about it.

LOOK CAREFULLY TO THE CONTAINER.

The package is next in importance. A cold

cream jar which is not convenient to open and close, or which is so deep that the contents cannot be easily taken from the bottom, will prevent future sales. A package which is not neat in appearance is not wanted on the dressing table. A tin can may do for use behind the scenes at a theatre, but for home use the neatest, daintiest package you can find is none too good.

In my experience I have not found it necessary to use a carton. A package which is to be shipped from factory to retailers and be carried long upon the shelf may need this protection, but your own packages should always have a new, fresh appearance, as though they had not been made long enough to accumulate dust. Better put the cost of the carton into the lithographed label or the jar—or keep it yourself.

NINE METHODS OF PUSHING SPECIALTIES.

There are many ways of pushing your own preparations:

First and foremost is personal push and salesmanship.

Second, the active coöperation of your clerks, secured by commissions or otherwise.

Third, prominent displays in the store, not necessarily in large quantities, but so placed that customers must see the goods and the price-cards attached.

Fourth, window displays and placards.

Fifth, frequent mention in your newspaper or other advertisements.

Sixth, folders for enclosure with packages and monthly statements, or for distribution to names on select mailing lists.

Seventh, gifts to customers of full-size

*A paper read at the last meeting of the Michigan State Pharmaceutical Association.

packages when they make purchases or pay their accounts.

Eighth, by the distribution of small samples. If samples of your preparations will not help to sell them, there is something wrong with the goods. Many a time a customer will say, "Oh, yes, I had a sample of that, I will take it."

Ninth, by using a product as a leader at a cut price for one or more days, either alone or in combination with staple articles. Special sales always appeal to women.

THE PROFIT.

Will it pay? Yes, it will, even if you spend all your profits on the article in introducing it as outlined in the foregoing ways. You can talk quality in advertised goods, but your competitor has the same goods. When, however,

you talk quality on your own preparation, and your customer finds that your claims are true, you have made an impression upon her mind that will make her think of you when she wants quality.

Often those things which are not directly profitable are so indirectly. Very few of you can point to a newspaper advertisement which sold enough goods to pay the cost of the ad., but advertising does help our business and the greatest enterprises are built upon advertising. Just so, it pays us to push certain toilet specialties for the sake of the indirect effect upon our business.

But direct profits should also be produced. Surely your own preparations need not cost you two, four and eight dollars, even if they are as good as others which do cost you that much.

TRAVELING IN PERSIA.

Pharmacies Needed in that Country—Conditions there Make Medical Treatment Difficult—Glimpses of that Far-off Asiatic Nation.

Tabriz, Persia, is, practically speaking, a continuation of the Caucasus which belongs to Russia. Russian influence is so prevalent in the north of Persia that after one has

meals start with mutton in the morning, have mutton during the day, and end with mutton in the evening.

Tabriz has a population of 300,000 people. The foreign colony is very small. There are four pharmacies, some 20 European and

Auto-bus for carrying passengers between Djoulfa on the Russian-Persian frontier and Tabriz, Persia.

stayed in Tabriz a few days he cannot help noticing that everything connected with trade and industry is controlled by Russia.

The Persian houses are situated behind high, gloomy walls cutting off life from the street. Every woman in Persia looks like a moving bundle of humanity covered from head to toe with a black fabric. As for food,

Medicine chest with inscription in the Persian language presented by Parke, Davis & Co. to His Imperial Majesty, the Shah of Persia.

American physicians, and 50 native "healers." There is a large opening for European pharmacies, without which medical treatment is very difficult. As matters stand at present

every European and American physician is compelled to carry a stock of pharmaceutical

Mr. D. A. Ruffmann (sitting), the manager of the St. Petersburg branch of Parke, Davis & Co., and Prince Eristoff (standing), representative of that house for the Caucasus and Persia

preparations for dispensing directly to the

patient. Persia being far away from the source of supply of these preparations, one can imagine the grave situation. Only after properly equipped pharmacies have been opened will it be possible for a number of European physicians to settle down in Persia. The Persian government raises no obstacles whatsoever against foreigners who desire either to open pharmacies or practice medicine there.

The Caucasian Pharmaceutical Society of Tiflis is about to open a wholesale and retail drug store in Tabriz. Of course that will induce Europeans to open pharmacies, as it will be handy to draw supplies from the Caucasian Pharmaceutical Society.

These facts are sent us by D. A. Ruffmann, Russian representative of Parke, Davis & Co., who recently took a trip into Persia. Mr. Ruffmann called upon the Governor-General and handed to him a beautiful medicine chest for presentation to the Shah. An illustration of the chest will be seen in one of the accompanying engravings.

A HALLOWE'EN CORN-CURE WINDOW.

B. S. Cooban of Chicago got up a corn-cure window during Hallowe'en week last year, and he is authority for the statement that it attracted a great deal of attention at

out of which in the proper region a corn had sprouted into quite a good-sized stalk. Elsewhere throughout the window were packages of the Cooban corn cure, placed on the win-

the time. The window itself is shown in the accompanying engraving. Corn on the stalk furnished the basis of the display. At either end of the window was a Jack-o'-lantern. In the center, a little at the left, was an old shoe,

dow floor, and fastened to the cornstalks themselves. A legend painted in white on the window-pane itself read: "Cooban's Corn Cure." An abundance of foliage was used in the display.

SELLING GOODS BY TELEPHONE.

How a Retail Druggist Can Obtain Business Over the Wire—The Need of a Delivery Service—Soliciting Telephone Orders—Calling Up the Doctors Regularly—A Simple but Effective System of Advertising.

By F. G. EBNER.

The druggist of to-day is always on the alert to acquire new ways of reaching out for new business. The telephone, the much criticised instrument, the much abused silent util-

BROWN, Apothecary.

Telephone No. 123.

Dear Madam:—

We realize that you are busy at times with household duties and a thousand and one other things. You need a drug or something in our line. Maybe a sundry for the sick-room or a toilet necessity. You may want a hot-water bottle, or something else; if you desire several to pick from, I shall gladly send you an assortment and you can make your choice. Select one that will meet your need in quality, price, and style. I shall deliver anything right away. Right away means immediately with me.

Trusting I may be of service to you when you are in need of anything in a hurry, I am,

Yours very truly,

BROWN, The Druggist.

A personal letter soliciting telephone orders.

ity, has been the means of getting more business in many lines of commercial work, but probably has not been utilized to its fullest extent by the drug retailer of to-day.

We hear many criticisms in this day and age about the telephone; along with every good thing in this world we find its abuses. We know this is true about drugs; naturally the telephone falls heir to its share.

GETTING BUSINESS OVER THE TELEPHONE.

The telephone with all the bad things said about it can be made a paying instrument and

When you want a drug or a sick-room help you want it right away. Telephone Brown 123.

For drugs,
Telephone Brown 123

Newspaper liners soliciting telephone orders.

a means of adding many a dollar to the profit side of the account, if the retailer will take advantage of the opportunity; with drugs and sick-room requisites, people generally want them in a hurry, and when they are in a hurry the telephone is the means of connecting them with the drug store.

A retailer in any part of the city can cater to a telephone trade. But it is very difficult to get people into your store if you are located in a remote part of the city.

There is a great possibility of increasing one's trade by means of this channel; but there are several necessary qualifications:

First of all, the dealer must have a good delivery service, if he intends to hold the trade. By a good delivery service, I mean prompt and immediate delivery. Drug parcels are seldom so large that they cannot be carried by a boy on a bicycle. The first essential is to have a good delivery service; the second essential is to advertise the fact thoroughly and constantly.

The newspaper is a good medium to bring the facts before the people. Typewritten circulars addressed to the people is another valuable means of acquainting them with your telephone methods of doing business. Street-car advertising is a paying investment for any man who intends to carry out this method of getting business.

CALLING UP HOTEL AND MEDICAL MEN.

One retailer I have in mind has a small card printed as follows:

TELEPHONE

Your drug wants.

We deliver immediately.

BROWN, the druggist.

Telephone 123.

This card is placed in every room in the hotels of the city. In some of the larger hotels a telephone is found in every room, and the suggestion is the means of winning trade in this way.

This same dealer carries an ad. on every page of the telephone directory.

To those who are catering to physicians' trade, it is the means of corraling trade that might go elsewhere.

One merchant I know of has for one of the duties of the clerk to call up all physicians

and ask if there is anything wanted in the drug line. There are several hospitals and a county home and he includes these institutions in his daily calls.

This man has created a trade that could not have been reached otherwise. By these telephone inquiries he has won the physicians over and made them good customers.

PERMANENCE OF ASTRINGENT PREPARATIONS.

The Results of an Investigation Extending Over Three Years—Undertaken to Show the Stability of Tannin-containing Fluidextracts and Tinctures—The Necessity of Strongly Alcoholic Menstrua for Such Preparations Clearly Indicated.*

By WILBUR L. SCOVILLE,

Of the Scientific Staff of Parke, Davis & Co.

In March, 1908, a series of fluidextracts of drugs which contain considerable amounts of tannin were prepared for the purpose of studying the stability of the tannin in such preparations. Each was freshly made and was tested as soon as possible after finishing.

The Loewenthal method of estimating tannin was first tried. With some the results were satisfactory, so far as the operation of this process is concerned, but with others it was impossible to get any end-point, and the method was abandoned. From this and subsequent experiences the writer believes that no one method can be applied satisfactorily to all kinds of tannin-containing material, because tannin, as the term is used, stands not for a definite substance, but for a class of substances, ranging from chlorogenic acid to true tannic acid. For specific kinds of tannins, as for the treatment of leather, tests which are adapted to that purpose can be made very satisfactory, but it will be readily understood that for other kinds of tannoid bodies such a test may entirely fail.

After some study and experimentation it was decided to use two methods, found in Allen's Organic Analysis, 3rd edition, Vol. III, Part 1.

THE FIRST METHOD OF ASSAY.

The first method, devised by F. Jean, consists in matching the color produced with a weak solution of ferric chloride and a tannic acid solution of known strength, with a dilution of the fluidextract under examination.

*Presented to the Scientific Section of the American Pharmaceutical Association at the Boston meeting in August.

As in all colorimetric processes, this will vary not only with the personal equation, but in different lights, and with colored solutions.

The fluidextracts were each diluted 1 Cc. to 99 Cc. of water for this test. When fresh, each produced a marked cloudiness with water, but, after aging, some specimens mixed clear with water and all were more miscible than at first. It was not thought best to clarify these solutions any further than by simple filtration through paper, so in the earlier tests a greater degree of cloudiness was contended with than in the later tests. This will account in part at least for the higher results often obtained by this method on the preparations after they had stood for a time.

It is scarcely necessary to point out that this method will estimate not only tannins, but also gallic acid (if present), and any principle which will give a dark color with ferric chloride. It has, however, the advantage of rapidity, and for tests in series on the same liquid it may be expected to show whether any marked changes have taken place in these principles on standing.

THE SECOND METHOD.

The second method, devised by Collin and Benoist, aims to measure the amount of weak tannin solution required to precipitate all of the gelatin from a definite gelatin solution. The end-point on this method is found in the disappearance of a blue color which is added to the gelatin solution, and is aided by the appearance of the precipitate.

In this process much depends upon close attention to certain details, more, in fact, than

was realized in the earlier tests. The gelatin solution must be very hot (80° C.), the tannin must be added very slowly and mixed quickly, and the reaction of both solutions must be alkaline but faintly so. Since alkalies split up tannins, this last is a fatal point for very accurate work, particularly with colored solutions.

The process, however, distinguishes between tannic and gallic acids, and excludes also other principles which give a dark color with ferric chloride. It thus serves as a check upon the first process.

It may be charged that two inaccurate processes cannot make an accurate one. This is certainly true, and the most that can be claimed for the results given below, is that they may show, with a fair degree of certainty, whether marked changes have occurred in the preparations during the three years they have been kept.

The writer wishes to state that his respect for tannin estimations has not been increased any by this work, and that while in the light of an accumulated experience more uniform results might be obtained by a repetition of the work, yet a liberal allowance would need to be made for results by these methods.

THE RESULTS.

The results in the following table are expressed in percentages as a matter of clearness and convenience, but it is highly improbable that the percentages represent actual proportions of tannin. In each series, blanks were used with a solution of pure tannic acid of known strength, and the calculations based upon the figures obtained at the time, but the results with pure tannic acid varied. Differences in the light will account for variations

in the first process, and differences in the gelatin solution and in alkalinity will account for the variations in the second process.

It will be noticed that the results by the gelatin process on the first assay are usually much higher than on subsequent tests, usually about twice as high as the second test. Since the gelatin solution was prepared fresh each time, I cannot account for this except on the supposition that some change takes place in tannin solutions very quickly. And since the U. S. P. nutgall fluidextract is the only one that is made without water in the menstruum, and the aqueous fluidextract of nutgalls corresponds in this respect to the other preparations, it would seem that a hydrolysis takes place. This is further borne out by the fact that the preparations which are weakest in alcohol (chestnut, uva ursi, wild cherry and witch-hazel) show the most rapid change.

Indeed, the most profitable suggestion from this study is that tannin preparations should be strongly alcoholic in order to be permanent, and, conversely, preparations which are undesirably astringent may be rapidly freed from tannin by using a weakly alcoholic menstruum. Thus a fresh fluidextract of wild cherry is strongly astringent, but after standing a few weeks it will lose most of this astringency and become more miscible with aqueous fluids.

Glycerin does not appear to hinder or prevent this change as does alcohol, the aqueous fluidextract of nutgalls being made with a menstruum of 60-per-cent glycerin by volume.

AT THE END OF THREE YEARS.

The physical conditions of the fluidextracts at the end of three years are interesting. The fluidextracts of bayberry, logwood, nutgalls

(U. S. P.), sumac, rhatany, white oak and white pond lily, and the tinctures of gambir and kino are nearly clear or contain only a very slight precipitate. Fluidextracts of bayberry and rhatany show no precipitate, but they seem to have thickened a little and suggest the gelatinizing process.

Fluidextracts of blackberry, chestnut, jambul, aqueous nutgalls, rose, uva ursi, wild cherry, and witch-hazel have precipitated badly, and in most cases the precipitate has caked together. Fluidextract of geranium gelatinized after about two years.

Of the 19 preparations, the tinctures of gambir and kino, and the fluidextract of nutgalls, are the only ones in which no material change is evident in three years.

The fluidextracts of bayberry, blackberry, chestnut, jambul, logwood, rhatany, rose, white oak and white pond lily kept well for two years, but signs of deterioration now appear in these, though positive conclusions should not be drawn from the last tests. No positive conclusions are drawn for these preparations.

Fluidextracts of geranium, aqueous nutgalls, sumac, uva ursi, wild cherry and witch-hazel show an unmistakable loss of astringency, and mostly within a year. Geranium kept about two years, and then gelatinized, and it will be noticed that the tests within three months of gelatinizing showed a marked and sudden reduction in tannin. Aqueous nutgalls shows evidence of the tannin rapidly changing into gallic acid.

Wild cherry loses its astringency quite rapidly, sumac, uva ursi, and witch-hazel more slowly.

Gelatinization does not take place until the tannin is all changed, and a preparation which will gelatinize finally may have lost most of its astringency without changing its physical appearance. Precipitation may occur to a considerable extent without loss of astringency. But the use of strongly alcoholic menstrua for astringent preparations is strongly suggested.

Two fluidextracts of cinnamon were included (Cassia and Ceylon cinnamon) in the investigation, but the estimation of tannin in the fresh preparations was so unsatisfactory that definite records could not be obtained. Evidently the tannoid bodies in cinnamon are not true tannic acid.

Laboratory of Parke, Davis, & Co., Detroit, Mich.

DOLLAR IDEAS

AN ECONOMICAL MATCH DISTRIBUTOR.

H. Kallivoda, Jr., Los Angeles, Cal.: Match fiends are a drain on most cigar departments and this little scheme does its work well. Take a regular 5-cent pack of matches and make a V-shaped incision about 1½ inches long from

both sides of the box. Pass a rubber band around the box to prevent its opening as shown in the illustration. This saves many matches, as a customer can pick up only one or two at a time instead of a handful. The device has meant many a dollar to me.

AN IMPROVISED SCOOP.

H. E. Read, Altamont, Kansas: Scoops are sometimes very scarce in the drug store. In fact one never has enough for all the different articles that are handled with this utensil.

Here is a method whereby every one may

obtain scoops for nothing. Get a tin can or round pasteboard box or any kind of a container varying in capacity from ¼ to 2 pounds or even more. Take a pair of shears and cut the container along the dotted lines as shown in the illustration. Presto, you have a scoop! You can use the pasteboard kind until they are spoiled and then throw them away. But

the tin scoops last about as long as the cheap ones sold in the market.

This is a good method of utilizing empty tins that are otherwise thrown into the alley. The illustration shows a handle, but the scoop can be used about as well without one.

A HANDY CAPSULE ARRANGEMENT FOR THE PRESCRIPTION COUNTER.

E. L. Gaudet, Tallulah, La.: Here is a handy capsule arrangement for the prescription counter. I take nine empty capsule boxes that hold 100 apiece—such containers as Parke, Davis & Co. supply. I then select the 00 size. To this I stick on top the box holding the 0 size, and upon this in turn I paste size 1 with, say, royal glue; and so on until the No. 5 box is reached. This completes a pyramid of boxes. Next I wrap some adhesive tape around these containers twice from top to bottom along the sides to strengthen the arrangement, and then place it near the prescription scale. To replenish the stock of capsules, slide the old container out and slip in the new. I always keep such an arrangement on my prescription counter.

RESETTING HANDLES IN PESTLES.

Ernest W. Henderson, Lynn, Mass.: Pharmacists often experience much trouble in resetting handles in pestles after they have become loosened. I hit upon an idea a few months ago, which has proved very successful, after trying all the formulas that the store library afforded.

Remove the handle from the pestle and clean the adhering particle of cement from the hole and the end of the handle. Wind several layers of gauze around the end of the handle, and, having poured a small quantity of Canadian turpentine into the pestle-hole, press the handle firmly into place. In an hour or two it will have become sufficiently set to use.

STRETCHING RUBBER TUBING.

C. K. Bushey, Dillsburg, Pa.: Often a good deal of trouble is experienced in trying to fit a rubber hose or bulb over a pipe connection, valve, etc., by not being able to stretch the

rubber enough. et hat the rubber by inserting the end to be stave and in warm water, not too hot. This incre the elasticity of the rubber, and the cck Iction can be easily made where it seem har possible before.

a get
he

A TIP IN FILLING CAPSULES.

Clyde S. Leslie, Ewing, Mo.: In dispensing powders that are to be put into capsules, such as Dover's, quinine, etc., often there is hardly enough powder to completely fill each capsule. By simply catching the capsule between the thumb and forefinger, pressing it lightly and rolling it, the powder can be forced into each end of the capsule, apparently filling it, thereby giving it a much neater appearance than it would have partly filled.

A QUICK STRAINER.

S. T. McGee, South Berkeley, Cal.: In straining a liquid, I have found it very convenient to fasten the cloth to the sides of the funnel by means of three or four spring-clasp clothes-pins. These pins hold the cloth up well, thus giving fullest speed to the straining and saving the time of fastening cloth to a frame and holding it above the funnel.

Radium Treatments.—

Radium treatments by emanation have arrived at the stage of a special apparatus, recently exhibited before the British Pharmaceutical Conference by Gardner & Elias. Radium emanations, which are gaseous and do not penetrate the skin, are absorbed through the lungs, and are being employed for the treatment of gout and rheumatism. The emanations are rapidly eliminated, usually passing out of the body in an hour or two after treatment. Radioactive water, used as baths, continental mud-baths, etc., owe their effects to radium emanations which are absorbed entirely through the lungs.

Radium radiations, which differ from emanations in being solid instead of gaseous, will penetrate the skin and are employed by exposing the parts to the action of radium salts, usually the bromide. It is calculated that 1 grain of radium bromide emits about 10,000,000 alpha particles per second, and about a quarter as many beta particles. The latter have a velocity of about 170,000 miles per second and penetrate the skin readily. These are used in the treatment of epitheliomas, cancerous growths, etc., and require only thin metal screens in applying to prevent the destructive action of the alpha rays on the tissues. Their value is not yet fully established.

SOME OF MY EXPERIENCES WITH CLERKS.

To the Editors:

Personally, I enjoy the "experience" talks by brother druggists in the columns of the BULLETIN more than anything else. So here goes:

My first clerk was an old man who knew nothing about the drug business, but he was energetic and a good "mixer" and prompt and reliable. He was a retired farmer, had plenty of money, and simply worked for me as a matter of accommodation to me. He was quick about waiting on trade, good about keeping things clean, and a model clerk but for one thing. He was a natural-born crank. He had ideas of his own, and, while he was generally right in his contentions, he was too pronounced in his assertions. He would argue with any one over anything and carried it to extremes, making many people "sore." I kept him over a year, but had to let him go.

My next clerk was a boy who had never had any experience in store work of any kind. He had just finished high school and was green as grass, but was a good worker. He wasn't of much account for some time, but gradually caught on and became a good clerk. He was energetic, sober and reliable, and was a good stock-keeper and pleasant to the trade. He stayed with me for about three years, finally leaving to enter a business college. Later he took a course in a pharmacy school. He is now running a store of his own in Kansas City, Mo., and is doing well.

One clerk I had was a man 40 or 45 years old, of rather prepossessing appearance, and with some four or five years' experience as a drug clerk. He was industrious and reliable, but of a peculiar disposition, hard to get acquainted with, and slow to make friends. I kept him only three months and had to let him go, as he was losing trade for me instead of making it. When I told him I would have to let him go he could hardly believe it, and the tears came in his eyes as he asked me why. I told him.

Another clerk I had pulled off the society stunt. He had not been in town a month until he was "in" with the best people in the town, went to all the swell dances, receptions,

etc., and generally flew high. He was a good clerk too, but he couldn't keep up with his salary, or rather his salary couldn't keep up with him.

At the end of a few months he was a month ahead of it. I told him he was going too strong several times, but finally I had to let him go, as I could not pay him enough to keep up his gait. He did not ask for an increase, but seemed to think it was all right to draw ahead as far as he wanted to.

Then I had another clerk, a good druggist too, who could fill any prescription and make up any preparation and was reliable in every way. But he would never clean a window or a show-case unless he was told to. He seemed to think it was not his business to put things on the order book or straighten up anything. I put up with him for over a year. Then he got an offer of more money at another store and I let him go. He only stuck there a few months, and has worked in a dozen places since.

One clerk I had was a nice looking young man, of good family, and well recommended. He was a pleasant, sociable fellow, a good mixer, kept good company, and made friends for the store. I congratulated myself on having a really good clerk.

One morning he failed to show up at the accustomed hour. He sent word that he was sick and could not come on until after dinner. About noon one of the boys came in and said: "That clerk of yours was on 'a big hurrah' last night."

I could hardly believe it, but when his folks came in and asked where he was and said he had not been home the night before, I concluded there must be something to it.

He didn't show up that afternoon nor the next forenoon, but after dinner he came in, looking very much the worse for wear and very dejected and humiliated. He put up a grand-stand talk that he had never done such a thing before in his life, never would again, etc.

I told him there was no use. He couldn't work for me any more. That night his folks came in and put up such a strong plea that I relented and told them I would give him another chance.

He came back the next morning and went to work as if nothing had happened and gave good satisfaction for about two months. One

night—it was his night to close up—he was at the store by himself, and the next morning I noticed the sales were made up very irregularly. While I was trying to straighten them out, a young fellow, a friend of mine, came in and said: "Bill got me to make up the sales for him last night. He was shot up again. He asked me not to say anything about it, but I couldn't understand about making up the sales and I thought I had better come around and tell you about it. The money is all there."

This time he didn't "come out of it" for three days. I didn't expect him to return to his job, but he did. I told him there was absolutely no use. Again he made all kinds of promises, but I told him he was wasting his breath. His folks came again and pleaded for the poor boy, and he was with them and "turned on the water works," but to no avail.

They said he had an offer from another drug store up the street, but they would rather he would work for me. I told them, "By all means let him take the job," but I noticed he didn't. He is now making good on a farm, out of the way of temptation.

One clerk fooled me decidedly. His folks wanted me to give him a try-out, and as I was short of help at the time I put him on. He had had two or three years' experience and knew the business well—that is, the theory end of it—as he was a graduate of a college and also had just finished a course in a pharmacy school. He was a good stock-keeper, kept things up in good shape, was always cleaning up, and punctual and energetic to a fault.

There was one trouble with him, though. He always met a customer with a grin on his face, and his attempts to be pleasant were really pathetic. He tried so hard to be nice to everybody and to make a good impression that he overdid it. Everybody got to calling him "grinny," and he didn't take at all. I kept him three or four months, but had to let him go. He got a job in another town and took the State examination and passed with a high grade.

He is now manager of the largest drug store in the largest town in the State. I was certainly fooled in him.

Then I had another clerk who was with me nearly four years and was a good one too, but developed a fondness for the "spts. vini rect.,"

and I had to let him go. He simply got so he could not leave alcohol alone.

I don't believe that I am hard to work for. In fact, I think I am too easy, but it does seem to be a hard job to get a satisfactory clerk. If you get a really good one, one you want to keep, he gets an offer somewhere that you can't meet. There are so many that start out fine but soon fizzle out.

AN OLD PILL-ROLLER.

SOME VIEWS ON THE GRADUATION PREREQUISITE.

To the Editors:

There are reasons for not making a college course a prerequisite. Comparing pharmacy with the medical, dental, and veterinary professions, there is a real need at least among medical students for a college course. They must learn the anatomy of the human body. A similar rule applies to the dentist and veterinarian also. But the pharmacist need not know all about the human system to be able to compound and dispense medicines accurately. We druggists know well that the only way one can learn pharmacy is to get right down and dig it out himself. A man might stay in a college of pharmacy until his hair is white, but without active practice he can never master the work. The average drug store has nearly all the facilities one needs with which to study pharmacy, and with a little added expense one can equip himself well enough to carry on any experiments he may desire. And this work, coupled with the drug experience, affords in my estimation a better training than the college where one gets theory only. Neither the doctor, dentist nor veterinarian can accomplish so much in an office.

As to the efficiency that may be attained without a college course, we need not say much about that. It has been well demonstrated, too often to be doubted, that a prerequisite requirement is not entirely necessary. I personally know a few men who never attended a college, but have held positions behind the prescription cases of some of the best drug stores in the United States.

Again there are many boys who enter the drug stores and make excellent druggists, who would be barred from the profession if they had to go through college, for the reason that they have not the necessary funds. A gradu-

ation prerequisite would exclude from the profession many of our best pharmacists. So I say give everybody a chance. True, a college course is beneficial and makes the road easier. I admit that one can never learn too much about the profession. But a young man with ambition can acquire the necessary training outside of a college of pharmacy.

We have our State board, which can make the examination sufficiently rigid so that those who pass it must be competent. And so long as one is able to do the work what difference does it make whether he obtained his training in a college or a store? It is all up to the individual. A prerequisite requirement will exclude many boys from the profession, and, secondly, in view of our State boards, which are competent, such a law is unnecessary.

Eastman, Georgia.

B. I. BRANTLEY.

HE DOES BELIEVE IN FIVE-CENT SALES— A LITTLE ARGUMENT.

To the Editors:

In your August issue, among the "Letters," I noticed an article entitled "Doesn't Believe in 5-cent Sales."

Without giving offense to the writer, I venture to say that even though he did not sign the name of the city in which he resides I would have known he hailed from one of the larger cities—that is, one over 30,000 inhabitants.

Just such ideas as he expresses tend to make the public look upon the pharmacist as an independent, fast-money-making individual. Every other business—mind you, *business*, not profession—deals out 5 cents' worth of material if wanted.

During my short experience of sixteen years in pharmacy, in a city of 25,000, I have found that 5-cent sales are money-makers *indirectly*. Treat a 5-cent customer right and you get the 25-cent, 50-cent, and dollar sales when he wants them.

Give a customer wishing 5 cents' worth of anything, just 5 cents' worth and no more, and the next time he will buy a larger quantity. I can name a number of grocers and men in other lines of business who have made good dealing out and *cheerfully* filling 5-cent orders. I don't mean to encourage 5-cent sales, but I treat the buyers right and sell 5 cents' worth when asked for it. That sen-

tence of Junius Pestle, "Cut out 5-cent sales," rings false.

The pharmacy proprietor, not always the clerk, looks with disdain on 5-cent sales. No one realizes more than the clerk the hard task of selling a \$9.00 a dozen patent, wrapping it, and delivering it, all with a pleasant face, to a customer for 77 or 78 cents, leaving a profit of 2 or 3 cents. Drill your clerk (take it from a clerk like myself) to treat all customers properly, 5-cent ones preferred.

Mr. Junius Pestle, let me suggest that you try a 5-cent window trim some time. My boss looked upon it as all wrong. One day, while he was away, I filled our windows with articles selling for 5 cents—no more. Among them were toothpicks, ink, court plaster, vaselin, mucilage, soaps, ripans, nursing bottles, paper drinking cups, a job lot of talcum, and toilet paper—one or two of each. You could find many similar odds and ends in your store. Each group had a 5-cent tag on it. In the center of the window I placed a large card: "Any Article 5 cents."

The display brought many new customers. One said, "Well, I never knew you carried Coal Oil Johnny Soap. I'll take three cakes." Another said, "A bottle of ink, please." At this point the good, pleasant clerk steps up and with tact and a smile suggests a tour of the stationery counter, showing the excellent line of paper, pens, pads, etc.

Just try it and see!

Like any window trim, such a display doesn't always sell goods on the spot, but suggests sales that materialize later on. Many of our window trims have attracted people who did not purchase at that moment, but later. Send 50 people to our store for something worth five cents, and I am certainly a poor salesman if I don't sell 5 or 10 cents' worth more to 25 out of the 50.

If a customer asks for *some* Epsom salts, or Castile soap, Mr. Clerk ought to, I agree, say "Ten cents' worth?" or "A ten-cent cake?" But if a person wants 5 cents' worth, give it to him. Try it. But do it pleasantly, not as though you were doing one a favor. You will find that most clerks, experienced clerks, will do that; but I have noticed that the proprietors, some of the get-rich-quick kind, hate to make 5-cent sales, and they certainly show it, too!

I hope that pharmacists will wake up to the

fact that 5-cent sales—that is, all small sales—made right, will or do invite larger sales, and that more good-will, and in the end profit, comes from them than from some of the larger sales.

"THE CLERK."

WHAT IS YOUR METHOD OF DISPENSING PRESCRIPTIONS?

To the Editors:

Will you not have readers of the BULLETIN OF PHARMACY submit sets of rules such as govern the filling of prescriptions in their stores? Routine and system are essential in the prescription room. A few sets of rules actually in operation would be of greater assistance than years of experimentation and resultant changes. Incidentally let me ask: When is the best time to write the prescription label—before filling the order or afterwards?

In order to make it perfectly clear what I mean, I am submitting herewith a set of rules suggested by a druggist of many years of successful experience:

RULES GOVERNING THE COMPOUNDING OF PRESCRIPTIONS.

- 1st. Read the prescription carefully.
- 2d. Write the label or labels therefor, affixing date to same.
- 3d. Select the ingredients entering into the prescription, together with container.
- 4th. Compound and finish off,
- 5th Call back prescription from memory to some qualified person in attendance, who will verify same, affixing his initial or number thereto.
- 6th. All active poisons must be verified as to kind and quantity by a second person in attendance.

Now I wish you would please ask your readers to submit rules of this kind which they have developed out of their experience, and which they have found to be useful in the prescription room. Hoping to get something good from this stirring up, and wishing the BULLETIN every success, which it so richly deserves, I remain,

W. C. M. SCOTT.

Detroit, Mich.

[NOTE BY THE EDITORS.—Mr. Scott's suggestion is a good one, and we certainly trust that our readers will avail themselves of this invitation and send us a number of contributions on the subject. Let us hear from you for the benefit of the craft! The more responses we get, the better we shall be satisfied.]

DEALING WITH THE DISPENSING DOCTOR.

To the Editors:

I notice that a great deal has been said lately in the columns of the pharmaceutical journals concerning dispensing by physicians and prescribing by pharmacists.

The custom of dispensing by physicians has prevailed in this section of the country for so many years that most druggists have come to accept it as an unalterable condition; but I have found that I could alter the condition to a great extent. My plan has been to not fight the physicians, but to try to convince them that it is to the mutual advantage of physician, patient, and druggist that they dispense as little as possible, and have their prescriptions filled at the drug store whenever it is practicable.

It is useless to expect a physician to send his patients twenty miles to a drug store to have a prescription filled for calomel powders; but I have had quite a number of prescriptions for such things as suppositories, emulsions, etc., brought to me by patients who live fifteen or twenty miles away. One of my physician friends uses his medicine case for emergencies only. He gives a patient something from his case to do until the patient can send to the drug store and have a prescription filled.

A patient once asked this physician why he did not dispense his own medicines himself. He rather tersely replied that when he dispensed his own medicines he gave the patient what he had; when he wrote a prescription he gave the patient what the patient needed.

I once bought out the stock of a dispensing physician, and had to throw away more than half of his stock as it was no good. Poor man! He had no idea why he did not get the results which he expected from his medicines!

So I say that if a physician can be so blind to his own interests as to dispense worthless preparations, why let him dispense them!

B. O. BERRY.

Saint Matthews, South Carolina.

TWO MORE LETTERS ON DISCOUNTING BILLS.

To the Editors:

We take advantage of all cash discounts that are offered.

Figuring the discounts on various lines, we find that they average one per cent.

The discount on drugs, patents, etc., is one per cent thirty days. On sundries we are allowed one to five per cent, but as the time is sixty to one hundred and twenty days, the discount averages one per cent. Or one per cent ten days or thirty days net means twelve per cent per year. This only goes to show that it pays one to avail himself of all cash discounts even if he must borrow the money to do it.

I have figured up our cash discounts for 1910, and they were ninety dollars at an average of one per cent. There were a few bills we did not discount, but very few. We discounted all our drug and sundry bills. The discounts paid three-fourths of our freight and drayage, and were we nearer the wholesale markets would pay them all.

I am a firm believer in the discounting of bills. It not only pays financially but in other ways. It is one of the best "references" one can have when opening an account with a firm to whom he is a stranger. For example, I get an invoice dated February 1 of fifty dollars "1 per cent ten days or thirty days net." I pay February 10 and add 50 cents to my profits. If on the other hand I had paid the bill on March 1 it would have cost me 50 cents for the use of that money twenty days. Pretty big interest! And I dare say in a majority of cases the money has laid in the safe or the bank. And I think further that taking thirty, sixty, or ninety days is more of a careless habit than good business. Perhaps it was easier for me because I got the cash discount habit from the start. The twelve per cent per year appealed to me.

Traverse City, Mich.

C. A. BUGBEE.

To the Editors:

We discount all bills. Thus we save from $\frac{1}{2}$ to 5 per cent.

Our capital is \$26,000, and we pay one or two per cent dividend with what we save in discounts. Druggists are certainly justified in borrowing money for the purpose of taking advantage of all discounts. We probably save in actual cash \$500 or \$600 a year.

Detroit, Mich.

F. W. R. PERRY.

INGENIOUS SPELLING!

To the Editors:

The accompanying note was sent to a drug store in Coshocton, Ohio, and may be interest-

*Doctors hoofbees
feal Mail fulls*

ing enough to use in the BULLETIN. It isn't very difficult to make out, but it struck me as being amusing.

W. H. MCKIBBEN.

RED INK FOR EXTERNAL PREPARATIONS.

To the Editors:

Here is a little suggestion for readers of the BULLETIN. I always use red ink for writing labels to be used on external preparations. Some druggists have their labels printed in red for external preparations, but this means duplication and expense. It seems to me that the writing of the labels in red ink serves the same purpose.

Eastman, Ga.

B. I. BRANTLEY.

To the Editors:

At this time I desire to add my praise for the best up-to-date drug journal that I receive, which is due in part to its progressive ideas and its systematic classification of subjects.

Youngstown, Ohio.

JAMES L. ANLIS.

* * *

To the Editors:

Since my graduation day in 1902 I have never been without your journal, and consider it "the real thing." It's "breezy," carries the real "dope," and prevents one from getting "rusty" north of 53° or south.

Fairbanks, Alaska.

W. MOLTZEN.

* * *

To the Editors:

The BULLETIN is, I think, the best pharmaceutical journal published, and I always look forward to its coming at the beginning of the month with interest.

W. R. BORNEMAN.

Mahanoy City, Pa.

BUSINESS HINTS

Pushing Shaving Supplies.—

It seems that the barbers in New Ulm, Minn., raised the price of a shave from ten to fifteen cents. The high cost of living no doubt accounted for this move, but nevertheless the rise in the cost of tonsorial service meant business for the drug store. Eugene A.

Price of Shaving Reduced

Why pay 15c. for a shave when by owning one of our new up-to-date Safety Razors you can shave yourself for a PENNY or even less,

Besides the saving of money you also will be able to Save Time, as then there will be no more long waiting for "N-E-X-T"

When you own a Safety you can shave yourself when YOU feel like it; be it early morn or late at night—It's all the same to Mr. Safety—He don't care when or how often you use him—He will always be ready at your every call, willing to give you the cleanest, most sanitary shave that your face ever enjoyed.

We handle all the standard makes of Safety Razors.

Durham Duplex Leslie Gillette
Auto Strip Ever Ready Etc.

Prices from \$1.00 to \$5.00 each.

We will be willing to let you have one on Trial just to show you what comfort there is in shaving yourself.

Also all necessities used in shaving.

The best of everything to be found at

Eugene A. Pfefferle's

Reliable Drug Store.

Pfefferle was not slow to see the chance. He at once came out in the *New Ulm Review*, a local paper, with an eighth page ad., surrounded by a heavy black border, announcing a full line of shaving supplies. That this bit of opportune advertising brought business to Pfefferle's Pharmacy goes without saying.

Teddy in the Window.—

Our attention has recently been directed to a rather unusual window display arranged by E. H. Smith,

1932 W. Superior Street, Duluth, Minn. Standing out conspicuously in the middle of the window appear a pair of glasses over a set of shiny white teeth. Just

beneath the white ivories rests a sign, "Delighted with Euthymol Tooth Paste." The whole idea is simple but exceedingly unique, and must have attracted attention to the tooth-paste on display.

Two Artistic Calendars.—

Alf J. Shilling, 36th and Cottage Grove Ave., Chicago, gives no little thought to his advertising. Among other things Mr. Shilling is in the habit of sending out monthly calendars to his customers. Two of them are reproduced in the accompanying engraving. The originals were $4\frac{3}{4}$ inches long and 10 inches wide.

Unfortunately the color effects are lost in the engraving, but the illustration will serve to indicate the artistic nature of the calendars. The paper was a white cardboard stock, the lettering being done in red and green.

A Post-card Envelope.—

Port-cards are commonly sold in envelopes, the idea being to keep them clean. Messrs. Wilkinson & Co., of Keokuk, Ia., use an envelope $6\frac{1}{2}$ by $3\frac{3}{8}$ inches in

ARE YOU PARTICULAR ABOUT YOUR TALCUM POWDER?

You can afford to be if you buy talcum powder and toilet goods here. We have every kind of talcum powder that is worth having, and our stock is always fresh, as we buy direct from the manufacturers and our large daily sales make "getting stale" impossible on our shelves. We guarantee everything you buy here to be perfect, and if you don't find it so we will gladly refund your money. Our large stock affords you the pleasure of buying just what you want and not being asked to take something you do not care for.

WILKINSON & CO.

KEOKUK'S BIGGEST, BUSIEST, AND BEST DRUG STORE
422 MAIN STREET

dimensions. The paper is of a comparatively thin, light yellow stock, and bears their ad. We are reproducing one of the envelopes which carries a talcum powder announcement.

CAPSULES OF SCIENCE

Prepared by PROF. W. L. SCOVILLE.

Show-case Items.—

Sodium naphthenate is said to increase the detergent and lathering power of hard soaps, and also to be strongly disinfectant.

Petroleum oil is found in 22 States. Pennsylvania leads with 2000 square miles of oil-bearing land. Indiana has 1000 square miles, and California 850. Idaho comes last with only 10 square miles.

Professor Zsigmondy says that fish bladder is superior to parchment or to collodion as a dialyzing medium.

Dr. McCollum, of the University of Wisconsin, says that the taste or flavor of a diet is found to have an important influence on its digestibility; a tasteless diet which contains all necessary nutrients being practically worthless for maintaining health and vigor.

A German chemist says that acacia which has been obtained by evaporating a filtered solution dissolves very quickly in water and produces a clear and permanent mucilage.

The active principle of insect powder is pyrethron, an ester of pyrethrol. It is highly poisonous to insects and fish, but not to higher animals.

Corn-stalks are a profitable source of sugar in Europe. They contain from 1.5 to 10 per cent of sucrose, and the sugar can be obtained in pure form.

"Anise bark oil" is distilled from the bark of the avocado pear. It has an odor and flavor resembling that of anise.

China and Japan have cultivated and used soy beans for centuries, but until within two years the rest of the world regarded them as a curiosity. Now it is exported in large amounts and its use is rapidly increasing.

The solubility of solids in water is increased by pressure, but the increase is so slight as to be of no importance except for most exact work.

A perfect solution of starch gives a violet wine color with iodine, a pseudo-solution gives the characteristic blue, and the insoluble particles a bluish-violet.

An alcoholic extract of the peel of red radishes is said to yield an indicator for acids and alkalies more sensitive than phenolphthalein.

House flies have been fed on a mixture of sugar and strychnine, and the strychnine had no effect on them.

Faded writings, if made with iron ink, may be restored by brushing with either a solution of tannic acid, or of ammonium sulphide.

Crystals of sodium nitrate are obtained pure enough to be used in optical instruments in place of Iceland spar.

Yeast is stated to be a good food—when deprived of its bitterness. It contains 48 per cent of digestible protein, and 75 per cent of its energy is utilized. It is one of the most concentrated of foods and one of the richest in protein.

The largest vessel yet made of silica is a 50-liter jar, 2½ feet high and 12 inches in diameter. Silica

is very difficult to work, but it is much superior to glass for chemical operations.

Preserved Gentian.—

Preparations are made in Europe of fresh gentian root by dialyzing two to three weeks in 60-per-cent alcohol. The fresh root contains more gentiopicroin than the dry, it being changed during the drying by action of the ferments in the root. And E. Bourquelot says that by extracting fresh gentian, kola, aconite, digitalis, etc., with hot alcohol, not only is a larger yield of active principles obtained, but a purer and more permanent extract is secured.

BOOKS

SCHIMPF'S ESSENTIALS OF VOLUMETRIC ANALYSIS.

The favor with which the first edition of this book has received has encouraged the author, Henry W. Schimpf, Ph.G., M.D., Professor of Analytical Chemistry in the Brooklyn College of Pharmacy, to revise and enlarge it. The volumetric methods are arranged in a systematic manner comprising alkalimetry, acidimetry, precipitation, analysis involving the use of silver nitrate, sodium chloride and potassium sulphocyanate. Oxidation methods are given involving the use of permanganate, dichromate and iodine. There are reduction methods also in which the analyst employs sodium thiosulphate, arsenous acid and stannous chloride. In addition are given concise descriptions of methods for assaying alkaloidal drugs, phenol, oils, sugars, formaldehyde and alcoholic liquids together with a few simple gasometric analyses such as the pharmacist may find useful. The book contains 360 pages and costs \$1.50 in cloth. The publishers are John Wiley & Sons, New York.

A COLLEGE CLASS BOOK.

The college class book gotten out by the class of 1911 of the Philadelphia College of Pharmacy is about the cleverest thing of the kind we have ever seen. The most unique and interesting feature is a collection of portraits and personal sketches of the members of the class themselves. The brief descriptions given of each student are full of humor and would do credit to *Life*. For the rest, the book contains interesting articles on the different departments of college work, the various fraternities, college clubs, athletics and the like. We are pleased to note incidentally that the cartoon of Professor Remington which appeared in the *BULLETIN OF PHARMACY* a year ago has been reproduced in the volume. The editors of the book were H. L. Lemien, J. C. Winter, and Elias Shaker. The business manager was Charles Muthig, who was assisted by A. F. Greaves and F. O. Patton. The book is handsomely printed on heavy glazed paper and is beautifully bound in flexible leather. The title is "The Graduate."

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Talcum Powders.

K. J. wants several formulas for talcum powders.

Talc when used as a toilet powder should be in a state of very fine division. Antiseptics are sometimes added in small proportion. For general use the talcum alone is the best. As a perfume, rose oil may be employed, but on account of its cost, rose geranium oil is probably more frequently used. A satisfactory proportion is $\frac{1}{2}$ drachm of the oil to a pound of the powder. In order that the perfume may be thoroughly disseminated throughout the powder, the oil should be triturated first with a small portion of it; this should then be further triturated with a larger portion, and if the quantity operated on be large, the final mixture may be effected by sifting. Many odors besides that of rose would be suitable for a toilet powder. Ylang-ylang would doubtless prove very attractive, but expensive.

The following formulas may prove useful:

BORATED TALCUM POWDER.

- | | |
|---------------------------|----------------|
| (1) Talcum..... | 14 ounces av. |
| Boric acid..... | 2 ounces av. |
| Oil of rose geranium..... | 2 fluidrachms. |

The talc and boric acid should be in the finest possible powder and should be passed through a fine sieve.

VIOLET TALC.

- | | |
|--------------------------|----------------------|
| (2) Powdered talc..... | 14 ounces. |
| Powdered orris root..... | 2 ounces. |
| Extract of cassia..... | $\frac{1}{2}$ ounce. |
| Extract of jasmine..... | $\frac{1}{4}$ ounce. |

ROSE TALC.

- | | |
|-------------------------|-----------------------|
| (3) Powdered talc..... | 5 pounds. |
| Oil of rose..... | $\frac{1}{2}$ drachm. |
| Extract of jasmine..... | 4 ounces. |

BORATED APPLE BLOSSOM.

- | | |
|--------------------------|------------------------|
| (4) Powdered talc..... | 22 pounds. |
| Magnesium carbonate..... | $2\frac{3}{4}$ pounds. |
| Powdered boric acid..... | 1 pound. |

Mix.

Carnation pink blossom (Schimmel's).....2 ounces.
Extract of trefle.....2 drachms.

To 12 drachms of this mixture add:

Neroli.....1 drachm.
Vanillin..... $\frac{1}{2}$ drachm.
Alcohol to.....3 ounces.

Sufficient for 25 pounds.

A Case of Hog Poisoning.

B. and E. submit a communication of a very unusual character: "One of our customers," they write, "mixed up a combination of equal parts of wood ashes, sulphur, salt and air-slaked lime and fed the mixture in a dry state to his hogs, allowing them to eat as much as they liked. In a few minutes sixty head were dead. Can you give any reason for this?"

Even the hair on the swine would scrape off easily after they had been lying only about an hour. It was noticed that when the living pigs climbed over the carcasses to get at the trough to feed, their feet scraped the hair off the dead animals."

A stockman informs us that he has fed a mixture of wood ashes, salt and charcoal to his pigs, allowing them to eat all they wanted, without any bad results. But the mixture mentioned in the foregoing paragraph we regard as extremely deleterious, owing to the presence of the sulphur and lime. These two substances enter into some sheep dips, and it is notorious that when the animals swallow the lime and sulphur solution they not infrequently die.

Why the hair should fall out is a little bit hard to explain. Locally the alkaline sulphides are used as depilatories, and it may be that a combination of lime and sulphur taken internally in large amounts exerts a similar effect. That, however, is pure conjecture.

Rust Stains on Fabrics.

J. S. wants a formula for removing iron rust from linen. The following preparations are suggested in the literature:

1. By adding two ounces of cream of tartar to 1 part of oxalic acid, ground fine, and kept in a dry bottle, you will find, by applying a little of the powder to rust stains while the article is wet, that the result is satisfactory. Wash out the stain in clear warm water to prevent injury to the goods.

2. Dissolve potassium binoxalate, 200 parts, in distilled water. 8800 parts; add glycerin, 1000 parts, and filter. Moisten the rust or ink spots with this solution; let the linen, etc., lie for three hours, rubbing the moistened spots frequently, and then wash out well with water.

3. Soak the stains in a solution of tin chloride, and rinse immediately with much water. The tin salt is much more reliable in removing iron rust and quicker in its action than oxalic acid, unless the stains are soaked in a solution of the latter, contained in a tin spoon, when the stains disappear in a short time.

4. Iron rust may be removed by salt mixed with a little lemon juice.

Preserving Fruit Juice.

G. G. S. asks: "What is the most harmless and surest preservative that can be used equally in preserving unfermented grape juice, pear juice and wine? Kindly give the quantity of preservative to be used in 10-gallon lots of juice."

Unfermented grape juice if properly sealed and sterilized will keep without any preservative. There is a precipitate of crude cream of tartar which leads some to age the product two years before using. Instead of the muddy purple color of the comparatively fresh product, after aging the fluid is clear. If fermentation has already set in, add salicylic acid 1/700 dissolved in alcohol. This last is contrary to the law in many States, and can be used only in preparing grape juice for home consumption. Wine should require no preservative as the alcohol present will inhibit the growth of germs. But cheap wines deficient in alcohol may require a preservative. As for pear

juice, if it tends to ferment add one-tenth of one per cent of sodium benzoate. Ten gallons of juice would require $1\frac{1}{4}$ ounces of the sodium benzoate.

Painting Heaters or Radiators.

D. D. Co. writes: "A customer of ours having polished and painted a heater times too numerous to count, and not being able to use anything so far that the heat would not peel off the first time a fire was made, appealed to us for something. We suggested aluminum enamel, black paint that plumbers use for painting smokestacks, and several other things, all to no avail. So we in turn ask you for a formula to make the polish or paint stick, or to suggest something that will do, if you possibly can."

The querist's trouble lies in the lack of proper preliminary treatment. One must first cover the iron with a heavy coat of iron filler. The Tiki brand made by the Acme White Lead Works of Detroit is very good. Thin the iron filler with turpentine so that it may be spread with a brush. After 10 or 12 hours, when the filler has dried, add bronze or a paint mixed with turpentine only (no oil). One can use a prepared aluminum or prepared bronze. This will stick every time in spite of the heat.

Canning Vegetables.

C. J. H. C.—We do not know the composition of the proprietary canning powder which you mention. The best preservative for vegetables, as far as we know, is sodium benzoate in the proportion of one-tenth of one per cent. In some States, however, food products so preserved could not be sold without violating laws. If they are properly sterilized, canned, and sealed, vegetables should require no preservative. Cannerymen are in the habit of putting a pin-hole in the cans and then subjecting them to moist heat until steam comes out of the perforations. When the containers have acquired that degree of heat, the holes are sealed with solder and sterilization is complete. But in the home, if the lid is screwed down imperfectly the vacuum created upon cooling allows air to enter by atmospheric pressure from without and germs come along with it. Hence the mold sometimes seen on the top of canned fruit or vegetables. The subject is interesting, but reasons of space forbid our saying more about it.

Removing Tattoo Marks.

E. J. G. and E. D. C.—Tattoo marks are said to be removed by the application of a paste of salicylic acid and glycerin. A compress is applied over the paste and the whole secured with sticking plaster. After about eight days, the paste is taken off, the dead skin removed, and the application of paste repeated.

Applications of cotton wadding, soaked in chloroform and kept in place by means of a bandage, are also recommended.

As for the surgical methods involving the use of strong chemicals, we hesitate to publish them. If the tattoo marks cannot be removed by such simple procedures as we have mentioned, it would be well to consult a doctor.

Two Soda Formulas.

P. O. M. writes: "Can you give me a formula for chocolate flip? Can you tell me, too, what the name of the following drink is? The formula is this: Take one ounce of the desired flavor and one ounce of No. 20 ladle of cream. Thoroughly mix and add carbonated water until a 12-ounce glass is filled."

L. W. Hartz, an expert soda dispenser in Detroit, says that a "chocolate flip" is an egg chocolate of the following formula:

Chocolate syrup	2 ounces.
Milk or half milk and cream.....	4 ounces.
Ice.....	
Egg	1

Shake and strain. Add soda water to make 10 ounces.

There is no name for the drink mentioned in the query. But if you take any flavor and parfait it with ice cream—i.e., mix it with enough to fill a 5-ounce glass—you call it a parfait. Add about 5 ounces of whipped cream, which makes it 10 ounces.

Keeping Crude Drugs Free from Insects.

A. T.—Charles J. Fuhrmann, of Washington, D. C., says that he keeps his crude drugs free from insects in this way: He puts a 1-drachm phial of chloroform in each crude drug container. It keeps the contents free from insects and requires scarcely any attention. The evaporation through a loose cork keeps the insects away.

Murphy Williams, of Corsicana, Texas, has had good results with this scheme: Once a month regularly he pours a few drops of chloroform into each container of crude drugs. This procedure is inexpensive and kills the insects without injuring the goods. Mr. Williams makes a note on his calendar and does the chloroforming regularly on the 15th of each month.

Yellow Capping Fluid.

F. G. R.—We do not know the composition of the particular capping fluid for bottles which you mention. But the following formula should be satisfactory:

Dip the heads of bottles suitably corked, and, if desirable, provided with a tag or label pasted over the cork, into a fluid prepared with these ingredients.

Colophonium resin	20.0 parts.
Ether	40.0 parts.
Collodion	50.0 parts.
Oil soluble, yellow.....	sufficient.

The liquid varnish dries rapidly and leaves a beautiful transparent coating if made without the dye. With the addition of the dye, a yellow color should be imparted to the cap.

A Hair Tonic.

J. W. desires to know what product is called for in the first item of the following prescription:

Cantharis	4 fluidrachms.
Glycerin	1 fluidounce.
Bay rum	4 fluidounces.
Distilled water	2 fluidounces.

Sig.: Apply to the scalp at night.

The tincture of cantharides is presumably indicated. Hair tonics and preparations for the treatment of alopecia commonly contain this ingredient.

BULLETIN OF PHARMACY

THE MONTH'S HISTORY

MORE FAMILY QUARRELS.

The bad blood between Mr. Goddard and the Chicago Wholesale Drug Co. was in evidence again at the Niagara Falls convention of the N. A. R. D., and we have since then been treated to a continuance of the quarrel in print. Immediately following the convention, an article appeared in *The Voice of the Retail Druggist* bitterly criticizing "Zuber, White and a handful of the Chicago delegation to Niagara" for endeavoring to "make a great fuss because the A. D. S. management ran a special train from Chicago for the accommodation of members desiring to attend the A. D. S. mid-year meeting." This train was necessary, asserted *The Voice*, in order that the Chicago A. D. S. members might be brought to the meeting of their own organization in due time.

A hot reply to this editorial in *The Voice* was immediately printed in the *C. R. D. A. News*. *The News* story took up over three pages of space, and was chiefly a vigorous assault upon Mr. Goddard himself. It declared that there really was no A. D. S. meeting at Niagara; that there was nothing but a lecture given by Elbert Hubbard under the auspices of the A. D. S.; that in endeavoring to bring a special train to Niagara from Chicago Mr. Goddard was using his grievance against the Chicago Wholesale Drug Co. as a cloak to attack and disrupt the C. R. D. A.; that he wanted the Chicago votes for his own purposes; and that his real motive was "to elect a president and executive board of the N. A. R. D. of his own making."

Since this counter-attack in the *C. R. D. A. News* was published, *N. A. R. D. Notes* has added a little fuel to the flame by supporting the C. R. D. A. in its defense of Mr. Zuber. It declares that the reflections cast upon Mr. Zuber by *The Voice of the Retail Druggist* were entirely unwarranted, and that he has the entire respect not only of the C. R. D. A., but also of the official family of the N. A. R. D. Later yet we observe that President Hoelzer of the C. R. D. A., at the recent quarterly meeting, has devoted nearly all his presidential address to the situation and has handled Mr. Goddard and the A. D. S. rather roughly and without gloves.

While reporting upon these matters concerning the A. D. S., we are reminded incidentally that early last month another article appeared in *N. A. R. D. Notes* indicating that from 150 to 300 employees of the company were out on a strike. W. J. Finn, whom the press reports had called the "general manager," was said to be in sympathy with the strikers and to have resigned. W. Burnett, who was called the "merchandise manager," had apparently quit also. This trouble has doubtless been settled before now, although we have seen no later reports either in the *Notes* or the newspapers.

The developments of the last six or seven weeks would seem to indicate that Dr. H. W. Wiley has been helped rather than hurt by the recent Wiley-Rusby entanglement. Shortly after President Taft exonerated Dr. Wiley, Solicitor George P. McCabe resigned from the Board of Food and Drug Inspection. It was he who had apparently been mainly responsible for bringing the charges against Dr. Wiley, and since the President dismissed the charges, there was nothing manifestly for McCabe to do but to withdraw, particularly since there had been a good deal of bad blood between the two men, and it had been shown in the congressional investigation that they could not work together harmoniously and with satisfactory results in the administration of the food and drugs act.

The man selected to succeed McCabe on the Board of Food and Drug Inspection was Dr. Doolittle, who has for some time had charge of the government drug laboratory in New York. It was understood that Doolittle was Wiley's choice and that the two men would work together.

Dr. Dunlap, the third member of the board, who was apparently more in sympathy with McCabe than with Wiley, has left Washington on a leave of absence. But in any event, even if he returns to his work on the board, he will now be in the minority. Meanwhile, however, Solicitor McCabe, although no longer a member of the Board of Food and Drug Inspection, is still the solicitor of the Department of Agriculture, and in this capacity he is vested with the power under a special law of deciding whether a given case under the food and drugs act shall or shall not be reported to the Department of Justice for prosecution. To this extent it would appear that he still serves as a check upon Dr. Wiley, although no one seems to know just how much power he will continue to be given by Secretary Wilson. One day the newspapers report that the secretary still "has every confidence in the solicitor, and intends by all means to retain him with authority undiminished." The next day the story is that McCabe will no longer be permitted to impose any restraints upon Dr. Wiley, and that from now on Wiley will be "it." So there you are!

It would seem, however, that the present settlement of the interdepartmental differences

is merely temporary. There is a general conviction that when the President gets back to Washington, and particularly after the Congressional Committee has rendered its report in December, some improved system of administering the food and drugs act will be worked out—a system, of course, in which Dr. Wiley will retain a prominent if not the leading part.

* * *

WITH THE JOBBERS.

Much of value and importance developed at the meeting of the National Wholesale Druggists' Association in New York City during October, but unfortunately our space prevents us from going very much into detail. One of the most interesting discussions was that caused by the statement of the Committee on Credits and Collections that there were far too many jobbing salesmen in the country, and that the number should be cut down by 25 to 50 per cent. Everybody was agreed that the orders were getting smaller and smaller, and that they were being parceled out among a larger and ever larger number of travelers, but no one seemed to have much faith that there was an effective remedy for the situation. A committee, however, will study the problem and report next year.

One of the ablest reports was that submitted by the Committee on Legislation. Among other things it was declared that both the Mann and the Foster congressional anti-narcotic bills were open to serious objections, and that a compromise measure should be drafted by the N. W. D. A. and its introduction sought. It was voted to draft such a bill. The position was also taken in the report of this committee that the so-called "variation clause" of the food and drugs act was of great importance, should by all means be retained, and that, moreover, there ought to be no amendments to the food and drugs act until there had been further judicial interpretations to indicate just what the present law means. A resolution to this effect was adopted.

The Committee on Proprietary Goods expressed in strong terms its disapproval of the "prescription proprietary." It also took another fall out of the coöperative buying movement, but expressed the opinion that this movement had not progressed during the past year, and that if anything it had lost ground. A resolution was subsequently adopted calling

upon manufacturers not to furnish their goods to coöperative concerns, the argument being that the manufacturer must look to the regular jobber for his main support and should not use him as a mere convenience.

Of particular interest to retailers was the presence of Prof. Joseph P. Remington at the convention, and his speech on progress in pharmacopœial work. Professor Remington declared that he would be pleased to tell when the next U. S. P. would be published if he knew himself. One of the interesting bits of information in his address was the statement that Dr. Wiley and Dr. Kebler, now that some changes had been made in the Department of Agriculture as the result of the recent upheaval, would probably be able to resume their pharmacopœial work.

The new president of the N. W. D. A., Theodore F. Meyer, is made the subject of mention elsewhere in the present issue of the BULLETIN. J. E. Toms was of course re-elected to the secretaryship, and Samuel E. Strong to the treasurership. Charles Gibson was again made chairman of the Board of Control, and William P. Richey chairman of the Committee on Proprietary Goods. Frank E. Holliday remains the "general representative" of the N. W. D. A.

Next year's meeting will be held in Milwaukee during October.

* * *

OUR GERMAN-AMERICAN CONFRERES.

New York City boasts of a pharmaceutical association which, despite its remarkable history, has perhaps been little known and appreciated elsewhere throughout the country. We refer to the German Apothecaries' Society—the *Deutsche Apotheker Verein*. The Verein celebrated the sixtieth anniversary of its foundation on the evening of September 28, when a Fest-kommers was held, and as well on October 12, when there was a banquet and ball attended by the ladies. A historical sketch of the society, prepared for one of these occasions by Dr. W. C. Alpers, and written in that eloquent and inspiring vein for which he is well known, was contributed to the October issue of the *Druggists Circular*.

From this sketch we learn that the Verein is the oldest pharmaceutical society in the United States. It even antedates the venerable A. Ph. A. by one year. Following the

failure of the Republican Revolution in 1848 in Germany, hundreds of educated Germans flocked to this country, and in 1851 twenty-five German apothecaries in New York City formed a society primarily for social and fraternal purposes. The membership and ideals of the organization rapidly developed, however, until now Dr. Alpers is able to say, looking back over the ensuing 60 years, that there has been no general movement in pharmaceutical matters in which the Verein had not taken an active part, while in many a cause it had been the acknowledged pioneer.

In 1852 it prepared a formulary manual which ultimately evolved into the National Formulary. In 1859, realizing that pharmaceutical education practically had no existence in New York, it appointed a committee which instructed and examined young men in various branches of study. In 1871 and '72 it led the fight against a vicious pharmacy bill and secured the enactment of a law satisfactory to the pharmaceutical interests—the first pharmacy law placed on the statute book of the State. In 1874 it prepared a comparative compendium of the preparations of German and United States Pharmacopœias, and thus did pioneer work in the direction of an international pharmacopœia. In 1890 or thereabouts it instituted an agency for the legal protection of its members against blackmail. Later on it caused the establishment of a buying club, which ultimately resulted in the formation of the New York Consolidated Drug Co. These and other achievements have been registered by the Verein, and the society has an organ of its own in the *Deutsche Amerikanische Apotheker Zeitung*, the management of which rests in the capable hands of Hugo Kantrowitz.

Hoch der Deutsche Apotheker Verein!

* * *

THE N. A. R. D. AND SUNDAY CLOSING.

Mrs. Emma Gary Wallace, of the *Era* staff, addressing the N. A. R. D. convention at Niagara Falls, made an appeal for Sunday closing. Mrs. Wallace contended that druggists deserve to enjoy the companionship of their wives and families at least one day in the week—a sentiment which later found indorsement in the speech of Charles Huhn. William E. Lee of Philadelphia thereupon remarked that he closed five hours from 1 to 6 on Sun-

days, and that many people had commended him for it. Moreover, he expressed a belief that the few who keep open in the city were not making a fortune by it. B. E. Pritchard of Pittsburg maintained that druggists don't want to close on Sundays. He remarked: "I venture to say a rising vote would not get a single affirmative." Dr. W. C. Anderson, who was then in the chair, hesitated to put the question to a vote because as he jokingly said: "I don't want to show you up."

While one can always advance a strong, eloquent argument for Sunday closing it does seem that right down in the bottom of their hearts the majority of druggists are against it. Those who do not oppose Sunday closing on principle, question it on other grounds. They doubt its feasibility. Mr. Pritchard argued, however, that a store well installed, with its trade firmly established, can be closed whenever the proprietor feels like it, and he cited cases to back up that assertion. He went on to say that the largest store in Pittsburg starts at 8, closes at 6, and is shut up on Sundays. Other druggists testified to observing shorter hours on Sundays to the benefit of their business.

C. P. Gladding of Hartford, Connecticut, explained how the public can be educated to understand shorter hours. His store is closed on Sundays from 1 to 6, and on holidays also. Mr. Gladding expressed the wish that the practice of Sunday closing were universal.

A resolution was finally adopted in which the Association recommended that all druggists should, so far as practicable, observe Sunday, or such portion thereof as is possible, as a period of rest.

* * *

**SILVER SERVICE
FOR
CHAS. F. MANN.**

In our report last month of the Niagara Falls meeting of the N. A. R. D. we dwelled at some length upon the voluntary retirement of Charles F. Mann from the chairmanship of the Executive Committee, and upon the very appreciative action of the membership in deciding to present a handsome gift to Mr. and Mrs. Mann. What might be called a presentation-speech-in-advance was admirably made at the convention by W. S. Elkin, Jr., but the gift itself could not be purchased during convention week with the limited facilities of Niagara Falls. A committee was therefore appointed to make the purchase in

New York subsequently, and we find from *N. A. R. D. Notes* that since then a silver service has been sent to and received by Mr. and Mrs. Mann.

In a letter contributed to *The Notes*, Mr. Mann feelingly expresses his appreciation, but it was thoroughly characteristic of the modesty of the man that at Niagara Falls he expressed the wish that he might have given up his place on the Executive Committee without any publicity. For eight or ten years Mr. Mann has spent himself with great devotion on the work of the N. A. R. D., as treasurer, as president, as chairman of the Executive Committee, and in other capacities as well, and few men know what sacrifices he has really made in behalf of the cause. Many a time he has burned the midnight oil when considerations of health, not to mention considerations of family, bade him take rest and recreation. He has worked faithfully and well, and it is exceedingly gratifying that the organization knows it and has so whole-heartedly given testimony of its appreciation. * * *

**THE CULTIVATION
OF
HYDRASTIS.**

An article appeared in this department last month in which the increasing scarcity of golden-seal was dwelled upon, and in which it was intimated that the domestic cultivation and growth of the drug was becoming exceedingly profitable. Since the article appeared we have received a number of letters from druggists who are seriously thinking of undertaking the cultivation of golden-seal, and who have asked us where they could secure reliable information on the subject. We have said to them personally, and we may now say publicly to others who may be equally interested, that the Bureau of Plant Industry of the Department of Agriculture, Washington, D. C., will furnish any inquirer with a booklet on the artificial cultivation of golden-seal. The government authorities are doing all they can to foster the domestic growing of this drug in view of the great scarcity of the native plant. On page 325 of the *BULLETIN* for August, 1905, an illustrated article on the cultivation of golden-seal was printed from the pen of Mr. Northam Warren. This paper will be read with pleasure by those who are interested in the subject, but inasmuch as it was written six years or more ago, later and more up-to-date information may be found in the government publications.

**TRADE CONDITIONS
IN CANADA.**

An interesting report on trade conditions in Canada was submitted by the Committee on Commercial Relations at the recent annual meeting of the Canadian Pharmaceutical Association, the chairman of which was R. S. Knowles of Vancouver. A series of questions had been asked of the members of the committee scattered over the Dominion, and from the answers it appeared that, for instance, business was better than a year ago on the average, although expenses had increased in as great a ratio as the profits, if not indeed in a greater degree. Salaries paid to clerks had gradually risen, and rents in some instances had advanced.

Cutting was reported as still being in existence, although the Atlantic and Pacific coasts were fairly free of it, as were Alberta, Saskatchewan, Quebec and the maritime provinces. Jobbing prices were said to have gradually risen, with practically no compensatory reductions. The chain store has grown in the Middle West a good deal, but it has helped those outside by making them lively boosters of Canadian goods and of their own preparations. Prescription prices have increased, and the committee was of the opinion that they could be increased still further if the C. Ph. A. price mark were used on all prescription copies. Finally, it was declared that no wholesalers were starting or backing cut-rate stores.

* * *

**WHY TAKE A
CHANCE?**

Several times during the last year we have pointed out how careless many druggists were in failing to secure adequate fire protection, and we have given specific instances where the owners of drug stores have suffered heavy losses from fire for this reason. Recently we find that there was a disastrous fire in a Southern town. Among others, three drug firms were entirely burned out. Were they fully protected by insurance? Alas, no! One of them had a stock of \$9000 and carried \$7500 of insurance. The second had a stock of \$7900 and carried insurance of \$4950. The third had a stock of \$3500 and carried insurance of \$2900. Doubtless all three are realizing now that they have had to pocket more or less substantial losses through sheer carelessness, but it is just a little late to wake up to this fact. Why take a chance?

**THE "INTERSTATE"
BOARDS.**

The Interstate Association of Boards of Pharmacy is one of the two or three branch or sectional bodies operating under the aegis of the National Association of Boards of Pharmacy. It covers the States of Ohio, Michigan, Indiana, Kentucky, Illinois, Minnesota and Wisconsin. The purpose of the body, as with the others of the same character, is to bring about uniform conditions and requirements for registration in the different States. The members of the Interstate Association recently met in Madison, Wisconsin, as the guests of the Wisconsin Board. Among other things they were taken through the grounds of the State University and were given a banquet. Burton Cassaday of the Indiana Board was elected president, Robin H. White of the Kentucky Board vice-president, and O. J. S. Boberg of the Wisconsin Board secretary.

* * *

THE CLERKS.

The organization of clerks known as the National Association of Pharmacologists is keeping up its activities. At a recent monthly meeting of the executive board it was reported with pleasure that three of the State boards of pharmacy now had clerks among their members. In other States the governors have given the N. A. P. the assurance that they will bear the request of the Association in mind in making future appointments. In the meantime the N. A. P. has adopted a resolution in which it is declared that many of the drug departments in State institutions are under the conduct of unregistered and incompetent help; that the State itself is thus violating its own laws; and that the governor of every State be called upon to correct the situation.

* * *

The Jacobs Pharmacy Company, of Atlanta, Ga., has purchased the three stores of T. H. Brannen, located in that city, for a consideration reported to be between \$50,000 and \$60,000. This move gives the Jacobs Company ten stores. Verily, the chain-store movement seems to be growing!

* * *

Geo. H. Hitchcock, Ph.G., president of the New York branch of the A.Ph.A., and a well-known pharmacist of that city, died suddenly last month of heart failure.

EDITORIAL

PHARMACISTS AND "606."

Some months ago, when we were able to secure from H. A. B. Dunning a couple of exceedingly valuable contributions* detailing with some care the best methods of dispensing solutions of Salvarsan, otherwise known as "606," we expressed ourselves editorially as believing that this remarkable chemical would doubtless be followed by others of a somewhat similar nature, and that pharmacists would thus be provided with an opportunity to exhibit their scientific skill and to take advantage of their scientific training.

It cannot be said that any great number of pharmacists have seized upon the opportunity to make capital of the situation among the physicians in their neighborhood. And yet considerable interest has been exhibited in the subject. Thus we have found that several papers have been contributed during the past summer to the State pharmaceutical associations. We recall one, for instance, which was read before the New Jersey Pharmaceutical Association by George M. Beringer, Jr., while another was presented to the Missouri Association by W. K. Ilhardt.

Following the reading of Mr. Ilhardt's paper there was an interesting discussion which is fully reported in the volume of proceedings. It was made apparent, as we have already declared, that the preparation of Salvarsan solutions calls for a good deal more pharmaceutical and chemical skill than the physician can ordinarily exhibit, and that the pharmacist can make a ten-strike if he goes after the business in earnest. Mr. Ilhardt declared that some of the physicians in his acquaintance at first tried to prepare Salvarsan solutions themselves, thinking that the work was easy, and not liking to pay the pharmacist for his trouble. The results, however, were not favorable. One doctor, for instance, got his solutions too alkaline and his patients were most unfavorably affected.

Mr. Ilhardt said that he had made the solution for physicians about forty times. The

medical men were delighted with his cooperation, and in some instances had gone so far as to mention him in articles on Salvarsan contributed to the medical press. In reply to an inquiry made by Professor Hemm, Mr. Ilhardt explained that he had started out by charging \$10 for the preparation of these solutions. After learning the time involved, the nature of the difficulties, and the equipment needed, he had raised his price. He had found this particularly necessary because considerable experimentation was required at the outset. The work was one of great importance, the lives of men were at stake, and the utmost care and precaution had to be exercised. Some physicians had complained about the price, while others, especially those who had tried to do the work themselves, thought the figure very reasonable. Mr. Ilhardt is now charging from twelve to fifteen dollars for making the solution, and in one case he sent out a bill for \$25. While on this question of price it may be said that A. H. Koch declared that he usually charged \$10 where the patient paid for the Salvarsan, making the total bill \$13.50.

Incidentally one or two interesting points concerning the product were brought out during the discussion. Mr. Ilhardt dwelled on the necessity of so filtering the alkaline solution that it may be perfectly clear. Leo Suppan asserted that the filtration must be carried on as rapidly as possible, and for that reason he thought cotton was generally superior to paper. He asked Mr. Ilhardt whether he had ever tried any of the hardened filtration papers which could be gotten in various thicknesses. Mr. Ilhardt replied that he had not—he had tried papers of various grades, but had been unable to remove the specks and fibers with the paper employed. Upon this point Mr. Koch explained that he used rapid filtration paper. He filters the solution, and when it comes from the filter he has never had occasion to run it through a second time.

Something having been said about the untoward results following the administration of Salvarsan, D. V. Whitney gave it as his understanding of the subject that the drug should never be employed when the spirilla of syphilis were absent. The first and primary thing to be considered, he asserted, was the presence or absence of spirilla. He spoke of one case where the patient himself was convinced that he was the victim of syphilis, and where ulcers

*Mr. Dunning's articles appeared on page 14 of the BULLETIN for January, 1911, and page 79 of the issue for February, 1911.

had formed. The attending physician, however, failed to find the spirilla, nor did he go farther and employ the Wassermann test to determine the actual presence or absence of the disease. He injected the Salvarsan solution, with very bad results.

Reverting now to the question of filtration, we may say that we have interviewed Leonard A. Seltzer of this city, who has been making a specialty of dispensing Salvarsan solutions. Mr. Seltzer tells us that in filtering the alkaline solution he uses a filter paper which has been sterilized by live steam. He prefers this to cotton. It is understood that this whole question of filtration refers to the alkaline solution. The neutral suspension is of course not filtered.

As to price, we find that a considerable disparity exists. One of the Detroit pharmacists has been charging the physician \$5, but when the doctor sends the patient direct to the store a price of \$10 is made. We understand, although we may be wrong about it, that some of the eastern pharmacists are getting only \$5, and we have been told that one man is even charging as little as \$3.50. This is unfortunate. If a pharmacist doesn't respect himself and his skill, he can scarcely expect any one else to respect him.

A BOOK OF ANSWERS TO BOARD-OF-PHARMACY QUESTIONS.

E. G. Swift, publisher of the BULLETIN OF PHARMACY, has just brought out a book entitled "Board Questions Answered." The department conducted under this title in the BULLETIN for a number of years will be recalled by readers of this journal. Thousands of students and even pharmacists read the department every month with keen zest and interest, and they doubtless will be glad to know that a book on the subject has now been published and handsomely bound in cloth.*

Complete sets of examination papers used by different boards of pharmacy are given, and "answers are compiled for the benefit of graduates of the pharmacy colleges and unregistered men generally who desire to review their knowledge preparatory to taking the board examination." The work of compilation was done by John Helfman, A.B., B.S.Pharm., who was graduated from the four-year course in pharmacy of the University of Michigan,

who spent five years altogether in the University, and who has now for several years been the assistant editor of the BULLETIN. An introduction to the volume is contributed by Harry B. Mason, editor of a series of practical books of which this is the third.

It is made clear in the introduction to the volume that the book is not intended to provide a crammer's course in pharmacy. Those who are "seeking a pharmaceutical education on the quick-lunch plan" are likely to be disappointed. On the contrary, the book is designed for the use of graduates in pharmacy or home students who desire to refresh their memories in preparation for the board ordeal. And there is no doubt that every candidate needs a review course of some sort. Even the recent graduate is likely to be "plucked" when he takes the board examination. In Pennsylvania, for instance, no man can be examined for full registration as a proprietor unless he is a college graduate, and yet we find a large percentage of failures. Why is this? Is it because the colleges have failed to do their duty and the boards have found them out?

We do not think so. In the great majority of cases the reason is much more likely to be this, that on the one hand the boys are not familiar with the particular kind of questions asked by the board, while on the other they have forgotten a lot of detailed facts which they understood perfectly well when originally studied, but which have slipped their halters and escaped the memory. The simple fact is that every candidate, no matter how thorough his education may have been, finds it necessary to make specific preparation for the board examination. So well is this generally realized that in at least one of the leading university schools of pharmacy—a school having high ideals of scholarship—a special course is given in pharmacy-board questions and answers at the end of the last year's curriculum.

The present book is evidently intended to provide some such course. It will enable the home student or the college graduate to refresh his memory on the one hand, and on the other it will make him familiar with the character of questions asked by the boards of pharmacy in the different States.

Every one of the several examination papers is complete. The questions are not selected—the easy ones given and the hard ones omitted. Not even catch questions have been dodged. Every one of the examination papers is repro-

*The price is \$1.50, and the publisher is E. G. Swift, P. O. Box 484, Detroit, Mich.

duced exactly as it was originally used by the board in order that the student may get an adequate and thorough idea of just what is comprised in the examination papers of that particular board.

THE N. A. R. D. WANTS A PRICE-PROTECTIVE PLAN THAT WILL DO THE BUSINESS.

The N. A. R. D. is on the hunt for a valid and effective price-protective plan. Price protection seemed to be the chief issue at the recent convention in Niagara Falls. After the discussion of several plans it was finally voted to put the whole thing up to the Executive Committee, and to charge that committee with the duty of framing a valid plan and of seeking its general adoption. The Chicago delegation came to Niagara Falls heartily in favor of a new form of the old coupon plan suggested by one of its members, John J. Boehm, and succeeded in having it referred to the Executive Committee with power to act. The Executive Committee, under the chairmanship of Charles H. Huhn, is now showing a determination to follow out the instructions of the convention. In order to go at the proposition with all the wisdom available, it cordially invites the suggestions of every student of the problem. At its meeting to be held during December in Chicago, the committee will doubtless make either preliminary or final plans for the adoption of some definite method of price protection.

In the meantime we have asked Frank H. Freericks to contribute an article on the subject to our pages. His analysis of the situation will be found elsewhere in the present issue, and will prove to be full of interest and suggestion. Mr. Freericks has the great advantage of blending pharmaceutical sympathies and experience on the one hand, with a legal training on the other, and what we particularly requested of him was that he give his opinion of the probable legality of the various price-protection plans now under discussion, and the relation they bear to the recent decisions of the United States Supreme Court. It will be gathered from his contribution that while he deems the present Miles-Freeman plan to be legally sound, he questions the validity of the coupon plan. If manufacturers and jobbers, however, "shy" at the Miles-Freeman plan because of the practical difficulties of

carrying it out, he suggests that it be combined with the coupon plan in such manner as to secure the advantages of both methods. In this way he thinks the legality of the "agency assignment" scheme will be retained, while the practical simplicity of the coupon plan will do away with a good deal of bookkeeping and inconvenience of one kind and another.

Mr. Freericks's suggestion is certainly worth thinking about. Inasmuch as Judge Errant, the official attorney of the N. A. R. D., though fortunately improving in health, will not be back in harness for some time, it seems wise that other legal talent in the drug trade should be applied to this problem before a solution is finally attempted. Men like James H. Beal and Frank H. Freericks will be exceedingly useful in the emergency, for the N. A. R. D. is facing a legal even more than a commercial situation, and the opinions of laymen are of very little value.

PRIMARILY ABOUT SHOW-CARDS.

Readers of the BULLETIN OF PHARMACY, thank heaven, have the true coöperative spirit! If one of them desires suggestions or help of any kind, others are not wanting to render their assistance in brotherly fashion. Two or three months ago a subscriber complained that we had had very little in the BULLETIN on the subject of show-cards. We at once printed his complaint and asked our readers what they had to offer for the benefit of the BULLETIN brotherhood. The result is partially seen in the present issue of the journal. In the "Illustrated Section" is a full-page engraving showing a number of cards gotten up by A. R. Eberle of Watertown, Wis. Among the "Contributed Articles" is a paper by Edwin P. Creutz of Wausa, Neb., accompanied by a couple of illustrations. In the department of "Business Hints" are a number of legends for show-cards furnished by G. R. Thomason of Stockton, Kansas. These three contributions will do as starters. We have received several others to which we are not able to give space this month, but which will appear from time to time in the BULLETIN. Meanwhile we shall be glad to hear from other readers who have had practical experience along this line and who have either specimens or ideas to contribute.

Let us help one another!

THE HALL OF FAME

THEODORE F. MEYER ELECTED PRESIDENT OF THE JOBBERS.

The new president of the National Wholesale Druggists' Association, elected to that office at the meeting in New York last month, is one of the most interesting personalities of

THEODORE F. MEYER.

the country. On the one hand a royal entertainer, unstinted in his generosity toward friends, and of great charm and warmth of manner, he is on the other hand a man of hungry ambition and remarkable aggressiveness. To his business associates he has

often remarked that "the world is the market for Meyer Brothers." This house is said to have the largest business of any jobbing house in the United States—and consequently in the world. The number of employees has been asserted to be considerably in excess of 700, and the annual volume of business is generally supposed to be in the neighborhood of \$8,000,000. A trip through this great St. Louis establishment shows the marvelous variety of the modern jobber's business, and indicates that the wholesaler, like the retailer, has found it necessary to add side-line after side-line if he would succeed at the game. Two or three decades ago Mr. Meyer's father served a term as president of the N. W. D. A., and now that the son is called to the same position it would seem that the Meyer dynasty promises to achieve a permanent place in the annals of the drug trade of the country.

MR. CARRAGAN'S ANNIVERSARY DINNER.

One of the most lovable and popular men that the drug trade of this country has ever produced is Sydney H. Carragan, Assistant Manager of the New York branch of Parke, Davis & Co. It would be an exaggeration to claim that "Syd" has been with P., D. & Co. since before the flood. All he owns up to is twenty-five years. His silver anniversary he celebrated in fitting style on September 25 by giving to fifty-eight of his associates a unique beefsteak dinner at Reisenweber's. It was a gale of fun from start to finish. The "boys" in the house and some of those on the

A flash-light picture of the Carragan diners.

road presented the host with a magnificent watch. The visiting *confrères* gave a chain, a gold pencil, and an umbrella. The guests vied with one another in doing honor to the host and in expressing the warm affection cherished by a multitude of friends for Syd Carragan.

A flash-light picture of the diners is shown on page 449. The fantastic paper caps, the large butcher aprons, and the beer-keg stools were the fanciful paraphernalia of the strange feast. The beefsteak was served on squares of bread. The chops were removed from the huge platters with the aid of Nature's forks. Plates and knives were scornfully rejected.

The young, rich voices of Parke, Davis & Co.'s New York quartette provided excellent music. Mr. Lester Carragan played the accompaniments. In addition, three young "gentlemen of color" made things very lively with their singing versions of Alexander's ragtime band and other popular airs.

DAVID IRVING COHEN OF JERSEY CITY.

David Irving Cohen, Ph.G., is a young druggist who has been very successful as president of the Young Men's Hebrew Association of

DAVID I. COHEN.

Jersey City, a body of 200 members. In this capacity he has put his business ability to good use. When he accepted the presidency, the organization was very much in debt. But he

has since lifted it out of the mire into a position of good standing. Born in New York in 1888, Mr. Cohen was graduated from the public schools of that city, attended high school, later the College of the City of New York, and finally took a degree from the College of Pharmacy of Columbia University. For a considerable time he managed the Gold Pharmacy, one of the largest drug stores in Jersey City. At present he is prescription manager of one of the big Hegeman stores in New York.

THE PRESIDENT OF THE OHIO ASSOCIATION.

In making Azor Thurston, of Grand Rapids, its president this year, the Ohio State Pharmaceutical Association selected a man

AZOR THURSTON.

who is of much credit to his calling. A graduate of the School of Pharmacy of the University of Michigan, he has always been true to the scientific and professional precepts of the late Dr. Prescott, and he has made analytical and allied work pay him handsomely. Moreover, he has for several years been State Chemist under the Dairy and Food Commission, and during all this time he has of course continued his drug business. Mr. Thurston is quite as successful in commercial as in sci-

entific directions, however, and is the largest stockholder and the cashier of the Grand Rapids Banking Company, as well as the secretary of the Crescent Telephone Co. and a director in the Toledo Life Insurance Co.

A PITTSBURG DRUGGIST.

In the BULLETIN for April of this year we had an excellent symposium comprising a number of papers from practical druggists on the subject of window dressing. One of the contributions was by A. Armor of Pittsburg, and we may say that during the last few years a number of practical suggestions of this char-

ALPHEUS ARMOR.

acter have come to us from the same source. We now have pleasure in presenting a portrait of Mr. Armor himself in order that our readers may form his acquaintance.

HE SEEMS TO BE IN DEMAND.

Druggists who attend the annual meetings of the N. A. R. D. know about W. E. Bingham of Tuscaloosa, Ala. He is always on hand as a representative of his State, and quite frequently he has served as one of the two assistant secretaries appointed every year at the N. A. R. D. conventions. At home Mr.

Bingham is a member of the State Board of Pharmacy, and he seems to have a life cinch on the secretaryship of the State Pharmaceu-

W. E. BINGHAM.

tical Association. Not only this, but Mr. Bingham has been more or less active in local politics, and he is now serving as president of the City Council. More than that, we find that he is Grand High Priest of the Grand Chapter of Royal Arch Masons of the State of Alabama—an honor that any man might covet. Is Mr. Bingham appreciated? The question seems to answer itself pretty eloquently.

Indifferent Affinities.—

Prof. R. Pictet, who likes to experiment at extreme temperatures, says that sulphuric acid and caustic soda will not unite at temperatures below -85° C. Sulphuric acid and 23-per-cent ammonia commenced to react at about -68° C., and the temperature suddenly rose to above $+100^{\circ}$ C. Marble dust began to react slowly with sulphuric acid at -52° C., and was very active at -15° C. Dilute sulphuric acid refused to pay any attention to barium chloride at temperatures below -70° C., and 33-per-cent hydrochloric acid absolutely ignored silver nitrate below -109° C. Blue litmus remained blue in the presence of sulphuric acid at -140° C., and only blushed at -105° C. It behaved the same way with strong hydrochloric acid. Solutions of caustic soda and phenolphthalein, in absolute alcohol, remained colorless below -100° C. when mixed. Sodium refused to dissolve in 84-per-cent alcohol below -48° C., and potassium was indifferent below -68° C. But when they began to unite they warmed to it rapidly.

This American store in Tokio, Japan, was so unique for that city and country that the newspapers gave it a half-column notice on the front pages when it was opened a few months ago. It is called "The Hospital Pharmacy."

It will be seen from this view of the interior that the store is modeled after our American establishments, and this was the feature of it which was noticed in the newspaper articles. The store is even provided with an American soda fountain!

Here we have Manager Jasper A. Fenner and his chief assistant, Mr. Muri, at work in the prescription room. Mr. Fenner is an alumnus of the School of Pharmacy of the University of Michigan, class of 1906.

Mr. Fenner has succeeded in working up a considerable export trade among the physicians of Manchuria, China, Siam, and the Philippine Islands, supplying them with surgical instruments and hospital supplies.

Price **\$1.00** a bottle.

Five coppers will buy

a "BEN ALI CIGAR."

Some Home-made Show-cards.

A. R. Eberle, Watertown, Wis., sends us these six placards, and remarks: "There is nothing unusual about these cards, but they will perhaps illustrate what can be done by any one with a little practice and with an ordinary sign-maker and a ruling pen. The illustrations on the cards were cut from posters and discarded magazines. We suspend these signs around the store, and find them to be good silent salesmen of an effective sort." Mr. Eberle's cards are 14 by 22 inches in size. The cardboard is white, the ink black, and the borders red. In an article contributed to page 376 of the BULLETIN OF PHARMACY for September, 1909, Mr. Eberle described in detail his method of making show-cards.

WANTED: A VALID PRICE-PROTECTION PLAN.

What Will Stand the Test Now that the Supreme Court has Spoken?—A Consideration of the Freeman, the Miles, and the Coupon Plans—A Final Suggestion—The N. A. R. D. to Adopt Something in the Near Future.

By FRANK H. FREERICKS.

In the drug trade price protection is without doubt as important and as needful to-day as it was in 1898 when its necessity brought into life the National Association of Retail Drug-gists. The insistent demand for it at the recent Niagara Falls convention of the N. A. R. D. emphasized this to be the truth, and the response given to this demand by the officers and the executive committee fully proves that they are driven to the situation and mean to do their best.

In 1898 and for years thereafter, price protection meant that a plan should be evolved which would be both practical and effective. To-day price protection means all that and more, for we know now that it must not only be practical and effective, but it must also be legal. The all-important present-day need of the retail drug trade is an effective, practical and *legal* plan of price protection. The last convention of the N. A. R. D. imposed upon its executive committee the duty of finding such a plan and of seeking its adoption. Truly no small task, and yet let us hope not an impossible one.

In responding to a request from the Editor of the BULLETIN OF PHARMACY for a discussion of this problem, the writer's mind turns first to the legal limitations which concern it. To understand and apply these limitations of the law is undoubtedly of first importance. The question is, under the law, what can and what cannot be done? To decide this we have not far to look, for the Supreme Court of the United States, in its late decisions in the Standard Oil and Tobacco Trust cases, and in the case of the Dr. Miles Medical Company vs. Parks & Sons Co., has spoken in no uncertain terms, and has laid the law down right at our doors.

THE SUPREME COURT DECISIONS.

Without entering at this time into a detailed analysis of the Supreme Court decisions in the above cases, we accept as settled:

1st. That no effective and enforceable plan of price schedules is legal.

2d. That no contract plan, restricting prices under which the manufacturer *sells* his goods to the trade, is legal.

3d. That a contract plan, restricting prices, under which the manufacturer effectively retains the ownership in his goods until they reach the consumer, is legal. This last proposition involves a true agency agreement, under which both jobber and retailer are in a true sense agents; they do not own the goods of the manufacturer, but they hold them on consignment, and they thus act strictly in the capacity of agents for the manufacturer in placing his goods into the hands of the consumer.

In support of the last proposition it may not be amiss to say that it has been established in the law since the early days. The maxim, "*Qui facit per alium, facit per se*," is as old as the English Law itself; and since it cannot be questioned that a manufacturer can sell his goods at such prices as please him, and since by acting through another he merely acts for himself, he thus himself places his goods in the hands of the consumer, and himself charges the price to the consumer when he does this through a properly constituted agent. The Supreme Court in its majority opinion plainly draws the distinction, and by inference upholds the law of agency, as here defined, by constantly and repeatedly pointing out that under its form of contract, which was then before the Court, the Dr. Miles Company did not merely attempt to control the price at which its agents might sell its products, but made the same attempt where dealers had been actually purchasers of its products and owned them outright. In the minority opinion Mr. Justice Holmes, in so many words, stated that "if the contract involved purely an agency agreement, no one could question its validity."

THE FREEMAN-MILES PLAN.

In the light of the law as lately defined by

the Supreme Court of the United States the present-day method of operation by the Freeman Perfume Company and the Dr. Miles Medical Company seems entirely legal. The plan provides that both jobbers and retailers are in a strict sense acting as agents only; that the goods placed in their hands remain the property of the manufacturer; that in selling the goods to the consumer they are acting for the manufacturer—and thus it is the manufacturer himself who sells the goods to the consumer. In theory there is not a flaw in this plan; in practice it may be that other manufacturers have not adopted it because the courts have not yet decided whether the agreements are in a true and legal sense “agency agreements.” This may be an obstacle which nothing will remove except a decision rendered by the courts on the very point.

On the other hand, however, it is claimed that the Freeman and Miles plan is not feasible because it involves too great an expense with too much detail. This objection seems principally to come from the wholesale druggist, and if this objection is valid, then, notwithstanding the legality of the plan, its general adoption will be greatly hindered.

THE COUPON PLAN.

To meet this objection of impracticability raised by both manufacturers and jobbers, there has lately been brought forward the oft-agitated and discussed “coupon plan.” The new advocates of the coupon plan are more enthusiastic than ever. They are of the opinion that it does not present nearly the obstacles which in practical operation are charged against the present Freeman and Miles plan, and they seem assured of its legality.

The agitation for the adoption of the contract plan at this time is of very great, yes, vital importance, because of the instructions given to the N. A. R. D. Executive Committee at Niagara Falls. I am not prepared to say that the practical difficulties under the coupon plan are less than those presented by the present Freeman and Miles plan, but at this time it would appear that the possible legal features of this plan should first be carefully considered. It is stated with confidence that the question of legality cannot enter into a consideration of the coupon plan as lately proposed. It is pointed out that there is no agreement of any sort, and that if the manufacturer sees fit to

reward the coupon holder for the face value of the coupons, when he has sold the goods at the full price, it can concern no one but the manufacturer himself. The latter is merely presenting the dealer with a gift with which the law cannot interfere.

IS THE COUPON PLAN LEGAL?

The writer is not satisfied, however, that the coupon plan involves no contract. It is hardly necessary to point out that a contract, in order to be such, need not be in writing. It is equally unnecessary to point out that to offer and give a reward for the performance of a certain act, is, on the completion of such a performance, to make and complete a contract. It is my humble judgment that if any manufacturer sells his goods to 46,000 retail druggists, and offers to each of said 46,000 druggists a reward for selling such goods at the price stipulated by him, then when such 46,000 retail druggists have sold at the price stipulated, and have earned and received the reward which he offered, there have been just 46,000 contracts fully executed and completed.

In the light of the Supreme Court decision in the Dr. Miles case, are these 46,000 contracts legal? Naturally the answer depends upon what the contract really means. It is proposed that Smith, the manufacturer, shall through Brown, the jobber, sell to Jones a bottle of proprietary medicine, which is to be sold by Jones to the consumer for \$1.00, and for which Jones is to pay \$1.00. There goes with this bottle of proprietary medicine a condition or promise, which is attached to it in the shape of a coupon, and which is to entitle Jones to 33 cents, provided Jones sells that bottle to the consumer for \$1.00. This condition or promise to pay 33 cents cannot be separated from the transaction under which this bottle of proprietary medicine has been sold to Jones. It is as much a part of the contract of sale as is the medicine in the bottle.

When Jones buys this bottle of proprietary medicine, with the expectation of earning the reward, which is evidenced by his subsequent cashing of the coupon, then it may be claimed with much reason that Jones has bought this bottle of proprietary medicine and has entered into a contract under which its price was restricted. If these premises are correct, then under the proposed coupon plan there would

be 46,000, or nearly all the retail druggists of the country, who would enter into the same kind of a contract restricting prices. Whether this be legal can best be judged from the following extract of the opinion in the Miles Medical Company case:

"If there be an advantage to a manufacturer in the maintenance of fixed retail prices, the question remains whether it is one which he is entitled to secure by agreements restricting the freedom of trade on the part of the *dealers who own what they sell*. As to this, the complainant can fare no better with its *plan of identical contract*, than could the dealers themselves, if they formed a combination, and endeavored to establish the same restrictions, and thus to achieve the same results by agreement with each other."

Of course this question of the legality of the coupon plan is based on opinion only, for as yet no court has passed on it. It may even be claimed that since the manufacturer will not need to depend upon its success by enforcing it against any one, there will be no occasion to draw its legality into question. This might be true, if it were not for the fact that the dealer who buys the goods and sells them at less than the stipulated price, and who thus cannot realize on his coupons, will not be satisfied with such a proceeding, and, being directly concerned, if the plan involves an illegal feature he need only come into court and ask that the manufacturer be restrained from operating under the plan. Again I say that I have my doubts of the legality of such a plan.

where the goods *are sold* by the manufacturer to the wholesale and retail dealer.

WHAT CAN BE DONE.

The writer may be wrong in his opinion that the proposed coupon plan presents legal difficulties, but, if he be right, then in making an effort toward securing the necessary price protection we are confined to the agency agreement. The thought and study of the drug trade should therefore be devoted to removing the objectionable features from the agency plan, or to securing such a change in the law as will permit the small dealer to protect himself. If manufacturers are not adopting the Freeman and Miles plan, because the courts have not yet passed on it, the only thing to do is for the interested parties to take such steps as will bring about a decision of the court. If practical difficulties keep other manufacturers from taking up the plan, then the necessary thing to do is to look into these practical difficulties and seek a remedy. It would seem that these practical difficulties have been exaggerated, but if they really exist to any great extent, and if they do not exist to nearly the same degree under the proposed coupon plan, then I would suggest as a solution that the agency agreement plan be combined with the coupon plan, and thus, as a part of the agency agreement, the coupon plan could be made equally legal. Since each coupon would speak for itself, bearing a serial number, there would be no need for keeping records on the part of the jobber, and thus the much complained of detail would be done away with.

MAKING EFFECTIVE WINDOW DISPLAYS.

Their Arrangement and Care—Qualities that Make a Trim Attractive—The Effect of Unity, Color, and Motion in an Exhibit.

By H. M. CURRY,*
Ellsworth, Kansas.

Some wise comrade has said that "our windows are the index of our own business." That is a fact that too few people realize. Your windows are as surely an indication of what is inside, as your clothes are an index of your character.

Clean, well-dressed windows give you at

*Portions of a paper read before the Kansas Pharmaceutical Association.

once a place in the eyes of a discriminating public, as unmistakably as smart clothes or elegant store fixtures. Aside from this, the most important part of one's business, the profit side, cries loudly in favor of well-kept, daintily arranged, and business-bringing display.

DETAILS OF A GOOD WINDOW.

In the arrangement of a store, the display windows should have careful consideration. If

they are not modern in design, they should be made so. A good window should not be too high above the sidewalk, nor should the other extreme be tolerated. Twenty-four to thirty inches is a good height.

The woodwork or frame should be as light as sufficient strength will permit, and free from all wood trimmings that will harbor dirt—the plainer the better. Good natural wood finish for the inside is best.

The floor should be good, preferably polished or waxed, that it may be easily cleaned and kept so.

The next requisites are a few sensible pieces of window furniture, most of which may be home-made and of great service. When room will permit, it is wise to maintain a small space where window-trimming material may be kept. This does away with much vexation and saves both time and money.

Nearly all trims are simply variations of geometric forms which can be made up of units that are interchangeable, and when once accumulated will serve for all time. This subject I will take up later in a series of demonstrations that have proved very useful. Nearly all window trimmers coincide in the main essentials of successful window trimming and display.

THE CARE OF THE WINDOW.

Windows should first of all be absolutely clean, and, by the way, a boy that can wash a window *clean* is one worth encouraging. If he gets into the corners, keep him. He's an exception and probably a jewel.

The next idea is a weekly change. Except on rare occasions, a display should never remain in a window longer than a week.

Fridays seems to me to be the day for window dressing. In nearly all towns, Saturday is a busy day. More people are in town than on any other day and a clean new display appeals to country people as much as any other one thing.

Then, too, most towns have only weekly editions of newspapers. If your windows are in accord with your advertising, they clinch the argument and help the advertisements to be truthful.

UNITY DESIRABLE.

There is little opposition to the idea that a window, to be successful, should feature but one line at a time. This may be accomplished

in either one of two or three ways. Small quantities of goods, in a setting of well-arranged show-cards, with a harmonious color-scheme, is one. Large quantities of any one thing in rows or uniform designs, oft repeated, and systematically arranged, impress those who see the window with the idea that the goods are right, that the quantity and quality are both desirable and adequate, and that the store displaying the line is doing a good business in that particular article, making it necessary to buy largely.

A single article of merchandise, neatly displayed, often draws attention through sheer audacity. It's like a sharp "bang" as against a rumble of continuous noise which only annoys but does not interest.

MOVING DISPLAYS.

Motion displays are always good, and may be arranged with simple mechanical means. In towns where there is either electric current or water-power the matter is easily solved. One can secure small moving mechanisms at reasonable prices that would soon pay for themselves.

I recently read of a man who built a long tank in his window in which he had placed seven mud turtles, on the backs of which he had painted the letters spelling his name. He offered a reward of \$25 to any one who would catch them so placed that the letters would spell his name correctly.

THE EFFECT OF COLOR.

Attractiveness may be obtained through artistic arrangement or massing of goods and by color schemes that act as foils for the goods.

Any strong color used exclusively and in quantity is bound to attract attention. It will be seen from a distance and, if striking enough, will often induce people to cross the street in order to satisfy the curiosity which it creates. The dainty arrangement of soft tints, in good harmony one with the other, is in better taste for all displays of toilet articles, perfumes, and stationery displays.

Much assistance can be secured from manufacturers of good lines of either of these articles if they be courteously solicited and are assured that their aid will be mutually advantageous.

Fancy backgrounds are excellent adjuncts for some displays, but should be used cautiously and knowingly. Nothing could be more

out of keeping than a poorly selected background that has no relation to the display.

Some of the artistic modern wall coverings offer splendid opportunities, however. With a little care they may be made into beautiful panels and backgrounds that add greatly to the effect of the show-window display.

The subject of lighting the window is of material importance. It is generally conceded that the best light is one which is at the top of the window, so concealed that it cannot be seen from the street, and sheds light down upon the floor and into the window.

THE VALUE OF NIGHT DISPLAYS.

The value of night display is much underrated by many merchants. The best hours of the day are after dark. People who are on the streets at night have more time to inspect displays, are usually more inclined to notice them. A window attractively lighted has much the advantage of a daylight display for the simple reason that the lights are intense and concentrated on the display. Naturally people are led to look at it.

The subject of lighting should not end with the window, as a nice, well-lighted store is always attractive, and in an increased ratio a poorly lighted one is repellant.

Do not let the work of decorating the window be every one's work. Everybody's business is nobody's business. Select the man who loves the work, then give him every encouragement in your power. If he does a good job, let him know you appreciate it. Don't pinch him on expenses. You'll get it all back. Let him out occasionally, that he may see what the other fellows are doing. It is good generalship to know what the enemy is up to. Make him realize the importance of his work, the necessity of doing it well, and that you are depending upon him to keep up the reputation of the store in that respect. You will be repaid a hundredfold. You will have made a partner of him, unconsciously, and a loyal employee is certainly a valuable asset.

In window display, timeliness is an important factor. The goods shown should always be those which are being used at the moment. It is folly to throw opportunity away in displays which have no connection with current needs or present desires.

In this connection I would call your attention to a "Calendar of Window Displays," which has been published frequently in the drug journals as being worthy of preservation. It need not be adopted absolutely, but should be studied and adapted to individual needs. If used as a basis for thought along this line, it will be found extremely helpful.

There are some instances where there is good excuse for lending your windows to the exploitation of the merits of patent medicines, but generally considered, I believe that every thinking man in the drug business can use his windows fifty-two weeks in the year to better advantage blowing his own horn. The greater number of these hand-me-down window displays are nine-tenths manufacturers' and the balance for you. "Jones pays the freight."

THE FRUITS OF GOOD DISPLAYS.

In conclusion let me urge the importance of window display as a part of your advertising scheme. None of us can gainsay the fact that advertising pays, and pays big. Think of five or six largest concerns in the business world you know of and why you know them.

They advertise largely and all the time.

Marshall Field & Co. spend \$50,000 annually for window displays alone. John Wanamaker's first day's business brought him \$24.67. He kept the 67 cents for change and spent the \$24 for advertising, and he kept that system up. Did it pay?

It is useless to spend either time or money in advertising inferior goods. Be sure of your quality, ask an honest price, and there is no reason for being afraid to tell the people about it.

Tell them in the newspapers, and along with that medium of publicity "show 'em"—in a window that is clean, neatly trimmed, and bearing a message of desirable merchandise for sale.

It is equivalent to the cheery smile that greets you as you enter a store where all is bright and orderly. It is as truly a sign of cordial welcome as is a hearty handshake.

It never wears a frown, nor does it ever keep a customer waiting. It is working all the time for and never against you. It never complains of working overtime, but will show evidence of neglect. It is the soul of your business. Keep it sweet.

SHOW-CARD WRITING.

Practice Makes Perfect—Some Specimens Showing what Can Be Accomplished by One Who Tries—Materials Used in the Work.

By **EDWIN P. CREUTZ,**
Wausau, Nebraska.

With sufficient practice any one can become a first-class card-writer. A person does not necessarily have to be a genius to be able to produce artistic show cards. Making letters is more mechanical than artistic. The chief require-

handle. The round ferruled brush gives better satisfaction than does the flat. You will also need a good yardstick with a straight edge and a No. 3 or 4 pencil. With these tools you will be able to duplicate any card shown here, with sufficient practice.

There are several prepared show-card paints upon the market. I have found Letterine, especially the black, to give the best satisfaction. It dries quickly and leaves an excellent

Styles of lettering used by Mr. Creutz.

ment of the would-be card-writer is practice. My advice to those wishing to become proficient in this work is—obtain some good book treating upon this subject and study the alphabets contained therein thoroughly. Note carefully the formation of each letter of the various alphabets. Select some simple alphabet such as No. 1 shown here and practice making the different letters until you are able to make any one correctly without referring to the copy. Try and master alphabet No. 1 before attempting No. 2.

THE TOOLS AND PAINTS.

Buy only the best tools. You will need two or three red sable brushes, say sizes 6, 8 and 12, to start with. Do not use camel's-hair brushes. All cards shown here were made with a No. 12 red sable brush having a quill

Specimens of Mr. Creutz's show-cards.

finish. I prepare most all white and colored paints myself. For white, use zinc oxide c. p. Make a thick paste of it in a mortar with mucilage. Then add water until the oxide assumes the consistency of cream. Pour the paste into jars and allow to stand several days before using as it improves by age.

Colored paints are prepared in the same manner by using dry colors instead of zinc oxide. These home-made paints will also be found excellent for painting signs upon window glass as they can be easily removed with

water. Red lead makes an excellent orange shade for use on colored cards, especially for border-lines on a bright-red card lettered with white, as are the two rose lotion cards shown here.

MAGAZINE COVERS HELPFUL.

The illustrations on these cards were cut from the covers of the *Saturday Evening Post* and carefully pasted on. The Nyal face cream card was dark blue, size 11x22 inches, lettered with white and outlined with orange. Illustrations such as shown here help greatly to improve the appearance of cards advertising toilet articles, etc. Keep a file where all such pictures found in magazines and trade papers are placed for future use.

The other cards shown here were painted with black letterine upon white and need no further description except that the larger cards

were 14x22 inches. A "Corn Huskers' Lotion" sign was made by pasting white writing paper over a frame 3 by 6 feet in size, the lettering being black and border-lines red. Large signs such as this one, placed in front of a store, greatly stimulate the sale of goods advertised. They, at least, are not expensive to make.

In conclusion, I wish to say, do not become discouraged if you cannot make A No. 1 cards at the first attempt. If you are willing to give an hour each day for a month to practice, you will be surprised at what you can accomplish at the end of that time, providing you are sincere in your efforts. This work will be found very fascinating. After you once "get the hang" of it, you will not stop until you are able to make as good cards as I have shown here, if not better.

"MY BEST ADVERTISING SCHEME."

Three Live Plans—Voting Contests as a Means of Stimulating the Sale of Christmas Goods—Hiring Youngsters to Canvass Their Friends in the Interests of the Store—Schemes that Will Be Found Especially Remunerative During the Holiday Season.

A DOLL VOTING CONTEST FOR THE HOLIDAY SEASON.

By JAMES H. MILLER, CHRISTIANBURG, OHIO.

Our Christmas advertising scheme last year was a voting contest. I bought a doll in Sep-

tember and had the cards printed in October. In the November issue of the BULLETIN last year, I saw Frost & Maffit's report of the contest held by them the year before. We gave a first and second boys' prize and a first and second girls' prize. At first we were rather disgusted with the contest. It required so much explanation. There were the usual knockers. Some in the country said it was no use to try, as the town children would get all of the prizes. Some in town said no one but the doctors' children stood a chance as they bought so much medicine.

Finally, however, more interest was shown. Some worked pretty hard electioneering for their little friends, with the result that our sales the week before Christmas were \$337. We did not carry any expensive toilet or fancy sets. The highest priced was \$3.50. Sales consisted mainly of 10-, 25- and 50-cent goods. The sales for the month were \$130 more than those of December, 1909. And the expense amounted to about \$12 for tickets, prizes, advertising, etc., so that we feel that we were paid for our trouble.

Another season we want to get all the

VOTING CONTEST

To the Boy receiving the greatest number of votes,
an Acetograph or Post-card Lantern, - Value, \$5.00
Second Prize, The American Boy for One Year.

To the Girl receiving the greatest number of votes,
a Fine Dressed Doll, - - - Value, \$5.00
Second Prize, an article selected, - - - " 1.00

One vote with every 10c. purchase. 12 votes with every \$1 purchase.
(Contest begins Nov. 25, and ends Dec. 25, 1910.)

tember and had the cards printed in October. In the November issue of the BULLETIN last year, I saw Frost & Maffit's report of the

merchants here interested in a voting contest and give several cash prizes. This will help the holiday trade at home. As we are the only drug store here, we shall get our share of the increased trade.

YOUNGSTERS SELLING GOODS ON COMMISSION.

By GEORGE M. STUBBLEFIELD, KIRKSVILLE, MO.

Last year we adopted a sales plan which proved more successful than we had expected. It should interest dealers in other towns.

We advertised: "Wanted, 50 boys and girls

Won't you please remember me to-day if you buy anything in the DRUG LINE and buy it of the Kirksville Drug Company, asking them that I shall have credit for the sale.

Thanking you in advance,

Signature.

The youngsters distributed this blank among their friends.

at once. Light, wholesome work; good pay." We took down the names of those who responded, together with a few brief notes. We then selected applicants from different locali-

ties and from influential families without limiting the number. To them we offered a 5-

per-cent commission on all the sales they could make, reserving to ourselves the right to withdraw the offer at our pleasure. We made it a point to interest those who had not traded with us before. As a result we at once got the trade of the immediate families of the youngsters and gradually succeeded in interesting their friends.

There is no doubt this plan will work anywhere. The cost is a trifle. The advertising benefit is of a permanent nature, as it develops a relationship between the customers and the store, of a personal as well as a commercial character.

Each boy and girl was furnished with the large circular reproduced herewith. This introduced the youngster and the plan. The

☞ I am now in the employ of the Kirksville Drug Co., the Big New Drug Store 3 doors north of their old stand, East Side Square, and this is the way you can help me: When you want anything carried in a big drug store please go there and buy it and ask them to give me credit for the sale. They give me a commission on all my sales to solicit for them.

☞ If you will do this you will get the advantage of the largest stock to select from. You will get prices as low as good goods can be sold ☞ ☞ ☞

R E A D T H I S

☞ Selling drugs requires skill. Inferior medicines do more harm than good. Many drug-gifts do not know what action is expected from certain drugs, nor how to buy good ones and avoid the "fakes." ☞ Now think what my people have to offer. Can't you see you have much to gain and nothing to lose?

☞ They have had long years of experience as druggists, and have the room, the capital and the goods. ☞ ☞ ☞ ☞

☞ Read this list. You will need some of them today, and please remember to ask that I shall have credit for the sale. ☞ ☞ ☞ ☞

smaller card which we are also printing served as a daily reminder to the customers. A feature of the scheme lies in the fact that the hand-bills and other advertising matter are distributed free by the young people.

ANOTHER VOTING CONTEST.

By H. H. CASSLES, MGR. CITY PHARMACY, CANYON CITY, TEXAS.

We conducted a very successful voting contest last Christmas, with a large increase in business. We offered a beautiful doll that at retail was worth \$25. We advertised through the local paper that one vote would be given with every 25-cent purchase.

The contest began December 1 and closed December 24 at 10 P.M. It doubled our holiday business. Our cash sales on the last day were \$530. This is the most successful holiday selling scheme I have ever seen tried.

SOME CHRISTMAS ADS.

During the holiday season, thousands of druggists will be making a special effort to sell Christmas goods. We have collected several ads. that will be found useful in getting up newspaper announcements and circulars for house-to-house distribution. They were all used last year by druggists.

A CHRISTMAS CATALOGUE.

A somewhat unusual piece of advertising was distributed from Lutes's drug store. Oran, Mo., last year. The general character can be seen from the title page.

OUR CATALOGUE

1910

XMAS GOODS

Lutes' Drug Store,
"Where the Quality is Guaranteed."

Cover of a Christmas catalogue

The catalogue is in the form of a booklet 4½ by 6 inches in dimensions. The ads. aimed to present the most attractive articles carried in the store, although several things escaped mention for the lack of space.

USED IN A STORE PAPER.

Here are a few ads. borrowed from a store paper issued by Thompson & Hagan, of Christiansburg, Pa.:

Christmas Candies.

This is one of the important items during the holidays, and of course you want the best. We have them in nice attractive packages at 40c, 80c, \$1.20, and \$1.60 a box.

Post Card Albums.

They are becoming a necessity to take care of the numerous cards that are now sent to friends, and a gift of one of them will not be amiss. We have them in various sizes and styles from 10 cents to \$1.00.

Hair Brushes and Combs.

We carry a full line of these in staples and in fancy boxes, suitable for gift making. They will bring up pleasant memories as long as they last. The prices are in reach of the slim pocketbook.

Military Brushes.

These are one of the necessary items of every gentleman's toilet, and no more pleasing or acceptable present could be given than a pair of them. \$1.00 up.

Christmas Cigars.

We pride ourselves on the high-grade cigars we carry at all times, and our Christmas line is no excep-

of nice stationery such as you find here. We have just received a lot of local name box paper, embossed. This will make an especially nice present, and only 19 cents. Others at 25c, 35c, 40c and 50c.

Ink Stands.

A nice ink stand always sets off a gentleman's desk, and we have a nice selection of these useful articles. 25 cents up to \$1.25.

MORE STORE PAPER ADS.

Sherwood's Pharmacy of Cleveland also publishes a store paper and takes that means of offering holiday suggestions. Here are two of the Sherwood ads., reproduced in "solid" form instead of the original "display" type:

Number 1:

High-Grade Manicure Sets.

It's not at all likely that you ever saw a more artistic line of Manicure Sets than ours. That sounds like a bold statement—and it is, but the truth is greater than the boldness, and it's hard to make the truth too strong.

Every one is the very essence of refined taste. It is the kind made to use—the kind it's a pleasure to buy and give, because you KNOW the sterling worth. You can see it.

The prices range from \$1.50 to \$6.00.

A nice inexpensive gift. A specially priced manicuring outfit containing:

- One Nail Buffer
 - One Magic Nail Stone
 - One Bottle Magic Nail Bleach
 - Six Linen-lined Emery Boards
 - One Velvet Finish Nail File
 - One Orange Stick
 - One Book Talcum Complexion Leaves
- All for 43 cents.

Number 2:

Perfume Atomizers.

If you would get all the real fragrance from your perfume use an Atomizer. The perfume is evenly distributed—none is wasted, and as the spray is produced the alcohol evaporates, leaving only the fragrance.

Especially for Holiday Trade, we selected a line of real worth and beauty which has never been excelled in the city.

It contains an appropriate gift for man or woman, and our prices are so very reasonable that people with limited means can afford one.

An atomizer is something that can be used by a lady

every day in the year. They are here from 50 cents to \$3.50.

Leather Handbags.

We have quite a fine variety of these indispensable articles of travel at prices that will appeal to your purse. We have the novel shapes and the large roomy kind for carrying all your purchases. Note the small prices, \$1.00, \$1.25, \$1.50 up to \$6.00, and every one full value.

Manicure Sets.

We have these in separate pieces and in sets. There is nothing that appeals more to ladies of refinement than a nice article for her toilet, and these you can count on as being first-class. They are appropriate at all times of the year, but especially should they

appeal to you as a nice gift for the holidays. Prices are moderate, 75c to \$5.00.

Toilet Sets.

These come in nice boxes, silk-lined, and contain Hair Brush, Comb and Mirror, and some of them have the combination with all the manicure instruments. We are the recognized leaders in this class of goods for the holidays. No lady's toilet is complete without these articles. They come in various designs and at prices that will please you. 75c to \$10.00.

Shaving Necessities.

Shaving Brushes, 25c, 50c, 75c and \$1.00.
Shaving Mirrors, 75c up to \$3.50.
Shaving Sets, mug and brush, \$2.00.
Razors, both safety and old style, 25c to \$2.50.
Shaving soaps, creams and talcum powders, to use after shaving. All the popular kinds.

Smokers' Sets and Ash Trays.

Some novel designs in these attractive presents. From \$1.00 up.

A THANKSGIVING WINDOW.

This is a good November trim. It was used last year by J. E. Taylor, of Gridley, Illinois. A rich-plumed turkey displayed against a setting of national colors was the main feature of attraction. A large wish-bone on the right conveyed a greeting to the passers-by.

The products displayed were not peculiar to

indicated, these compounds were intended to relieve the overburdened stomach. The placard read: "Proclamation! We are headquarters for just what you will need the day after."

Presumably the bird in the center lost its head on Thanksgiving day, putting an end to the trim. The whole arrangement was simple.

A trim arranged by J. E. Taylor, Gridley, Ill.

the season, although this trim may well be used to exploit the spices and flavoring agents needed in dressing poultry for holiday feasts. Among the preparations exhibited were fig syrup, celery and iron, sodium phosphate, and pepsin cordial. As the sign above the turkey

Too much variety in a window lessens its effectiveness. The three colors in the flag were enough to attract any one's attention. This display was made last year, as may be seen from the sign under the huge wish-bone at the right of the window.

A PROSPEROUS SOUTHERN DRUG STORE.

Letaw's Pharmacy in Birmingham, Alabama—Started Five Years Ago in a Small Way—Today One of the Most Successful in the Big Mining City—The Owners and a Short History of Their Growth.

Birmingham, Alabama, famous the country over for its iron mines, has undergone a rapid growth in the last decade. And the progress of pharmacy in that city has kept pace with the industrial development that has been going on there. Only recently the Messrs. Letaw

Hyman H. Letaw, junior partner.

completely remodeled their drug store at a cost of eight thousand dollars. A formal opening was held at which every man, woman and child in the country was made welcome. Adding to the cordial nature of their reception were souvenirs, flowers, refreshments and music. The occasion was a gala day for David and Hyman H. Letaw, the successful proprietors of the place, for it marked the fifth mile-post in their career in Birmingham, one which has been attended with much effort.

The two Letaws are young men, natives of Warsaw, Russia, the home of Kosciuszko, the noted revolutionary leader. Coming to America in their early youth they studied pharmacy in New York. Liking the metropolitan experience, they remained there several years. David Letaw worked in a large

drug store, Hyman Letaw served as chief apothecary at the Lincoln Hospital. On going to Alabama each went into business separately, but after a few years the two moved to Birmingham, where they formed a partnership.

The accompanying illustration of their new store shows how well the combination has prospered. Situated in the City Hall building on the corner of Nineteenth Street and Fourth Avenue, the pharmacy now occupies two whole stores, an intervening wall having been removed to double the floor space. The new pharmacy is one of the prettiest in Birmingham. The soda fountain is a handsome

David Letaw, senior partner.

one and is located in the center of the store, as may be seen from the engraving. The total cost of the fountain installed was \$4500. The Japanese parasol surmounting a marble hexagonal column in the center looks extremely pretty, especially when illuminated. The

fountain is distinctly rich in material and design.

The cigar stand in the front of the place is a complete store in itself. It is accessible

est possible time. The youths mounted on the machines are experts at delivery work "just within the last limit of the speed law."

The rapid growth of a business now only

through large doors, and the line of cigars, imported and domestic, tobaccos, and smokers' supplies is unexcelled.

The motorcycle delivery service makes possible the immediate delivery of any article or prescription, in Jefferson county, in the short-

five years old is a tribute to the popularity and methods of the owners. Fair dealing, careful buying, and attention to the small as well as large customers, are a few of the qualities that have contributed to their success in so short a time.

AN EASTERN STORE OPENING.

The Cahoon-Lyon Drug Company of Buffalo Opens a Fifth Pharmacy in the Heart of the City—Crowds Throng the Building Until the Doors are Closed.

The new store of the Cahoon-Lyon Drug Company in Buffalo was opened recently under auspicious circumstances. To celebrate the event the company gave away more than \$250 in checks and much valuable merchandise. The big store was crowded throughout the day, but owing to the excellent manner in which the throngs were handled, there was no congestion. Modern arrangements and a large

force of clerks united to give a quick, efficient service to the customers.

At 10 o'clock in the morning of the big day the new store, which is situated on the west side of Main Street, between Court and Mohawk Streets, was scheduled to open, but long before that time there was a large crowd of interested persons in the vicinity of the place. When the doors were thrown open there was

a rush for the interior of the establishment. The people were enthusiastic but orderly, and nothing happened to mar the occasion.

SOUVENIRS GIVEN AWAY.

Inside the store flowers and toilet articles were given away as souvenirs to the visitors, and a popular drink was served free at the model soda fountain, just within the doors to the right of the entrance. In many of the departments valuable presents were given to purchasers. The various sections were arranged in an attractive fashion, and the clerks did a record-breaking business. More than 10,000 roses and asters were given away throughout the day, and toilet souvenirs were given away liberally.

While the crowds were thronging the store, on the roof men were busy in releasing 5000 hot-air balloons. Each balloon contained a check good for a certain sum of money when presented at the new drug store. Checks ranged in value from ten cents to \$10, and were eagerly looked for in all parts of the city. Finders of checks from the Cahoon-Lyon company balloons could cash them in currency or merchandise, according to the statement contained on the paper. Checks were redeemed until 6 o'clock Saturday evening.

The new modern drug store is located in a four-story building, and is complete in every particular. In the basement is the ice-cream plant, which furnishes ice-cream for all five

The new Cahoon-Lyon store in Buffalo.

stores. The main floor is devoted entirely to retail business. It contains the drug department, rubber goods department, toilet department, candy department, stationery depart-

An interior view of the new Cahoon-Lyon store in Buffalo.

ment, cigar department, soda fountains and other features. The interior is finished in mahogany and hundreds of electric lights stud the walls and ceilings and flood the store with light. Unfortunately the fountain is not seen in the engraving. It lends much beauty to the store.

Particular attention is given to filling prescriptions. Five thousand drugs, each in a separate drawer, are contained in the drug department, and the company has installed a double checking system on prescriptions to insure against mistakes. The entire second floor of the building is given over to the photographic department, which is one of the largest in Buffalo. Executive offices and stock-rooms are on the third and fourth floors. All of the floors are brilliantly illuminated day and night, and a perfect system of ventilation has been installed.

ABUNDANT WINDOW SPACE.

Seventy-five thousand dollars has been expended in remodeling the building to meet the

needs of the drug company. The unique front is a feature that attracts considerable attention. There are virtually six windows in one, running "V" shape. No matter at what angle the store is approached some part of the window display is visible. On the opening day the window trim included drugs, stationery, cigars and toilet articles. Under an electric-studded marquee there is an appropriate sign. Arrangements are now being made to place an electric sign extending ten feet upward from the second story. This will flash the Cahoon-Lyon name far up and down Main Street.

The store opened made the fifth retail drug establishment of the Cahoon-Lyon company in Buffalo. Fifteen clerks are employed in this store and Mr. J. P. Boyle is in charge. The company has sixty-five stores in various parts of the east and middle west. The new pharmacy is the center for the Buffalo chain and the stores in Toronto and Syracuse, nine in all, the general offices being located there. Mr. Hammond is the general manager.

PUSHING MY OWN DENTIFRICE.

The Story of a British Druggist Who Established a Demand for a Private Brand of Tooth Powder—Obtained a Scientific Formula and then Advertised the Preparation Locally—How the Scheme Worked Out.

By ESABY.

Recently it became obvious to the writer that there was room in the list of his specialties for a new tooth-powder. Even if one has a satisfactory formula for carboric tooth-powder that is a ready seller, so many cheap varieties have been put on the market lately that it is desirable to introduce something new, something different and distinctive for which reasonably good prices may readily be obtained.

Most carboric tooth-powders are colored pink. Just why it is difficult to say, save that most people like things as they ought not to be. The carmine, rose pink or dye must, by the frequent use of the powder, have some discoloring effect upon the teeth, which is just what we wish to avoid. Then, too, the coloring agent stains the towels, a thing to which the fastidious housewife will object. There-

fore, in formulating the new tooth-powder the first point was to have it of a natural color.

FORMULATING THE PREPARATION.

Next came the selection of the distinctive ingredients. A review of published formulæ and of monographs in books of reference and an examination of some of the popular dentifrices of the day led to the choice of thymol as the antiseptic. We preferred thymol because of its strong germicidal action even in dilute solutions. Its taste was modified by the addition of menthol and peppermint oil.

Powdered Castile soap was selected for its detergent properties. Certain rival antiseptic powders lay claims to a base of which a portion is soluble. They probably contain boric acid and borax as chief ingredients; the latter being finally selected on account of its alka-

linity. It was found, however, that if any larger proportion than about $7\frac{1}{2}$ per cent was used, it was difficult to satisfactorily mask the taste. Various experiments were conducted in order to make the powder pleasant in taste and odor. Saccharin with oils of wintergreen, rose, rose geranium, and terpeneless lemon were finally added to the ingredients.

The foundation of the powder was precipitated chalk with a proportion of tooth-powder basis, probably a variety of kieselguhr, bought from a wholesale house. Except for the basis, which is inorganic, all the ingredients were soluble and all were antiseptic. The final formula read as follows:

Thymol	72 grains.
Menthol	24 grains.
Oil of peppermint.....	160 minims.
Otto of rose.....	24 minims.
Oil of rose geranium	144 minims.
Oil of lemon, terpeneless.....	40 minims.
Oil of wintergreen	80 minims.
Saccharin, .550 soluble	48 grains.
Powdered Castile soap	4 ounces.
Powdered borax	4 ounces.
Tooth-powder basis.....	8 ounces.
Precipitated chalk	$2\frac{1}{4}$ pounds.

The thymol and menthol should be dissolved in the oils in a large mortar before the other ingredients are added, perfect division being thus insured. The powder should, of course, be sifted.

MARKETING THE POWDER.

So much for the making; now for the marketing. The powder was put up in tins holding about 1 and 2 ounces each, the former to sell at 6d., and the latter at $10\frac{1}{2}$ d. each. With a profitable specialty it is worth while going to a little extra expense to turn it out nicely. "The Self-Made Merchant" in his "letters" to his son expatiates on the wonderful effects of "a little gold on the label." So instead of having an ordinary label printed from type, it is at least worth while to have one lithographed in some neat and tasteful design. One may either draw this himself or get specimens from the trade printers. In proprietary articles a good name is often the precursor to just riches, so adequate thought and attention should be given to originating a distinctive name for the powder.

SAMPLING AND ADVERTISING.

As this powder was not expensive to manufacture, it was decided to take the risk of the

cost of a house-to-house distribution of samples. The question then arose as to how the samples should be packed, whether they should be sent out in small tins or wrapped in grease-proof paper. It was concluded that though tins were more expensive than paper, the powder would not lose its strength and freshness in them and that the expenditure of time and labor in packing would be less, so that method was chosen. Of course the little containers were suitably labeled. The drawing up of a handbill was the next thing. The first copy was criticized as being too long and scientific; so it was cut down and written in a more popular vein as follows:

MAKES TEETH LIKE PEARLS.

JONES' ANTISEPTIC TOOTH-POWDER IS A NEW HIGH-CLASS DENTIFRICE OF MODERN TYPE.

Much Science is involved in the making of a good Tooth Powder.

To begin with, the powder basis must be beyond reproach. It must really clean the teeth, but contain no grit to hurt the enamel. It must be of the sort, too, that won't do any harm if a little gets left between the teeth anywhere.

Then come the antiseptics. These must be thoroughly efficient germicides, but of the right kind.

Thymol is the chief of the three antiseptics used in JONES' ANTISEPTIC TOOTH POWDER. It is remarkable that though obtained from plants and non-poisonous Thymol is more powerful than Carbolic Acid. It is just the thing, too, because it prevents fermentation, and fermentation of food particles between the teeth is the cause of decay.

Another antiseptic is a soluble *alkaline* powder which destroys any unhealthy acid condition of the mouth.

Next dental science prescribes the addition of a little pure soap, because nothing helps to clean even teeth like soap.

But people wouldn't use a "good" tooth powder if it were not also "nice." Fortunately perfumes and essential oils are germicidal. So we utilize a choice combination of these and get a dentifrice that after use leaves a sense of refreshment in the mouth and imparts a pleasant fragrance to the breath.

There are twelve effective ingredients which make JONES' ANTISEPTIC TOOTH POWDER an ideal dentifrice. Its regular use carries health to every crevice of the mouth.

It is sold in boxes at 6d. and $10\frac{1}{2}$ d. (double size). If you have not had a sample in your household there is one waiting for your application.

F. JONES, M.P.S.,

PHARMACIST,

LONDON, ENGLAND.

Good Value in Tooth Brushes, at 6d., 9d., $10\frac{1}{2}$ d., and 1/.

The printers offered a choice of papers and

a pretty and distinctive color was chosen which the writer intends to continue to use for other handbills. Envelopes to contain the samples and handbills were ordered, the name and address of the pharmacist being printed at the bottom of the envelope and the words "Something good inside" in clear type near the top left-hand corner.

The distribution of the samples was backed up by a window display and an advertisement in the local paper. A full-size sample sent to the friendly editor resulted in a very good notice in the reading matter of the paper. The envelopes were addressed to the better class of people and to known customers, but sent without address to others. An endeavor was made that *every* house in the district should receive a sample. The doctors have full-sized samples, and the dentists also, if sympathetic. My apprentices have instructions that a sample is to be given to every customer who has not received one and asks for it, to every purchaser of a tooth-brush, and to every one who buys a proprietary dentifrice.

The tooth-powder began to sell from the samples before they had been out six hours, and from the newspaper recommendation before my own copy had been delivered to the paper. All this is evidence that a good tooth-powder should be one of the pharmacist's best-selling specialties.

Real Fresh Drugs.—

French pharmacologists claim that in the usual drying of drugs the enzymes contained in them act during the process and change the character and quality of the drug. For very active and permanent preparations sterilization of the fresh drug by boiling alcohol is found effective, and apparatus are made for that purpose. It is stated that an extract of kola nut made from the fresh drug with cold alcohol is dark in color and contains free caffeine, whereas one made with boiling alcohol is nearly white and contains no caffeine in free state. Comparative extracts made from fresh, sterilized plants and from dried plants show a loss in activity in the case of aconite leaves of 31 per cent, of digitalis of 21 per cent, of aconite root of 10 per cent, and of colchicum corm of 26 per cent.

With belladonna and hyoscyamus, extracts made from the dried drugs were found to be stronger in alkaloids than those made from fresh. On the other hand, tincture of gentian, made with strong, hot alcohol, is more permanent and much stronger in gentiopicrotin than when made with cold, 60-per-cent alcohol.

PROFITS AND EARNINGS

A TEXAS STATEMENT.

A Texas druggist has been in business for five years in a town of 1000 inhabitants. Though he had a hard time getting started, the last two years have been very satisfactory. In discussing his affairs he lays stress on the need of knowing one's expenses. He says that even though the cost and selling price of goods be familiar to the druggist, if he does not know exactly how much it costs to do business, the profits will fall below his own estimate. He submits the following figures of his business:

Stock July 1, 1910.....	\$3,335 13	
Purchases for year.....	8,376 54	
Expenses for year.....	1,400 00	
Net profit for year.....	4,335 67	
		<hr/>
		\$17,447 34
Stock July 1, 1911.....	\$ 4,205 66	
Sales for year.....	13,241 68	
		<hr/>
		\$17,447 34

All accounts considered doubtful were figured off and are not shown in this statement at all. The point our friend observes is the low expense of doing business. There are very few drug stores, he says, doing this volume of business that do not employ more than one man.

The stock on hand July 1, 1910, was \$3335.13. Adding this to the purchases of \$8376.54, we have a total of \$11,711.67. Now the goods left at the close of the year amounted to \$4205.66, which, subtracted from \$11,711.67, gives the cost of the goods sold, \$7506.01.

Adding the expense of \$1400 to the net profit of \$4335.67 we get \$5735.67, which added to the cost of the goods sold gives sales of \$13,241.68.

Adding the cost of the goods, \$7506.01, to the expenses, \$1400, and subtracting the result from the sales, we find the net profit is \$4335.67. Adding \$1400, the expense, we get the gross profit or \$5735.67.

Dividing the expenses, \$1400, by the sales, \$13,241.68, we find the percentage of expense is 10.57. This is altogether too low.

Fourteen hundred dollars will not include

the manager's salary, rental, heat, light, etc. Perhaps the proprietor owns the building and neglected to figure in the rental or interest on his investment. The showing is too good to be true. There must be some omissions somewhere.

Dividing the gross profit by the sales, $\$5735.67 \div 13241.68 = 43.31$ per cent gross profit, which is large. Accepting the estimate of our correspondent for the percentage of net profit, 32.74, we find it extremely high.

LETTERS

This is where our readers exchange opinions and practical suggestions with one another. The Editors are always glad to receive short letters on subjects of mutual interest.

THE DRUG CLERK OF THE SLUMS.

To the Editors:

The interesting phases in the life of a drug clerk of the slums are hardly known to his fellow clerks who work in the more "dignified" drug stores.

Of all the martyrs who have been heard from in the history of drugdom, he, poor soul, is the greatest martyr of all! By his fellow clerks and pharmacists he is considered undesirable, inadequate, and unqualified to attend to the ordinary duties of a clerk. He is feared and considered inhuman. Feelings—well, he hasn't any.

Not very long ago, on applying for a position, I was asked where I had worked before. When the prospective employer found that my time had been spent chiefly in a drug store of the slums, he said, "Since your training was among foreigners, who have to be treated like cattle, I cannot employ you." Here I was condemned without even a chance to prove my qualifications.

On another occasion, when I applied for a position, the proprietor inquired: "What part did you play in the assassination of a government official?" "No part," said I. "Why do you ask?" "Because," came the reply, "your name looks so anarchistic!"

It is with a view to dispel these ideas and prejudices that I am endeavoring to picture the class of people with whom we deal, and the many requirements and qualifications of our clerks.

The foreigner, on entering the drug store, expects to be treated with courtesy. He feels that the pharmacist, an educated man, is also trained in manners. The clerk, on the other hand, knows what is expected of him and sees to it that his customers are waited on to the best of his ability.

Being a stranger, the foreigner looks to his pharmacist for information of every nature, keeping him as his adviser on all matters. Thus, for instance, he will often come in to ask whether the Cyprus First Reader has any advantages over the Graded Literature First Book, or whether his boy ought to give up school and learn such and such a trade. Such grave responsibilities are laid on the shoulders of the drug clerk of the slums.

The clerk must be well read. He must know

A drug clerk in the slums acting as mentor and information bureau.

where to get his information, for he is in contact with people coming from various countries who naturally expect him to know what they ask. Catering to people of such varied nationalities, the clerk's knowledge is broadened. He is not confined to merely knowing one language. Most of the clerks speak four or five languages fluently, and are familiar with foreign pharmacopœias and drug journals.

Very few of the patent medicines find ready sale in the foreign quarters, for self-medication is considered almost criminal. Good prescriptionists are abundant, and every drug store does a good prescription business. Although the hospitals and dispensaries are competitors, the greatest portion of trade is done at the drug store.

The clerk, besides knowing the language and

his pharmacy, must be a student of human nature. He must know when and what to speak, and each customer must be treated individually.

In view of these facts, is it not fully time for our fellow clerks and pharmacists to dispel the prejudices which have so long existed and been so harmful to the clerk of the slums? Give him a fair chance and he will show you that he is the equal if not the superior of many other clerks. MORRIS HAIMOWITZ, P.D.

Philadelphia.

TEN PRACTICAL SUGGESTIONS.

To the Editors:

Here are ten more ideas that may be of value:

1. Many people call for a "yellow healing powder containing no iodoform." They want a germicidal antiseptic powder for wounds, ulcers, etc. In some localities the following will be found to be satisfactory:

Dithymol-di-iodide1 drachm.
Acetanilide7 drachms.

M. et sig.: Apply locally.

Retail at 15 cents per drachm.

2. Do not do any detail work (with samples) among your physician friends. Every druggist knows the fate of the average sample. At an opportune time show him the formulæ of your own make of pharmaceuticals. If you wait for him to experiment on a case with a "sample" it will be a long time before you will fill one of his prescriptions for that special formula.

3. If you employ delivery boys give each one a number and a book. Keep a record of every C. O. D. package that goes out. Make each boy "check in" at night from *his own book*, keeping tally on your record. You can thus trace every C. O. D. package and amount.

4. Don't buy goods from "mail-order" houses. To the druggist who resents this advice and flares up with "Why not?" we have nothing to say.

5. Don't barter your self-respect, and at the same time commit an outrage on the innate sense of refinement of your customers, by flaunting in their very faces, as it were, a display of suspensories, syringes, etc. The people still possess some rights. One of them is the right to trade with a druggist who has

the proper conception of the "eternal fitness of things."

6. A "fever blister" or lip sore may be aborted by using spirit of camphor persistently upon its first appearance.

7. If you really wish to keep in close touch with your physician friends, send each one a copy of the N. F. accompanied by a statement to the effect that you are prepared to dispense any of the preparations contained therein. [Note: Be prepared!]

8. If you place any value on the good-will of the physicians, don't advertise rank nostrums in your space in the papers.

9. Old-fashioned "turpentine" soap, a good mop, and a pail of pure water, combined with a liberal amount of "elbow grease," will be found to be more conducive to the removal of dirt from linoleum than any of the highly exploited wonder-workers.

10. Don't make a "Devil's Auction" of your window. Group one class of articles at a time. For instance, fill your window with assorted brands of talcums. Then advertise talcums. At another time fill the window with soaps and advertise the soap.

"One thing at a time,
When advertised well,
Will sell many goods,
As many can tell."

Montgomery, Ala. CRAWFORD T. RUFF.

A LETTER WHICH RELIEVES THE MONOTONY OF THINGS.

To the Editors:

I have become very much alarmed over the condition of the BULLETIN OF PHARMACY, and though I am a busy man I cannot but stop and utter a warning which may or may not be too late even now. At this writing the thermometer in our region of the country is hovering between 85 and 90 degrees, but I learn that this is not true of the ice-bound region where you people dwell. Down here in the summertime we do business in the store appareled in trousers and shirt, with possibly the additional luxury of a belt. Our climate is such that we wait upon the best ladies of the land in this costume. As for the ladies themselves, they go without their hats and most of their clothes. At least it looks to a casual observer as though it had about gotten down to hobble skirts and shoe-strings.

But I'm getting a little off the subject. To

return to the matter in hand, let me say that I noticed some months ago that you had adopted a new cover for the BULLETIN a la Southern style, and had asked your friends to tell you just how they liked it. I noticed some commendatory statements afterwards in the journal, and I was surprised!

It seems to me that you have perpetrated a great breach of etiquette in practically taking the coat off your journal and letting it go around in shirt-sleeves. You seem to be oblivious to the fact that cold weather is rapidly approaching. Throwing aside all questions of etiquette, I can see croup, catarrh, pneumonia, and a whole army of ills following in the wake of that coatless journal and ready to pounce on it at the first chance.

Every time I pick up my journal nowadays the first thought is: "I wonder who has been pulling the cover off my magazine!" And now that winter will soon be here, let me advise you to go down to Levi's and get a hand-me-down suit to cover its nakedness—green, red, anything will do. Hoping my warning is not too late, I am, very cordially yours,

Meridian, Miss.

GEORGE W. STAPLE.

P. S.—Remembering the genial philosophy expressed in genial language which has characterized the many articles published by your chief editor, Mr. Mason, I have been trying to write up something as an antidote. The subject which I have had in mind is the following: "Business is war, war is hell, and therefore business is hell when considered with particular reference to the drug business."

TWO PRACTICAL SODA FORMULAS.

To the Editors:

We do considerable soda business and possibly the formulas for a couple of our good sellers will come in handy. At this time of the year hot drinks claim much of our attention. The following is a leader for a 10-cent drink:

Rinse a shaker and cup with hot water to warm them. Into an ounce of warm (not hot) water break one egg and shake thoroughly. In the warm cup dissolve 2 teaspoonfuls of chocolate mixture consisting of powdered chocolate and sugar, 4 to 1, in a small amount of hot water. Add the egg mixture, top with whipped cream or a small amount of ice cream, and a dash of nutmeg.

Our orange soda is a seller and this is the way we make it: Nine oranges are grated and the grated peel ground with one pound of sugar. Then we add the juice of the oranges and thoroughly incorporate enough simple syrup to make one gallon. We serve this in mineral glasses, adding the syrup last. The drink certainly has a true orange flavor.

DOLLAR IDEAS

DISPENSING OILS IN ELASTIC CAPSULES.

Stewart J. McGee, Berkeley, Cal.: This idea if carried out is the means of making excellent profit on the liquids contained in elastic capsules. Castor and cod-liver oils are the best sellers. Colchicine salicylate, creosote, and creosotal are popular too.

1. Filling.

(a) Have rods bored with holes for holding the opened capsules, one or two dozen each, as shown in Fig. 1.

(b) Keep the tops to melt on water-bath for sealing purposes.

(c) For a small number of capsules use a

Fig. No. 1.

medicine dropper fitted with an atomizer bulb, as in Fig. 2.

(d) For a large number set up an automatic filler with ring stand, as in Fig. 3. Put the oil in a wide bottle. Then invert the bottle in a funnel having a rubber tubing attached, with medicine dropper and syringe shut off as shown in the illustration. Capsules can be filled with

Fig. No. 2.

greater speed this way. If the oil is thick, warm it a little.

2. Closing.

(a) Be sure no oil is left on the edge of the opening, since this will prevent thorough closing of the capsule. Remove all traces of oil by gently brushing the capsule with a small camel's-hair brush dipped in carbon tetra-

chloride. The tetrachloride evaporates immediately.

(b) Dip the wire ring as shown in Fig. 4 into melted gelatin, place the film of gelatin down over the capsule so that it adheres to the

Fig. No. 3.

opening, and then draw away the wire by an upward rotary motion. With the rod held in the left hand, the wire dipped into the melted gelatin kept constantly on a water-bath, very little time is consumed in sealing.

3. Finishing.

(a) Make sure every capsule is tightly closed by testing each one. This is done most quickly by taking one in each hand and gently tapping it upon a large filter-paper or blotter

Fig. No. 4.

placed upon the table. Slowly revolve the capsules while tapping. This test is very necessary, since one leaking capsule will give the taste of the oil to all the rest. Leaky capsules are put aside, brushed with the tetrachloride, and sealed again. Leaks are noticed by the

dark spot which immediately spreads itself upon the paper.

(b) Now put them all into a shallow dish and wash thoroughly with a little tetrachloride by pouring them from one dish to another two or three times. This leaves them as clean and bright as new without the slightest taste of oil.

(c) A convenient stock-container is a plaster-box. It is shallow, strong, and looks neat. Have a well-written label containing the selling price per half dozen and dozen upon the side.

These capsules eliminate the taste of all unpalatable oils and will sell in most every case where mentioned. The gelatin dissolves quickly and the best effect of the oil is obtained.

PRESERVING ESSENTIAL OILS AGAINST A TEREBINTHINATE ODOR.

R. L. Villere, New Orleans, La.: The air and light which are constantly acting upon essential oils are really the cause of this rank smell.

A bottle of any essential oil kept well filled and away from light will remain fresh and free from terebinthinate odor for an almost indefinite length of time.

Essential oil bottles can be kept always filled to the cork by replacing the oil removed by an equal amount of water. The oil floating on top and not mingling with the water is naturally not affected by it.

I have used this process for over 12 years with great success and could submit a sample of oil of lemon of that age which is just as fresh to-day as it ever was.

A FORMULA FOR MAKING BASHAM'S MIXTURE.

H. K. Schwartz, South Bend, Indiana: From time to time you have published formulas for making Basham's mixture. We have a method that requires little time.

We always have two solutions made up as follows:

- (1) Ammonium carbonate,.....90 grammes.
Distilled water, enough to make..900 Cc.
- (2) Acetic acid, U. S. P.....300 Cc.
Water, enough to make.....900 Cc.

One has only to mix equal parts of each so-

lution and he has U. S. P. ammonium acetate solution, as the following formula will show:

125 Cc. acetic acid solution contains 42 Cc. acetic acid, U. S. P.

125 Cc. ammonium carbonate solution contains 12.5 grammes ammonium carbonate.

In the U. S. P. formula, solution of ammonium acetate is used, but here that salt is formed by the reaction between the acid and the carbonate; 100 Cc. of diluted acetic acid and 5 grammes of ammonium carbonate multiplied by $2\frac{1}{2}$ equal 250 Cc. of diluted acetic acid and 12.5 grammes of ammonium carbonate.

250 Cc. diluted acetic acid contain 42 Cc. U. S. P. acetic acid.

FORMULA FOR 500 CC. BASHAM'S MIXTURE.

Acetic acid solution.....	125. Cc.
Ammonium carbonate solution....	125. Cc.
Diluted acetic acid.....	30. Cc.
Tincture of iron.....	20. Cc.
Glycerin	60. Cc.
Aromatic elixir	60. Cc.
Water sufficient to make.....	500. Cc.

A CABINET SUGGESTION.

P. I. Minton, Plainfield, N. J.: Systematize your Diamond Dye cabinet. It will save you time and trouble. Start from the top of the cabinet and number 1-2-3-4-5-6-7-8-9-10 and so on. Next go over your color book and number correspondingly. For instance: If No. 1 in cabinet is brown, look up brown in the book and mark it No. 1, and so on through the whole book. You cannot imagine how much time this saves. Nearly every lady wishes to see the color book, and if she selects green for cotton, you have the number before you. Simply go to the cabinet and pick it out. This same system nicely applies to a Munyon cabinet.

ADHESIVE LABELS FOR COMBS AND BRUSHES.

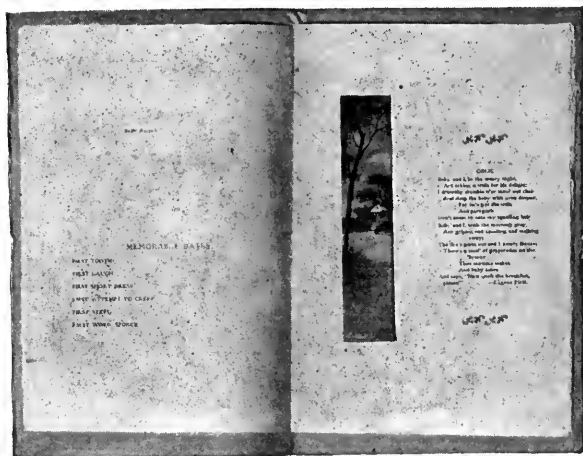

A. C. Williamson, Fulton, Ill.: We always had a hard time marking combs and brushes. Gummed labels will not stick on combs, and tags do not look very good on them, so we take one-inch adhesive tape and cut it up into pieces the size of small labels. These are then stuck on rubber combs and a lot of other things. It is the best scheme we have found yet.

BUSINESS HINTS

Specimens of druggists' advertising are solicited for reproduction or comment in this department of the BULLETIN.

A Baby Journal.—

H. W. Lahr, of Glasco, Kansas, has always made a specialty of appealing to mothers for their trade in baby supplies. His method of sending "letters of welcome," circulars, samples and the like to homes where new infants had appeared was described in an interesting article in the June issue of *Modern Pharmacy*. Mr. Lahr's latest step in this direction was to get out what he calls a "Baby Journal." Two inside pages of this unique brochure are shown in the accompanying reproduction, greatly reduced in size. Altogether the brochure contained 18 pages with cover, and the thing was gotten up so artistically that every

mother could be depended upon to keep it permanently. There were several blanks for data regarding the baby, such as the name, the date of birth, the weight from month to month, etc., together with several vacant panels into which could be pasted photographs of the baby. Then there were several verses taken from the poets, while for illustrations there were three actual photographs of scenes in Glasco, as well as several narrow panels like that shown in the specimen pages reproduced in our engraving. The latter were photogravures in color and added greatly to the beauty of the booklet. That every mother would use this baby journal, and keep it permanently, could scarcely be doubted. Mr. Lahr presumably mailed one whenever he learned of the birth of a baby anywhere within reach of his store.

Free Lime-water.—

We have always felt that no druggist should let anything go out of the store without a profit. But for purposes of advertising it sometimes pays to make an

exception to this rule. Charles Minarcik, Jr., of Brooklyn, N. Y., has been giving away lime-water for about a year with a decided increase in his sale of baby foods, milk sugar, nipples, etc. The character of the label used by Mr. Minarcik will be seen from the accompanying reproduction. At the bottom appears an

LIME WATER

WE GIVE IT TO YOU

FREE

To encourage the use of this valuable medicine we make no charge for it.

Don't be afraid to get some when you need it. We always have on hand a fresh supply of all kinds of

BABY FOODS AND NURSERY REQUISITES.

ad. of baby foods and nursery requisites, the sale of which more than compensates him for the free lime-water.

A Liniment Window Display.—

At the last annual meeting of the New Jersey Pharmaceutical Association, Charles W. Holzhauer read a paper on a liniment window display. Since Mr. Holzhauer is a man of unusual taste in window dressing, his ideas are worthy of notice. To quote:

"What can we do to create a demand for and sell more goods which yield a good profit, instead of over-priced articles which barely pay expenses? This is a question which is of vital interest to every pharmacist.

"Probably the cheapest and one of the best ways in which we can do it is by using the display space of our show windows to good advantage. The value of window displays cannot be overestimated, and if put to good use will return a handsome profit to the store. What class of goods should we show in our windows? Certainly only such goods as will yield a respectable profit.

"Some time ago we arranged a display of a liniment which we had prepared in a small way for a number of years. The trim not only sold the goods while in the window, but also created a good demand afterwards. So, although it is now several months since we made the display, we are still having calls as a result of it. To catch the eye of the passer-by, and to get away from the usual row of bottles often stood upon the floor of the window, we made six small photographs of people in various attitudes,

showing the uses to which the liniment might be put. One represented an old man rubbing his ankle, another rubbing his neck. Another showed a boy rubbing the lame back of another boy, and still another rubbing a sore wrist.

"These pictures we had enlarged and hung them prominently in the center of the window so as to catch the eye of any one passing. Under each picture we suspended a small sign with a few catchy phrases descriptive of the liniment and its uses. The bottles, arranged in pyramids and a large price card upon the floor of the window, completed the display. As a result we sold in two weeks as much of the liniment as we had sold in a year before, and created a demand for it. The total cost was not more than four dollars, yet it attracted the attention of nearly every one who passed by and returned a substantial profit on the investment of money and labor.

"It seems to me that as a rule we do not pay enough attention to one of the most valuable assets we have, namely, giving more thought and attention to our windows, and the class of merchandise to be displayed in them. How often do we see a window full of an article which if even sold at its full retail price will yield only a small net profit, and which is probably cut in many instances to the regular wholesale price to the pharmacist. Is it not foolish for us to give away one of our best assets for nothing, for the display of an article which does not yield anything like an adequate return?"

Some Legends for Show Cards.—

G. R. Thomason, of Stockton, Kansas, keeps cards on the show-cases, changing them each week. Special stands are used for displaying them. The signs are also exhibited in the window. Mr. Thomason finds the plan a very valuable method of advertising, and submits the following text for show-card signs:

THOMASON'S HEADACHE WAFERS

Try a box of THOMASON'S HEADACHE WAFERS.
They are guaranteed.

* * *

IN READINESS ALWAYS.

Whatever your drug store needs are, in season or out, you are pretty sure to find them here. People have come to expect that of us and they are never disappointed.

PRACTICAL PHARMACY

Compound Syrup of Squill.—

C. A. Duncan, of Dallas, Texas, in a paper read before his State association, commented on compound syrup of squill. He called attention to the troublesome character of the official formula and pointed out its tendency to become unsightly after a short time.

The present process requires that eighty cubic centimeters each of fluidextract of squill and senega be evaporated on a water-bath to 100 grammes. Professor Cook has observed that it is extremely difficult to do this at a low temperature. The purpose of the evaporation is to remove the alcohol from the fluidextracts, and the question is asked, why is it necessary to remove this small quantity of alcohol, as other syrups contain even larger proportions of alcohol? Professor Cook also makes the recommendation that the fluidextract of squill be heated to remove the albumin.

Furthermore, the fluidextract of squill contains acetic acid and the fluidextract of senega potassium hydroxide.

After considerable experimentation the following formula was found to produce a beautiful clear syrup that has stood for five months and is free from precipitate at present, there having been no appreciable change:

Fluidextract of squill.....	80 Cc.
Fluidextract of senega.....	80 Cc.
Antimony and potassium tartrate....	2 grammes.
Glycerin	100 Cc.
Purified talc.....	20 grammes.
Sugar	750 grammes.
Solution of potassium hydroxide,	
Water, of each a sufficient quantity to make	1000 Cc.

Heat the fluidextract of squill to boiling, strain and exactly neutralize the product with sufficient solution of potassium hydroxide. Evaporate the fluidextract of senega on a water-bath till reduced to one-third its original volume. When cold mix with the fluidextract of squill and incorporate with the mixture, intimately, the purified talc. Add 350 Cc. of water, filter, and pass enough water through the filter to obtain 400 Cc. of clear filtrate. Add to this the antimony and potassium tartrate previously dissolved in 25 Cc. of hot water. To this liquid add the sugar, glycerin, and enough water to make the product measure 1000 Cc. Dissolve the sugar by agitation without heat and strain.

A number of different methods were employed in the effort to get a satisfactory syrup. With neutralization and without neutralization, with and without evaporation, with and without glycerin, and of all the samples made the only one worthy of being called a syrup to-day is the one made by the process submitted.

Mr. Duncan expressed his obligation to C. A. Allen and M. L. Zacha for laboratory work and suggestions made while conducting this series of experiments.

Sanitation in the Store.—

J. Leon Lascoff, in a paper read at the last meeting of the New York State Pharmaceutical Association, declared that the hygiene of the drug store is a matter of great importance, especially in the prescription department. But he went on to say that little or no attention is directed toward proper sanitary conditions; and, strange as it may seem, the appearance of the prescription department is usually indicative of very unhygienic surroundings.

"It shows in the mixture, pill, capsule, powder, ointment, etc., and in the cork, bottle, and label. A prescription counter made of wood is not sanitary, as wood is absorbent and takes in the oil and greases. I personally use a glass-covered counter backed up by a green-colored billiard cloth, which prevents the glass from cracking, and the color is pleasing to the eye. The glass is easily cleansed and no absorption takes place. For making ointments, I have also a glass slide tablet which can be pushed in and out as necessity demands, and which is easily washed with a little alcohol or ether.

"Rolling the pill mass with the fingers (which as a rule are not clean) is a very unsanitary method. I have for the past few years been trying to devise a method of overcoming this habit, and am now using a blower (as per demonstration), which helps to soften the mass and also makes it easier to roll the pills out in good shape with the assistance of the pill-roller, thus avoiding the use of the fingers as much as possible.

"There are other important truths in regard to sanitation which I will not at this time point out, such as the method of filling capsules with the hand, especially in summer-time; but will reserve all these for some special paper. From these facts you will see how the physician who visits your prescription department will observe your methods and the sanitary procedure displayed by you, and will gladly recommend you in preference to another pharmacist less sanitary, especially when the physician himself is thoroughly trained in sterilization. This again will help build your reputation."

Surprising Variation in Prescription Bottles.—

E. F. Heffner, in a paper read before the Pennsylvania Pharmaceutical Association, pointed out the vana Pharmaceutical Association, pointed out the same size. As a rule they do not run even, which makes it necessary to measure a prescription in a graduate before emptying it into the container. The wisdom of that precaution may be seen from the following data showing the capacities of one dozen of each size of the regular graduated trade bottles:

Supposed ozs. capacity.	1	2	3	4	6	8	12	16
dr.	oz. dr.	oz. dr.	oz. dr.	oz. dr.	oz. dr.	oz. dr.	oz. dr.	oz. dr.
8	2	2 6	3 6	6	7 6	11	16 5	
8 1/8	2 1/8	3 3/8	3 3/8	6 1/8	7 6	12	16 3/4	
8 1/6	2 1/6	3 1/6	3 6	6	8 1/2	11 7	16 4 1/2	
8 7/12	2 7/12	3 2	4	6	8	11 7	16 1	
8 3/8	2 3/8	3 1	3 6	5 7	7 6	11 4	16 3	
8 1/4	2 1/4	3 1/4	3 5/8	6 1	7 5/8	12	16 3/8	
8 3/4	2 3/4	3 1 1/4	3 6	6	7 0	11 6	16 1/2	
8 1/2	2 1/2	3 1 1/2	3 5/6	6 1/2	7 1/6	11 7	16 3	
8 1/3	2 1/3	3 1 1/3	3 6	5 7/8	7 7/8	12	16 3/3	
8 2/3	2 2/3	3 1/2	3 6	5 7	8	11 7 1/2	16 1 1/2	
8 1/2	2	3 1	3 7	6	8 3	11 7	16	

These results show a variation in some cases of 15 per cent below or above the proper capacity. And when one fills a bottle full that holds 15 per cent more fluid than it normally should, the patient receives 12 1/2 per cent less than the physician ordered. When, on the other hand, the bottle is 15 per cent under capacity, the dose taken by the patient is 18 per cent in excess of the amount prescribed.

CAPSULES OF SCIENCE

Prepared by PROF. W. L. SCOVILLE.

Scintillations.—

Gitalin is the name of another glucoside isolated from digitalis. Being the last it is "the thing."

The annual production of radium at the Joachimsthal factory is about 28 grains—a little more than 2 grains per month!

Alundum crucibles are replacing clay because they last much longer and are more refractory. Platinum can be melted in them. Alundum is fused alumina.

Dr. Austin Miller says that hexamethylenamine in doses of 15 grains, four times a day, will if taken at the beginning abort a cold. It should be accompanied by copious water-drinking.

Professor Dixon says that synthetic emodin is a failure as a cathartic because it is absorbed too readily. In rhubarb, cascara, aloes, etc., the extractive matters hinder absorption of the emodin and a better action is obtained.

Ferrous salts can be completely extracted from an aqueous solution by shaking with a benzene solution of naphthene acid, which dissolves them. This method may be used for separating iron from other salts.

The nearest approach to artificial daylight is obtained by passing the light from a tungsten lamp through blue and green glass and a film of gelatin colored with rosazene. The loss in light is considerable.

The present price of highest-activity radium salts is \$5200 per grain, but it is not steady in the market. The United States contains no radium-containing minerals of commercial importance.

A Food or a Stimulant?—

Dr. W. H. Thompson insists that beef extract has both a direct and an indirect nutritive value. He found that when beef extract was given to dogs mixed with a standard food, the dogs increased in weight from 10 to 20 times the amount of beef extract given. He further states that beef extract augments the digestive power of the gastric juice, and thus acts as an indirect nutritive. He does not admit that it is merely a stimulant, but claims for it important nutritive value.

The New Atom.—

A Russian chemist now defines an "atom" as "an object such that division of it gives rise to objects of another order." Thus an atom of an element is composed of electrons and may be resolved into atoms of a lower order. A chemical element is "a complex which has certain characteristics and occupies a definite position in the periodic system."

The Elixir of Life.—

Two French chemists claim that buttermilk which has been obtained by the natural souring of milk contains more lecithin than fresh cow's milk, and as much or more than human milk. They say that the lecithin adds greatly to its value as a food, and also gives it an important medicinal quality.

Purer Foods.—

E. Gudeman says that an alloy containing as little as 0.5 per cent of gold has been found which can be used to cover the iron in cans to be used for food, and which is as resistant to corrosion as gold itself. Two ounces of gold in this form will cover a ton of iron, and will cost 12 to 15 times as much as tin plate. He thinks that for canned foods it is worth while.

Sanguinarine.—

A Russian chemist claims that sanguinarine does not exist in bloodroot as a salt, but is in the form of a more stable compound, the salts of which have a red color and which hydrolyze in aqueous solution and yields sanguinarine. This may explain why preparations of bloodroot are not stable.

BOOKS

ANOTHER EDITION OF GOULD'S POCKET MEDICAL DICTIONARY.

This is the sixth edition of Dr. George M. Gould's popular book. The author explains that it has been made necessary by the rapid enlargement of medical terminology, and by the constant addition of new words to the language. The present book has 142 pages more than before, while the number of new words has increased by nearly 5000. The total number of words now defined is 34,613. Gould's medical dictionaries are of course standard books in the language, and no further praise of them is needed at this time. The Pocket Dictionary costs \$1.00 and is published by P. Blakiston's Sons & Co., 1012 Walnut Street, Philadelphia.

THE CLERKS HAVE A JOURNAL.

The first issue of "The Drug Clerks' Journal" has found its way to our office. It is the official organ of the California Drug Clerks' Association, and it is a live representative of a live society. The C. D. C. A. has done things. It has brought about shorter hours, better compensation, sick benefits, death benefits, Sunday closing, and has conducted an employment bureau successfully. The editor of the Journal is Will E. Murphy, vice-president of the association, and the business manager is J. S. O'Callaghan. The first issue contains a history of the organization and has a number of excellent articles from well-known pharmacists and clerks on the Pacific coast.

The School of Pharmacy of the University of Wisconsin has reintroduced the practice of publishing "Contributions from the Department of Pharmacy." The first number is a pamphlet entitled "On the Addition of Organic Acids to Unsaturated Hydrocarbons." The author is Arthur L. Sievers. Another bulletin in the series is now on the press and will soon be issued. These "Contributions" will be devoted to theses written by undergraduate and graduate students of the department of pharmacy of the university.

QUERIES

Information is given in this department under the following conditions only: (1) No queries are answered by mail; (2) queries must reach us before the 15th of the month to be answered in the BULLETIN of the month following; (3) inquirers must in every instance be regular subscribers; and (4) names and addresses must be affixed to all communications.

Non-freezing Solutions for Automobiles.

H.'s Drug Store.—The automobilist, in the selection of a non-freezing solution, is interested mainly in two things—first, the action of the solution upon the circulating system; and, secondly, upon the ability of the solution to withstand high and low temperatures.

Whenever salt solutions, such as calcium chloride, sodium chloride, etc., are used, two corrosive actions, chemical and electrolytic, take place. Calcium chloride is apt to contain hydrochloric acid, which, if not neutralized, will attack all metals, and directions for its preparation invariably include a warning to test for acidity and to neutralize by addition of an alkali before using. It is, however, a well-known fact that a caustic solution is just as destructive as an acid forming the hydrates of the different metals constituting the circulating system. Chemical action, although very serious, is probably secondary in its destructive effect to electrolysis. The latter action universally occurs where a salt solution is employed and causes a very rapid eating away of the parts.

Glycerin possesses certain characteristics which, to all appearances, would seem to make it an excellent non-freezing agent. It boils at an extremely high temperature and its freezing point can only be reached by artificial means. The cost is a consideration, however, as glycerin is exceedingly high and, unless commercially pure, is apt to contain fatty acids and produce destructive chemical action. It is conceded by leading authorities that it does destroy the rubber connections and after a short period becomes foul, thus necessitating frequent renewal.

Wood alcohol has been greatly favored for this line of work. In the presence of heat and oxygen, however, wood alcohol has a slight tendency to form formic acid, which might in time corrode the parts. It boils at a lower temperature than denatured alcohol, and consequently less of the latter is required, and as the tendency to evaporate is materially reduced, denatured alcohol is much cheaper to use for the purpose.

Alcohol (denatured) is the ordinary alcohol of commerce which has been made unfit for use as a beverage. It has absolutely no corrosive action on any of the metals with which it comes in contact, and its ability to withstand cold is indicated by the fact that it freezes at about -160° F. Its composition is necessarily uniform, because it is manufactured in accordance with a formula prescribed by and under the supervision of government chemists. It contains no solid matter, thus making it unnecessary to filter before

using and eliminating all danger of its clogging the radiator.

20-per-cent solution freezes at about 10° above zero.

30-per-cent solution freezes at about 5° below zero.

40-per-cent solution freezes at about 20° below zero.

50-per-cent solution freezes at about 35° below zero.

Roup Cures for Chickens.

F. B. K.—H. C. Fueller, Grafton, West Virginia, sells granular copper sulphate as a roup cure, coloring it with aniline red. Twenty five-drachm packages sell for fifty cents. The customer is directed on the label to dissolve one teaspoonful in a gallon of soft water. The resulting solution is drunk by the chickens, and their heads are also bathed in it if they are sore.

The following is the formula of a favorite roup remedy. It is put up in a wide-mouth bottle. The sufferer's head is held over it in such a manner as to compel the inhalation of the fumes:

Carbolic acid.....	2 drachms.
Ammonium carbonate (in fragments).....	1 ounce.
Terebene	1 drachm.

The patient should be held up by the feet for a few minutes night and morning, before the inhalation, as a lot of fluid will escape from the mouth and nostrils, affording the medicaments much better access to the diphtheric membranes. Unless the birds affected are particularly valuable, it is advisable to destroy them before the rest of the flock becomes infected.

Roup is a very dangerous and often fatal disease among fowls. It is a germ disease which finds victims among fowls that are debilitated or run down by exposure to cold or dampness, poor ventilation, dirty and lice-infested quarters, etc. The disease usually starts with a "cold in the head." Among chickens this is manifested by sneezing, inflammation of the membranes of the head, discharge from the nostrils which accumulates into thick masses.

Perhaps the most practical way of treating the disease is to separate the unaffected birds, keeping them in new, clean quarters which are dry, airy and wholesome. Disinfect every day with a $1\frac{1}{2}$ -per-cent solution of some reliable coal-tar dip, giving special attention to the feed- and drinking-vessels. The affected birds should be given the same care and in addition the mouth and nostrils should be washed out with a 1-per-cent solution of the dip, using a small syringe or medicine dropper for the purpose. Mix a few drops of the coal-tar dip with the drinking-water, and be especially careful to disinfect the buildings, etc., every day.

Casein Massage Cream.

F. W. D.—The following formula devised by Mr. Cooban has been commended considerably:

Skimmed milk.....	1 gallon.
Hydrochloric acid.....	1 fluidounce.
Boric acid.....	1 ounce.
Oil of bitter almond.....	20 drops.
Oil of rose geranium.....	30 drops.
Oil of sweet almond.....	$\frac{1}{2}$ fluidounce.
Solution of carmine.....	sufficient to tint.

Add to the milk one gallon of hot water—hot enough to raise the temperature to about 80° F. Mix the hydrochloric acid with one pint of water, and add this to the diluted milk slowly, with constant stirring sufficient to completely coagulate the casein, which separates in a finely divided condition. Allow the mixture to stand for an hour, collect the precipitate on cheese-cloth, and after draining return the mass to the vessel and add two

gallons of water. Stir the coagulum, breaking up any masses that may form; pour off the water and wash again. It is necessary that all of the acid and whey be washed out of the casein. Collect on strainer and squeeze out all the water possible, then transfer to a mortar or other suitable vessel and incorporate the boric acid. Transfer to a cheese-cloth bag, suspend this from a shelf or other suitable place, and allow it to hang for thirty-six to forty-eight hours, squeezing the bag occasionally. The mass contracts and forces water from itself, and it will take about two days to get it all out.

The casein will then be found quite dry and granular. Transfer it to a mortar, rub it as fine as possible, put in about one ounce of dilute alcohol (enough to moisten), and then add the oil of sweet almonds and perfume. Tint the product with the solution of carmine. Add sufficient water to form a soft paste, beat all together until uniformly mixed, and then run through a paint mill and bottle it at once, or else put it up in collapsible tubes. It dries out very rapidly, and must be put into packages immediately.

Hydrogen peroxide in a cream soon decomposes, but if you wish to incorporate that ingredient you might try replacing the water with a solution of hydrogen peroxide when making the paste toward the last of the operation. Many other formulas for massage cream have appeared in the BULLETIN before. Consult the annual indexes in the December issues.

Several Questions from One Man.

N. B. submits three queries:

1. "What is the difference between natural and synthetic methyl salicylate?"

The best way to tell the difference between the two is to take a dose or better repeated doses of each. The synthetic product sometimes irritates the stomach owing to the presence of phenol bodies from which it is derived. Natural oil of wintergreen made from oil of birch or oil of wintergreen on the other hand is not so likely to set up a gastric disturbance. Chemically the two bodies are said to be identical, but physiologically the natural salt is more acceptable.

2. "What is an imide in organic chemistry? How can saccharin be termed both an imide and an amine?"

Amines are ammonia in which one, two or three hydrogen atoms have been replaced by alkyl groups, as methylamine, NH_2CH_3 , dimethylamine, $\text{NH}(\text{CH}_3)_2$, or trimethylamine, $\text{N}(\text{CH}_3)_3$. Amides are acids in which the OH group of the carboxyl has been replaced

by the amido (NH_2) group, acetamide, CH_3CONH_2 . (From *Pharmaceutical Chemistry* by Stanislaus and Kimberly.) The NH group of dimethylamine, or the secondary amine is known as the imide or imido group. The formula of saccharin is:

This is an amido compound in which the OH of the carboxyl radical has been replaced by an amido group. It is not an amine because the hydrogen of the ammonia has not been replaced by an alkyl group. Nor can it be called an imide because that term implies an NH group in combination with an alkyl radical. In saccharin the NH group is not combined with an alkyl. Saccharin is an amide-anhydride or benzoic sulphinide. It is made from ortho-sulpho-benzoic acid.

3. "On a prescription calling for 'neutral mixture' I dispensed liquor potassii citratis, U. S. P. Was that proper? The patient called for refills several times, which would indicate that I had dispensed the right thing. The doctor lived too far away to be consulted."

"Neutral mixture" is solution of potassium citrate. The prescription was filled correctly.

Removing Silver Nitrate Stains.

J. G. wants a method for removing a stain produced by silver nitrate and pyrogallic acid.

1. In the manipulation of the silver nitrate bath solutions in photography, the operator frequently receives stains of the salt upon his clothing. Stains or marks of any kind made with the silver or bath solutions may be promptly removed from the clothing by simply wetting the stain or mark with a solution of bichromate of mercury. The chemical result is the change of the black-looking nitrate of silver into chromate of silver,

DRUGGISTS ON AN OUTING.—Here we have the members of the Westchester County (N. Y.) Pharmaceutical Association at a meeting held some weeks ago at Rye Beach. They look as if they were enjoying themselves!

which is whiter, or invisible on the cloth. Bichromate of mercury can be obtained at the drug stores.

2. Apply this mixture: Sodium sulphite, 1 ounce; chloride of lime, $\frac{1}{2}$ ounce; water, 2 ounces. Mix. Use a nail-brush.

3. Dip the fingers into a strong solution of cupric chloride. In about a minute the silver will be converted into a chloride, and may then be washed off with sodium hyposulphite solution.

4. Bichloride of mercury, 5 grammes; ammonium chloride, 5 grammes; distilled water, 40 grammes. Apply the mixture to the spots with a cloth, then rub. This removes, almost instantaneously, even ancient stains on linen, cotton, or wool. Skin stains, thus treated, become whitish-yellow, and soon disappear.

A Rheumatic Formula.

E. C. M. submits the following recipe for a rheumatic preparation:

Fluidextract of colchicum seed...2 fluidrachms.
Potassium iodide.....6 drachms.
Sodium salicylate.....1 $\frac{1}{3}$ ounces.
Oil of gaultheria.....1 $\frac{1}{2}$ fluidrachms.
Alcohol sufficient to cut the oil.
Fluidextract of cimicifuga.....6 fluidrachms.
Potassium acetate.....1 $\frac{1}{3}$ ounces.
Tincture of hyoscyamus.....2 $\frac{2}{3}$ fluidounces.
Syrup of sarsaparilla compound enough to make
1 gallon.

Let the mixture stand a few days and filter.

The querist requests us to criticize the formula as to ingredients and quantities used. He says further: "I would like particular advice as to the vehicle of syrup sarsaparilla compound. Would you advise a cheaper vehicle than this? Would you consider root-beer extract any value in the above preparation? Would you sell it locally in 4- or 8-ounce bottles? Which would you consider the more popular—a 4-ounce package sold for 50 cents or an 8-ounce package for 75 cents or \$1.00?"

We don't feel competent as pharmacists to give advice on the therapeutics of a rheumatic formula. But this much is certain. We should advise the omission of the narcotic hyoscyamus in a preparation that is intended for popular sale over the counter. You had better leave it out. Syrup of sarsaparilla compound is undoubtedly a better alternative base than root-beer extract would be. The latter has no medicinal properties. The value of cimicifuga is questionable. It does no harm, but on the other hand we are not sure that it does any good. We are inclined to believe that the cimicifuga can be omitted without detracting from the value of the medicine. The size of the package must be determined by the character of the locality in which it is sold. While we are not acquainted with the vicinity of your store, in a general way we should be inclined to favor the sale of a 6- or 8-ounce mixture for 65 or 75 cents a bottle.

The Percentage Composition of Solution of Ferric Chloride.

J. K. writes: "Kindly explain why the Pharmacopœia says solution of ferric chloride should contain not less than 29 per cent of anhydrous salt corresponding to 10 per cent metallic iron. How do you find that the preparation contains 29 per cent of an-

hydrous ferric chloride corresponding to 10 per cent metallic iron?"

To answer the last part of the query first, the following equation shows that 29 per cent of ferric chloride contains 10 per cent of metallic iron. The molecular weight of the salt is to the atomic weight of the metal as 29 is to X. Or $161.04 \div 55.5 = 29 \div X$. $X = 10$.

To determine the percentage of ferric chloride in the solution, the molecular weight of ferric chloride is to the atomic weight of iron as X is to 125 (125 being the amount of iron in 1000 grammes of U. S. P. solution). Or $161.04 \div 55.5 = X \div 125$. $X = 362.7$ or 36.27 per cent metallic iron. But the disparity between our figure 36.27 and 29, the latter being that given in the Pharmacopœia, is to be explained by the fact that some of the iron does not go into solution because insufficient hydrochloric acid is used. The iron is in excess. After pouring on 420 grammes of HCl (only 133.98 grammes of absolute acid) on the 125 grammes of iron, the solution is boiled and filtered. In this first step ferrous chloride is formed as follows: $\text{Fe}_2 + 4\text{HCl} = 2\text{FeCl}_2 + 4\text{H}$.

Good Formulas for Making Cold Cream.

W. E. Q. writes: "Please give me a good formula for cold cream, white and fine-grained. I want something that will stand a summer temperature of 100° to 110° Fahrenheit."

Here is a simple but elegant preparation contributed to the BULLETIN by H. B. Molyneaux, of Omaha, Nebraska:

Paraffin250 grammes.
White wax.....260 grammes.
White paraffin oil or liquid
 albolene.....990 grammes.
Sodium perborate.....10 grammes.
Distilled water.....380 grammes.
Perfume, q. s. to suit.

Melt the paraffin and wax at the lowest possible temperature, and then add the paraffin oil. If this addition causes the wax to congeal, continue the heat while stirring sufficiently to remelt the mass. Now add the sodium perborate to the water and slightly warm the solution. Then add this to the wax solution in a continuous stream as large as a finger; at the same time briskly beat the emulsion with a wooden paddle until it becomes smooth. While the mass is in a semifluid state, incorporate the perfume. Then run the cream into the containers.

Pouring the cream into the jars while in the melted state gives the surface a glossy, satin finish on cooling. Don't fill the containers so full that the cover comes in contact with the top of the cream. For a perfume use oil of rose or a synthetic violet like "irol synfleur."

Val. Schmidt, of San Francisco, has found the following formula perfectly satisfactory:

White wax, spermaceti, of each $5\frac{1}{2}$ ounces; Russian mineral oil, pure white, 30 ounces, troy; distilled water, 12 fluidounces; pure borax, $2\frac{1}{2}$ drachms; otto of roses, 30 drops.

Melt the wax and spermaceti over a slow fire in a large porcelain evaporating dish; tare, and weigh the oil into it; then apply a gentle heat until clear. Dissolve the borax in the distilled water, previously heated to 150° F.; allow the wax, spermaceti, and oil to cool to about the same temperature; add the solution of borax *all at once* and stir briskly for a few minutes, then add the otto of roses, continuing the stirring until cool.

When thus prepared the product is a snow-white, elastic, creamy-looking ointment, which will keep almost indefinitely. This cream may be poured into suitable containers while still quite warm without impairing its texture.

A Kidney and Liver Remedy.

E. C. M. submits the following preparation for criticism:

Powdered buchu leaves, short.....	12 ounces.
Powdered dandelion root.....	12 ounces.
Powdered juniper berries.....	8 ounces.
Cut pareira brava.....	8 ounces.
Cut stone-root.....	8 ounces.
Potassium acetate.....	12 ounces.
Cut mandrake.....	4 ounces.
Syrup of gaultheria.....	16 ounces.
Alcohol	2 pints.
Water, sufficient to make.....	1 gallon.

Macerate twenty-four hours; filter to 7 pints. Add syrup to make a gallon. Let the preparation stand a few days and filter.

The querist goes on to request that we criticize the formula as to ingredients and their quantities. He also asks: "Is gaultheria sufficient for an aromatic? Would it be advisable to charge 75 cents or \$1.00 for an 8-ounce bottle? Would you favor putting up a 4-ounce bottle for 50 cents? How would you improve the formula?"

We are not medical experts and are hardly in position to give advice on the therapeutic value of the foregoing formula. But we see no objectionable ingredients in the mixture. It is a question whether there is enough mandrake in the preparation to do any good. As for the flavoring agent we advise the use of the spirit or oil of gaultheria. The syrup of gaultheria is hardly sufficient to impart the desired flavor to the mixture. The size of the bottle to be dispensed will depend entirely on the character of the locality in which it is to be sold. It is questionable whether you could sell much of the preparation for \$1.00. We should be inclined to favor putting up an 8-ounce package for 65 or 75 cents. Fifty cents a bottle is a little too cheap, and a dollar in many instances a little too dear, so that it might be well to strike a price midway between the two.

Unavoidable Discoloration.

R. B. C. submits the following prescriptions. He has had trouble with them and does not think that they can be filled successfully:

Codeine sulphate.....	5 grains.
Caffeine citrate.....	20 grains.
Ammonium iodide.....	20 grains.
Bismuth subnitrate.....	100 grains.

Mix and make 20 capsules.

Codeine sulphate.....	5 grains.
Caffeine citrate.....	20 grains.
Ammonium bromide.....	20 grains.
Bismuth subnitrate.....	100 grains.

Mix and make 20 capsules.

These two powders become discolored owing to the presence of bismuth subnitrate, ammonium iodide, and citric acid. The discoloration cannot be avoided.

Pills Too Big to Go Down!

P. D. C. received the following prescription to be dispensed in pill form. The querist did his best, but the pill was too large to be swallowed:

Salol	1½ drachms.
Oil of cubeb.....	2½ fluidrachms.
Balsam of copaiba.....	3 drachms.
Santal oil.....	1 fluidrachm.

Mix and make 30 pills.

This is a difficult mixture to form into a pill mass since three of the ingredients are liquid. Oleoresin of cubeb and santal oil would soften the salol, which

is the only solid ingredient. Balsam of copabia is soft in consistency. The medication is approximately 14 grains in each pill. To take up the oil in making a pill mass, it would be necessary to use at least 25 per cent of calcined magnesia with water and acacia sufficient to make a mass. The mixture would then have to be seasoned to allow the magnesia to react. This process would produce a pill weighing 22 or 23 grains, and such a pill could not be easily swallowed. We suggest dispensing the mixture in a capsule rather than in pill form. As we have already indicated, this is a bad formula. It consists almost entirely of oils. Salol is softened by oils and practically forms a liquid with them, especially if friction be used.

An Incompatible Mixture.

E. P. C. requests us to comment on the following prescription:

Gold and sodium chloride.....	12 grains.
Ammonium chloride.....	7 grains.
Strychnine sulphate.....	1 grain.
Fluidextract of cinchona.....	3 ounces.
Fluidextract of coca.....	1 ounce.
Glycerin	1 ounce.
Water	1 ounce.

Two drachms in water after meals.

Ruddiman in his book on incompatibilities says that gold and sodium chloride precipitates strychnine sulphate and the alkaloids in cinchona. We do not think that the glycerin would prevent the precipitation. By dissolving the gold and sodium chloride in water and adding an equal weight of sodium thiosulphate a compound is formed that does not precipitate the alkaloids from this mixture. The gold might be reduced on standing for some time. The alkaloids of coca might also be precipitated by the gold chloride.

An Astringent Mouth-wash.

L. J. M. wants an astringent mouth-wash containing zinc chloride, menthol, eucalyptol, etc. He might try this:

Zinc chloride.....	4 grains.
Menthol.....	2 grains.
Eucalyptol.....	1 minim.
Oil of peppermint.....	3 minims.
Oil of cassia.....	20 minims.
Alcohol.....	120 minims.
Water, enough to make.....	8 ounces.

This could be colored with 30 minims of a solution comprising 5 grains of Eaton's "Cherry Red" in one ounce of hot water.

Place the oils on a small piece of cotton in a funnel and pass the water through. To the resulting solution add the zinc chloride. Dissolve the menthol and the eucalyptol in alcohol, add to the solution, mix well, pour in the color, and filter after standing for two days.

Franzbranntwein.

J. F. writes: "Will you kindly publish a formula for Franzbranntwein?"

Franzbranntwein is a German synonym for brandy. In the United States and British Pharmacopœias brandy is called Spiritus vini Gallici. It is also known as Spirit of French Wine; in France it is called Cognac or Eau de Vie. In Germany it is known as Brantwein or Franzbranntwein. For further information see the Dispensatory.

An Effervescent Salt that Does not Effervesce.

A. J. R. writes: "The following mixture is prescribed frequently by a local physician:

Magnesium sulphate.....	1 1/2 drachms.
Sodium and potassium tartrate.....	40 grains.
Tartaric acid.....	20 grains.

"The patient is instructed to take one powder in a glass of water and drink while effervescing. But the salt does not effervesce."

There is no carbonate in the mixture to furnish the carbon dioxide. Furthermore, the formula is not practical for the reason that when sodium and potassium tartrate salt is mixed with tartaric acid, it will throw down a precipitate of insoluble potassium tartrate. Suppose you try the following modification, having first consulted the physician:

Magnesium sulphate, dried and powdered.....	72 grains.
Potassium and sodium tartrate.....	40 grains.
Tartaric acid.....	30 grains.
Powdered sodium bicarbonate.....	40 grains.

Dry all ingredients thoroughly before mixing.

Linseed Oil Soap.

I. E. T.—A linseed oil soap is given in the Pharmacopœia in the official Sapo Mollis or Green Soap. Another formula is as follows:

Linseed oil.....	10 ounces av.
Potassium hydroxide.....	2 ounces av.
Alcohol.....	9 1/4 fluidrachms.
Water.....	sufficient.

Dissolve the potassa in enough water to make 11 1/2 fluid-ounces of solution. Warm the oil in a porcelain capsule, and to it gradually add the alkaline liquid previously mixed with the alcohol. Heat the mixture on a water-bath until saponification is completed.

Just how well these formulas will serve for cleaning automobiles we are unable to say. If the soap is too soft, it can be hardened by adding stearic acid and also by replacing the potassium hydroxide with sodium hydroxide.

Camphorated Chalk.

W. A. L.—This is a refreshing and harmless dentifrice. It should be kept in well-stoppered containers to avoid loss of camphor by evaporation. Several formulas have been given for it, varying in the proportion of the ingredients. The following are used:

- (1) Camphor 1 ounce av.
Precipitated chalk..... 9 ounces av.

Triturate the camphor to powder with a small quantity of alcohol, gradually incorporate the chalk, and pass through a fine sieve.

- (2) Precipitated chalk..... 9 ounces av.
Orris root, powdered..... 2 ounces av.
Camphor 1 ounce av.

Prepare like the preceding formula.

A Veterinary Prescription.

E. D. D. has received the following prescription from a veterinarian and wishes to know how to compound it:

Powdered opium.....	10 grains.
Iron sulphate.....	100 grains.
Iodine crystals.....	6 grains.

Mix and make 20 pills.

Dry the iron sulphate, add the opium, and make a pill mass with glucose. Dissolve the iodine in alcohol before adding to the rest of the formula. Divide the mass into 20 pills. If the pills are not coated, dispense in capsules to avoid the loss of iodine, which might volatilize to some extent.

Foot Powder.

A. J. writes: "Please publish a good formula for foot powder, also one that can be put up in tablet form."

Try this:

Alum	1 ounce av.
Boric acid.....	2 ounces av.
Talcum	4 ounces av.
Starch	6 ounces av.
Oil of lavender flowers.....	15 drops.

Reduce all to fine powder, mix well, and pass through a fine sieve. If a soluble tablet is desired, replace the talc with milk sugar, granulate, and make the tablets by machine.

Artificial Culture of Golden-seal.

L. J. P. and Others.—The Bureau of Plant Industry of the Department of Agriculture in Washington will furnish you a booklet on the artificial cultivation of golden-seal. The government authorities are doing all they can to foster the growing of this drug.

Decolorizing Carbolic Acid.

W. C. A. wants a process for decolorizing reddened phenol.

A good method is to add alcohol to the phenol and then cool the mixture to a low temperature. The phenol will crystallize out in a colorless condition, and the colored alcohol may then be rejected.

A Remedy for Worms in Hogs.

C. D. E. writes: "I am in need of a good remedy for the treatment of worms in hogs. How much santonin and calomel should be given?"

For an adult hog give

Santonin	15 grains.
Calomel	5 grains.

Repeat if necessary.

Removing Silver Nitrate Spots from Marble or Porcelain.

D. & F. have stained their white enamel or porcelain lavatory with silver nitrate. Having tried sulphuric acid and other things without success, they ask our advice.

Try painting the spots with a solution of chlorinated potassa, wash with water, and then apply a concentrated solution of sodium hyposulphite. This process is used to remove silver nitrate stains from marble.

Glycerin, Benzoin and Rose-water.

W. A. S.—We have published several methods of making this familiar lotion. We refer you to the BULLETIN, October, 1907, page 427; July, 1908, page 297; December, 1908, page 516; and February, 1908, page 71. Two methods of dispensing this mixture are also given in our book entitled "350 Dollar Ideas for Druggists."

Shampoos.

F. S. B.—A good formula for a liquid shampoo will be found elsewhere in this issue in the Department of Practical Pharmacy. Also consult our annual indexes in the December numbers. Two formulas appeared on page 525 of the December BULLETIN for 1910.

BULLETIN OF PHARMACY

Vol. XXV.

DETROIT, MICH., DECEMBER, 1911.

No. 12.

THE BULLETIN OF PHARMACY

Issued on the first of every month by

THE MONTH'S HISTORY

THE PHONE BOOTH A MONEY-MAKER.

Telephone conditions in Philadelphia seem to be very gratifying, and they well illustrate what can be done when the druggists of a city grapple with the telephone situation in earnest. When the telephone companies are first urged to install slot 'phones in drug stores, they are likely to be indifferent, but it almost invariably follows that in time they become quite as enthusiastic as the druggists themselves if the scheme is once adopted. Thus we find the Bell Company in Philadelphia now endeavoring to propagate the slot 'phone idea and to induce druggists to increase their business.

At a recent meeting of the P. A. R. D., David J. Reese, chairman of the Telephone Committee, submitted a letter which he had

received from the Bell Company. From this it appears that there are 810 Philadelphia drug stores in which pay stations are located. In 480 cases the druggists receive a commission of 33 1/3 per cent. In the remaining 330 cases the commission is only 25 per cent because the daily receipts are less than 50 cents. The Bell Company is anxious to have the latter group of 330 druggists so increase their business that they will be earning 33 1/3 per cent commission. In order to do this they would be required to reach receipts of \$180 a year.

At present their average is \$140 per annum, and their total yearly commission is \$21.50. If they would increase their business to \$180.00 per annum, and thus enlarge their receipts only to the extent of \$40.00, their commission would jump from \$20.50 to \$42.00. In other words, it would be doubled, and they would be earning 50 per cent on this additional \$40.00 of business! Furthermore, of these 330 druggists, there are more than a hundred whose yearly business runs from \$160.00 to \$179.00, and who now receive an average commission of \$26.50 per annum. It would only take a slight increase in receipts to reach the \$180.00 figure, in which event their commission would jump from \$26.50 to \$42.00. These men would earn about 100 per cent on the additional business they did up to \$180.00 a year!

The Bell Company is very anxious to have all of the druggists in Philadelphia so develop their telephone receipts that they will be placed in this way under the 33 1/3 per cent commission. How can this increase in business be effected? The company believes that the best and the simplest method lies in the use of booths. In ten cases where booths were installed to succeed open instruments, the monthly receipts jumped from \$15.00 to \$24.00, from \$29.00 to \$52.00, \$46.00 to \$94.00, \$26.00 to \$40.00, \$19.00 to \$39.00, \$25.00 to \$46.00, \$12.00 to \$22.00, \$105.00 to \$175.00, \$65.00 to \$140.00 and \$24.00 to \$52.00. In ten other cases, where window booths with the

proper signs had been installed, the increased business was still more surprising.

All of which illustrates that the telephone booth certainly helps the telephone business very materially. Another lesson to be drawn from these facts is this, that many druggists, with a little thought, could so increase their telephone receipts as to get a larger commission and thus considerably develop their earnings.

* * *

MORE DRUG EXAMINATIONS IN NEW YORK.

The sensation developed by the *New York World* a few months ago has died out, but in the meantime we find that the city board of health is beginning what seems to be a systematic inspection of drug stores. It has asked for a special fund for the purpose of making a drug investigation. So far 60 specimens out of 400 have been declared to be below standard, and 46 of these consisted of magnesium citrate containing in some instances a mere trace of tartrates.

The New York Retail Druggists' Association seems quite indignant, and it has been discussing ways and means of protection against the aggressions of the board of health. Some of the members have even suggested that redress might be found in legislation! It seems to us that about the best defense would be to carry nothing but good drugs—and then tell the board of health to do its worst! Fortunately the 60 instances of dereliction already discovered by the board are unimportant in character—that is to say, the variations from the standard have been very slight and insignificant.

Druggists may just as well realize that from now on, and practically all over the country sooner or later, they will be under more or less strict surveillance. We are entering more and more as a country upon an era of pure food and drug reform. The only wise thing to do is to read the handwriting on the wall—and then obey it!

* * *

SOME SHORTCOMINGS.

Charles M. Ford, drug inspector for the State of Colorado, pointed out to the druggists of Denver some of their shortcomings at a recent meeting of the local association. Explaining that Castile soap is a phar-

macopœial term, he declared that any article bearing this name which is not a compound of olive oil and soda may not be legally sold in the State. He spoke particularly of one brand of Castile soap which is largely sold, but which is made from cocoanut oil, and is therefore unsalable under the name of Castile soap.

He reported that in most of the drug stores of Denver the only calcined magnesia carried in stock is that made "for technical purposes." This substance is evidently being employed for the preparation of solution of magnesium citrate and for other medicinal purposes. Mr. Ford declared that such a condition of things was reprehensible, and that technical magnesia contained such impurities as aluminum, calcium, zinc, and other bases, and was therefore unfit for drug-store use.

Somewhat surprising was his statement, too, that Seidlitz powders were often inaccurately or carelessly weighed. He said he had examined a box of Seidlitz powders made by the A. D. S. and found the contents of the blue papers weighing from 9.6 grammes to 9.8 grammes, whereas they should have weighed exactly 10.33 grammes. The white papers, on the other hand, weighed from 1.94 grammes to 2.29 grammes. They should have weighed 2.25 grammes precisely. Mr. Ford explained that if the acid and alkali in Seidlitz powders are not accurately weighed so as to produce a perfect chemical reaction, the medicine is unpalatable and inefficient.

* * *

REGARDING THE VENDER.

Apparently the chief feature of the recent "get-together meeting" in Cincinnati was an address by Prof. George B. Kauffman, the well-known dean of the School of Pharmacy of Ohio State University, on the itinerant medicine vender. Professor Kauffman availed himself of this opportunity to ask for the support of the medical profession in legislative attempts to curb the operations of venders. A vigorous effort was made last year to put a bill through the Ohio legislature, and Judge Errant even went from Chicago to present an argument at the hearing granted by a legislative committee. The bill failed, however, and another effort will be made during the coming winter. In the meantime such physicians as were present at the get-together meeting agreed to give their coöperation, and it seems likely

that the assistance of the State Medical Society will also be solicited.

In this connection it is interesting to report that Frank C. Ullrich, who has for years been chief organizer of the N. A. R. D., and who has therefore been living very close to this subject, has recently expressed his conviction that the itinerant vender cannot be driven out by means of legislation. It has been his experience that the customary type of law, requiring an annual fee of \$100, \$200 or more, simply spurs the vender on to increase his sales, which reacts in making still greater inroads on the business of druggists and other retail merchants. Mr. Ullrich believes that the only hope, so far as legislation is concerned, is to enact laws which entirely prohibit the vender from doing business at all—and such laws are of course not constitutional.

His idea is that the only solution of the problem lies in competition, and we are reminded at this point of an article appearing somewhere in one of the journals during the last few months in which it was described how all the druggists in a given county combined, purchased a horse and wagon, employed a man, and started in the itinerant vending business themselves in direct competition with the man who previously had been covering the territory.

Mr. Ullrich, by the way, has retired from the service of the N. A. R. D. and has become sales manager of a firm in Wisconsin.

* * *

THE REXALLITES.

The United Drug Co., comprising the Rexall group of druggists, was able to report considerable progress at the annual meeting held in Boston recently. President Liggett announced that there were now 4500 stockholders as compared to 3600 a year ago. The company did a business last year of \$2,839,328.91, while the sales of the several subsidiary concerns brought the total volume up to \$6,800,000. The auxiliary or side-line features, indeed, seem to assume more prominence than the manufacture of medicinal specialties, for we find that at the annual meeting it was voted to acquire a paper manufacturing plant near Springfield, Mass., and a rubber manufacturing plant in Ohio. The Liggett candy business, too, seems to be developing quite rapidly.

It was decided at the meeting to organize a drug jobbing company in Boston with a chain of branches throughout the country, while so far as the ownership of retail stores is concerned, it was shown that there are now four in Baltimore, two in Columbus, two in Detroit, two in Toronto, five in Buffalo, two in Syracuse, and 17 in New England. To this retail group will soon be added a store in Boston and another in New York. President Liggett says that he intends to make the former "the finest retail drug store in the United States." The latter will be established at the corner of 34th Street and Broadway, and a rental will be paid of \$110,000 a year! Mr. Liggett thought that even if this step would involve a loss of \$50,000 annually it would still be a good advertisement for the company.

* * *

SOOTHING SYRUP SAMPLES.

The local association of druggists in Cincinnati has brought to itself quite a little fame by refusing to distribute samples of soothing syrups. A law was enacted by the State legislature last year making it illegal to distribute samples of medicine from house to house. Since then manufacturers have been endeavoring to get the druggists to make their distributions for them. So far as samples of soothing syrups are concerned, the association discussed the matter at one of its meetings and finally voted unanimously to refuse absolutely to sanction the practice. It was declared that soothing syrups containing narcotic drugs were invariably harmful, and that no member of the association should think for a minute of passing them out to the public. The *Cincinnati Times-Star* subsequently published an editorial commending the druggists for their stand, and more or less was said about it for some time in the other papers.

* * *

AFTER PATENT MEDICINES IN CANADA.

The druggists of the Province of Ontario, Canada, have recently discovered the existence of a somewhat peculiar law affecting the patent medicine industry. It is in the form of an amendment to, or a provision in, the liquor license act, which perhaps explains why it has escaped detection. As a matter of fact, however, it has very little if any connection with the liquor business, but is in effect a

restriction upon patent medicines and druggists' specialties. In a word, this law provides that any medicinal preparation not in the British Pharmacopœia or other recognized standard must, if it contains more than 2½ per cent of alcohol, either have the formula plainly printed upon the container or else deposited in the office of the Provincial Secretary in Toronto. Furthermore, if any preparation is found to contain more alcohol than is required for purposes of solution or preservation, it shall be deemed in violation of the liquor act. The penalties are of course those prescribed for violation of the liquor act, and it would seem that the pharmacists of Ontario are afraid that the provincial authorities are getting ready to see that the law is enforced.

* * *

CLERKS HUNTING FOR A NAME.

The friends of the "National Association of Pharmacologists" will be glad to know that this organization has decided to change its name. The title has never been characteristic of a society of clerks, and the boys have always lost the advertising benefit flowing from the use of an apposite name. The association now asks all of its friends to suggest titles. But why strain for effect? What's the matter with a plain, simple, well-understood name like "The National Association of Drug Clerks?" Everybody will know at once what this means, and isn't that what a name is for? We have a National Association of Retail Druggists. We have a National Wholesale Druggists' Association. Now let us go a step farther and have a National Association of Drug Clerks or a National Drug Clerks' Association. Either will do—and we make no charge for the suggestion.

* * *

FOOD AND DRUG EXAMINATIONS.

It would seem that, despite the recent friction in the Department of Agriculture at Washington, the food and drugs act has been administered with a good deal of thoroughness during the last year. On the tenth of last month a press notice was issued from the office of the secretary showing that the inspection force of the Bureau of Chemistry had collected 9500 official samples of foods and drugs during the year, of which 3280 interstate samples were found to be legal, and 3113 misbranded or adulterated, while 503

check analyses were made to insure that correct results were obtained before recommending action on the samples. In connection with this work 5370 hearings were held, less than half being by correspondence. There were 96,129 floor inspections made of imported products, of which over half were made at New York. A total of 9698 imported foods and drugs were analyzed at these ports, of which number 3085 were adjudged adulterated or misbranded, and 1268 were released without prejudice to future shipments. The miscellaneous samples examined at the branches aggregated 1406, making a total of 18,000 samples.

* * *

Dr. James H. Beal, in order to devote himself to his new position as general secretary of the A. Ph. A., and editor of the official organ, has retired from the chair of theory and practice of pharmacy in the Pittsburg College. Louis Sallbach, already a member of the faculty, has taken over Professor Beal's work.

* * *

After nearly a year of agitation, all but the down-town druggists in Louisville have agreed to close at 9 o'clock every evening in the week save Saturday, during the remainder of the winter. The closing hour on Saturday nights will be 10 or 10.30 o'clock.

* * *

The winter meeting of the American Chemical Society will be held in Washington, D. C., from December 27 to 30. The Division of Pharmaceutical Chemistry will hold several sessions and an interesting programme will be presented.

* * *

The Philadelphia Association of Retail Druggists has petitioned the incoming city administration to have pharmacy represented in the personnel of the Department of Health and Charities.

* * *

The Boston correspondent of *N. A. R. D. Notes*, in speaking of certain practices, says they have "achieved a foothold in the minds of physicians." Think of that from Boston, of all places!

There have been several convictions lately for the manufacture and sale of hydrogen peroxide of a strength below the standard. In some instances the product has been little else than water.

EDITORIAL

PRICE-PROTECTION: A BIG QUESTION.

About the time this issue of the BULLETIN is being mailed the Executive Committee of the N. A. R. D. will be gathering in Chicago for the purpose primarily of deciding upon some form of price-protection which will stand the test of the courts. Careful thought upon this subject during the last few months has brought us to the conviction that, to say the very least, the Committee is facing a problem of great difficulty, even if it is not one which defies solution altogether under the present laws of the country.

The recent decisions of the Supreme Court, supplemented by still later decisions in the lower Federal courts in the bath-tub and General Electric cases, and supplemented also by the now famous Detroit speech of President Taft, make it clear at last that the Sherman act is the very symbol and guardian of free, unrestricted, and untrammelled competition in trade. The act is based upon the old common-law doctrine, and as well upon the time-honored economic doctrine, that the prices which result from the unfettered trafficking of the market place, one competitor underbidding another, and still others underbidding the second until the very lowest point has been reached, are the prices to which the public is entitled; that all unfair and monopolistic profit has thus been automatically prevented; that the consumer gets the full benefit of every progressive cheapening in the cost of production; and that the dealer who by any device whatsoever interferes with the action and interaction of this free bargaining is therefore subverting natural law for his own benefit at the expense of the public welfare.

This, we repeat, is now seen to be the very genius of the Sherman act. There must be no restraint of any sort upon trade. There must be no restraint of any sort upon prices.

Now, then, what leg is left for the drug trade to stand upon in its very laudable desire to frame a price-restrictive plan which will stand the test of validity? Well, Mr. Free-ricks, in an admirable paper contributed to these pages last month at our request, argued

with some show of plausibility that the problem can be solved by indirection. The Freeman-Miles plan, technically called the agency-assignment method, is apparently his remedy. By this device, he explains, the manufacturer retains the ownership of his goods until they reach the consumer. When the dealer, who is merely his agent, sells them at retail, it is therefore he, the manufacturer, who is technically making the sale. And since the manufacturer has the undisputed right, when acting alone and by himself, to sell his goods under any conditions he may elect, he is accordingly violating no law when he refuses to dispose of them except at his own price.

In the interests of the N. A. R. D., and of the drug trade as a whole, we hope this reasoning will hold water, but we fear it will not. To us (and we confess it with real regret) the agency-assignment scheme seems merely a subterfuge, and the Supreme Court in express language declared in the Tobacco Trust decision that:

In view of the general language of the statute, and of the public policy which it manifested, there was no possibility of frustrating that policy by resorting to any disguise or subterfuge of form, since resort to reason rendered it impossible to escape by any indirection the prohibitions of the statute.

Language conveying practically the same message was also contained in the Miles decision. It is true that Justice Holmes dissented from this view, with particular reference to the Miles case, and held that a true agency agreement would render the old Miles plan invulnerable, but his confrères on the Supreme bench apparently did not agree with him.

A court always burrows down beneath the externalities of a situation and searches out the underlying *motive* and *purpose*. Supposing the new Miles plan were to come up for judgment, would not the Supreme Court hold that the *purpose* was the same as in the old plan declared illegal, and that only the *form* had been changed. If there were unfair restriction of price before, was not the same restriction still in evidence? If public policy were injured in the first instance, was it not still suffering the same injury? Was not the essential principle of the Sherman act still violated and ignored?

Now in this free expression of our doubts it must not be assumed that we are defending the Sherman law and are consequently inveighing against any effort to secure price-protection. On the contrary, indeed, we are out of sympathy with the law entirely, and we bitterly regret that it seems to stand like a stone wall in the way of any substantial progress toward price-reform. It is not only the drug trade, however, that is crippled and hampered by the operation of the act. We are simply caught up in the meshes of a situation which affects the industrial life and progress of the entire nation. We are merely playing our small part in a great drama which is destined to occupy the center of the stage for a generation to come, and which will furnish the chief issue for political parties to struggle over in many a campaign.

The Sherman act, and the old economic doctrine upon which it was based, are no longer suited to modern conditions and must sooner or later give way to something radically different. Law is simply the reflection of human progress and should keep pace with it as it advances. The era of fierce, bitter, unrestrained competition has in effect been followed in all the larger industries by an era of coöperation and combination. The benefits have been great, but there have been evils also. Because of these evils there are those who would wipe out the new era and thrust us back 25 years into the old, and this is practically the effect produced by the recent decisions of the Supreme Court. A wiser course, and one more in harmony with the evolution of human progress, would be to retain the new era but to eliminate its evils. It is not necessary to burn the house in order to get rid of the rats. There is much force in the declaration of George W. Perkins that we must keep our modern combinations, but, following the governmental method of supervising the banks and the railroads, we must so regulate them as to protect the public at every step. Regulated combination is far more economical than unregulated competition.

This, then, is really the issue: Shall we go forward as a country into a larger measure of beneficial coöperation, or shall we flout progress and go backward to all the evils and the costs and the enormous wastes and disasters of cut-throat competition? Shall we retain

the Sherman law as a relic of the former period, or shall we substitute for it laws recognizing combinations but penalizing acts of aggression and injustice?

When this question is answered, as it will be with more or less certainty within the next 20 years, the drug trade will know definitely just what it may do in the fair and just restriction of prices. In the meantime, however, it may not be necessary to fold our hands and wait calmly for time and tide to come to our rescue. Perhaps the soundest position for the N. A. R. D. to take in this transition period is that suggested by Mr. Freericks (suggested at least by intimation if not more directly), that a test case of the agency-agreement plan of restricting prices be made as soon as possible in order that we may know positively whether or not it is permissible under present conditions. It is possible that it may not be in conflict with the Sherman law, and it is wise not to give up until we know we've got to.

ROBBING TYPHOID FEVER OF ITS TERRORS.

The startling discoveries in applied medicine are made nowadays in the field of biologic research. Chemistry occasionally continues to furnish something noteworthy, as in the recent advent of Salvarsan, but it remains true that most of the marvelous additions to the *materia medica* of late years have been biological in nature. This is where future progress seems very largely to lie.

Take the recent production of typhoid vaccine, for instance. Here we have a disease which has proved one of the most serious scourges of humanity. Everybody recalls that in the Spanish-American war twelve or fifteen years ago there were far more deaths from typhoid fever than from bullets! Every time there is an epidemic in a town, the grim reaper gets in his work with a vengeance, and the country still remembers the frightful situation at Cornell University a few years ago.

It is a little early yet to predict definite results, but already it would appear that typhoid vaccine almost entirely does away with the disease when used as a prophylactic or preventive. As a curative it has not been conclusively shown to possess value, but when

employed as an immunizing agent, its disease-protecting character is little less than astonishing.

So far most of the experiments have been conducted upon the armies of various countries. The statistics are enormous in extent, but it may not prove uninteresting to mention just a few figures. Thus Major H. J. Buist, of the Medical Corps of the British Army, submits a report touching upon 4884 men living under exactly the same conditions. Among those vaccinated there occurred 2.66 cases of typhoid per thousand; among those not vaccinated the incidence of the disease amounted to 6.48 per thousand. Leishman, giving another and more gratifying set of figures in the *Journal of the Royal Army Medical Corps*, asserts that of 6610 men not vaccinated, there were 187 cases of the disease and 26 deaths. Of 5473 men who were vaccinated (an almost equal number), there were 21 cases of the disease and two deaths.

It is abundantly shown by all the statistics, moreover, that not only does vaccination greatly reduce the number of victims, but it also reduces the virulence of the disease. In other words, if a man does happen to get typhoid after he has been vaccinated, the attack will be much lighter in character, and the chances of recovery will be something like 4 to 1 as compared with unvaccinated victims.

The vaccine was first used in the Boer war from 1899 to 1902. Later on it was employed among the German South African troops from 1904 to 1906. Since then it has been experimented with extensively in the British armies. Comparing these three sets of statistics, it has been discovered that with soldiers exposed to exactly the same conditions, the percentage of typhoid fever in the inoculated was reduced to about one-half in the Boer and German campaigns, and later on to about one-seventh in the British experiments. Furthermore, as we have already indicated, the disease, when contracted by inoculated subjects, ran a much milder course, so that the total mortality rate for the inoculated was reduced in the Boer war to about one-third, in the German experience to about one-fourth, and in the more recent British experience to less than one-tenth. Later experiments carried out on a

vast scale in our army and elsewhere indicate that under conditions of peace, with vaccine and methods superior to those first employed, the use of typhoid vaccine may be expected to reduce morbidity at least six-sevenths and mortality nine-tenths! In other words, six men out of seven will be perfectly protected who would otherwise contract typhoid, and nine out of ten will be saved who would otherwise die.

Is this not a remarkable triumph over a disease against the attacks of which heretofore there has practically been no protection?

Typhoid vaccine is now available on the market, and druggists who deal in biological products will in the future need to carry it in stock if indeed they do not already have it. The vaccine is practically composed of the dead bacilli, first grown and then killed under certain careful conditions, and preserved through the use of trikresol. A rubber-stoppered glass bulb of the vaccine, for instance, contains 1000 million bacteria, sterile and ready for use. Think of it—one thousand million germs! And yet we have been made perfectly familiar with these stupendous numbers by the production of similar vaccines during the last few years. All of these bacterial vaccines are used on the theory that by injecting into the blood a relatively small number of the dead germs which in this condition are incapable of producing the disease, you stimulate the body to develop its native powers of resistance against that particular malady, and by increasing the amount gradually until several doses have been given, you develop this resistance to the maximum.*

Careful observers point out that not only should typhoid vaccine be used everywhere in navies and armies, but also in communities suffering from an epidemic, and in families where a case of the disease exists. In some instances a mild reaction follows the administration of the product, and its use is contraindicated with persons not in good health. Properly employed, however, the untoward results are insignificant, and many patients experience no ill effects whatever even of a transient nature.

*See editorial on "Bacterial Vaccines" in the BULLETIN OF PHARMACY, November, 1908, page 446.

THE HALL OF FAME

THE NEW MEMBER OF THE N. A. R. D. EXECUTIVE COMMITTEE.

The executive committee of the National Association of Retail Druggists selected at the Niagara Falls meeting was identical with that

J. ARTHUR BEAN.

of last year except that Charles F. Mann, positively refusing a reelection, was succeeded by J. Arthur Bean of Boston. "Bean of Boston"—this verbal connection furnishes a strong

Mr. Bean's store is in the first building at the right.

temptation to punning, but we courageously resist! Besides, there is nothing baked or half-baked about this Boston product. He is a fresh and energetic specimen of the East, and he has made a particular record in propaganda work. We are showing his portrait

this month, and we are also printing a photograph of the block in which Mr. Bean's pharmacy is located. As everybody knows, the members of the executive committee of the N. A. R. D. are now Charles H. Huhn, chairman, H. B. Guilford, Henry W. Merritt, J. Arthur Bean, A. E. Zuber, and E. H. Thiesing. H. C. Shuptrine, president of the N. A. R. D., and Thomas H. Potts, secretary, are of course *ex-officio* members of the executive committee also.

THE PRESIDENT OF THE W. O. N. A. R. D.

Mrs. Charles A. Storer, of Chicago, was elected president of the Women's Organization of the N. A. R. D. at the Niagara Falls meeting in September. She succeeds Mrs. W. E. Lee, who held the office for a number of years, and

MRS. C. A. STORER.

who is now secretary. Mrs. Storer has always been prominent in the work of the organization, and has been a leading figure from the first in the work of the Chicago branch.

SURPRISING MR. MEYER AT HOME.

A very pleasant incident developed at the office when Mr. Theo. F. Meyer, president of Meyer Brothers Drug Company, St. Louis, Missouri, returned from his recent Eastern trip, where he went to attend the meeting of the National Wholesale Druggists' Association. The employees of the house, desiring

to express their pleasure at the honor recently conferred upon their chief by the N. W. D. A. in electing him president of that organization, arranged for a demonstration upon his arrival at the office.

As Mr. Meyer is an early riser, and is usually at his desk long before the opening hour, it required no little diplomacy to so arrange matters as to keep him away from work until the time set, 8.15 A.M. Fred M. Odena, the genial and diplomatic representative of Parke, Davis & Co., of Detroit, Mich., who is a very warm personal friend of Mr. Meyer, happened to be in the city and very kindly accepted the task of keeping him away from the office until the appointed time.

At exactly 8.15 A.M., when Mr. Meyer entered the building, he was greeted with round after round of applause, and upon reaching his desk he found an immense bouquet of American Beauty roses fully six feet high, with the following legend on a wide silk ribbon or banner:

"Theo. F. Meyer, President N. W. D. A., 1911-1912. Congratulations of the employees."

The surprise was complete. Fortunately

for the loyalty of the force and the character of the man thus honored. The affair was strictly informal, and after the usual congratulations, business went on as if nothing unusual had happened.

A VICE-PRESIDENT OF THE N. A. R. D.

At the recent meeting of the N. A. R. D. in Niagara Falls S. A. Eckstein, head of the Wright Drug Co. of Milwaukee, was elected

S. A. ECKSTEIN.

third vice-president of the organization. In addition to that Mr. Eckstein is the president this year of the Wisconsin State Pharmaceutical Association. These two positions indicate the esteem in which Mr. Eckstein is held by his coworkers in the drug trade.

THEO. F. MEYER.

Mrs. Meyer, Miss Elizabeth Meyer, and Theo. Meyer, Jr., had all accompanied Mr. Meyer to the office, expecting to go automobiling afterwards.

A demonstration of such warmth, conveying the sentiments of the employees of a house, is seldom witnessed, and it speaks much

Sterilizing Morphine Solutions.—

A. Lesure says that in sterilizing solutions of morphine salts by heat, the morphine is partially oxidized and the solution thereby discolored. He recommends that for solutions which are to be kept in stock, the bottle be first rinsed with acidulated water, then filled completely with the solution, and then sterilized in an autoclave at 120° C. for twenty minutes.

Other Worlds and Ways.—

Professor Thomson says that the temperature of the sun is about 6000° C., of Mercury 194° C., of Venus 95° C., of the earth 17° C., and of Mars —38° C. The Martian temperature he suggests is bad for the canals. He calculates that the radiant energy given out by the sun is equal to about 15,000 horsepower per square foot.

Robert Clarkson, 213 South Sixth Street, Springfield, Ill., has a glittering, well-stocked, up-to-date establishment. Notice the Bangs tables in the center and the modern all-glass show cases on either side. Ladders run up to the wall cases between the top of the fixtures and the ceiling.

Bert Finney, Bismarck, N. D., is a member of the State Board of Pharmacy of North Dakota, and is known among the druggists of that region of the country as a hustler. Last year Mr. Finney was president of the State association. His pharmacy is illustrated in this view.

H. H. Cassles, of Canyon, Texas, who contributed a "Best Advertising Scheme" to the November BULLETIN, is the owner of this store. Mr. Cassles himself is the third figure from the left.

Here we have Mobb's "St. Louis Drug Store," at 370 Central Avenue, in the well-known health resort of Hot Springs, Arkansas. The picture was taken by one of the clerks, Frank C. Whitney.

The Co-operative Drug Co., 14 West Centre Street, Logan, Utah, has an unusually attractive pharmacy. It is under the management of R. S. McAllister.

Here is another view of the establishment of the Co-operative Drug Co., showing the well-arranged prescription desk at the rear of the store. The all-essential sink is near-by.

George W. Hastings of Worcester, Mass., has located this pharmacy on the fourth floor of the Slater Building, and he limits his business absolutely to compounding prescriptions and furnishing sick-room and hospital supplies. A professional pharmacy in fact!

This shows a portion of the dispensing counter in the Hastings pharmacy. The physicians of Worcester have flocked to Mr. Hastings' support, and in the short period of three years he has built up a fine business. His record is most creditable.

Dockum's drug store in Wichita, Kansas, was remodeled, not long since and is one of the largest and most popular stores in the Southwest. The rear half of it indicates the extent to which the soda business has been developed.

A unique feature of the Dockum pharmacy is this "Beauty Shop" on the balcony. The fixtures of the store were furnished by the Quincy Show Case Works of Quincy, Ill., and the fountain by the Bishop-Babcock-Becker Co. of Cleveland.

Here is one of the windows of the Minot Drug Co., Minot, N. D., devoted to the exploitation of the prescription business. The trim was made by Sigurd Sigurdson.

This unique and artistic fountain, done in Mission style, was installed last summer in the store of Boyle & Rowe, Massillon, Ohio, by the Walrus Manufacturing Company.

Some Home-made Show Cards.

The druggist who made these signs contributes a letter on page 516 of this issue of the BULLETIN touching on his methods. Nearly all the cards are 18 by 23 inches in size. The illustrations are mostly magazine-cover designs pasted on and cleverly "touched up" so as to seem a part of the card. This effect is also heightened by selecting ink colors for the lettering like those in the pictures.

DISPENSING "606" OR SALVARSAN.

How to Prepare Ampoules of the Chemical for Intermuscular and Intravenous Injections—A Simple, Clear Exposition of the Process Used by a Detroit Pharmacist.

Druggists are showing considerable interest in the pharmacy of salvarsan, Ehrlich's new cure for syphilis. Among these is Mr. Seltzer of Detroit. He has studied the different

Leonard A. Seltzer.

methods of administering the remarkable drug and has doubtless by experience developed a dispensing technique more or less his own. The neutral suspension of the chemical is not mentioned here because that method of administration appears to be the least approved. The intermuscular method is usually advocated, although the intravenous is used very commonly in Germany. It will be observed that the process of preparing the intermuscular injections is very similar to that employed for intravenous use.

METHOD OF PREPARING SALVARSAN FOR INTERMUSCULAR INJECTION.

The apparatus consists of a one-ounce funnel inverted over a hole in a hot-water bath, and a graduate inverted over a crack in the top of the bath. A test tube is set over the outlet of the funnel, while inside of the funnel

rests a filter paper. All this apparatus is sterilized by the escaping steam.

Pour less than 20 Cc. of water into the test tube and bring it to a boil with a Bunsen burner. Meanwhile file off the ampoule of "606" and empty the content into the test tube. It dissolves immediately. Then take a dropping bottle in which is kept a sterilized 15-per-cent solution of sodium hydroxide.

Drop the sodium hydroxide solution into the test tube drop by drop, giving the dropper a slight rotary motion so that the drops will slide down the sides of the test tube, making that area alkaline. Add just a few drops at first and shake. A precipitate is formed which at first dissolves. On adding more sodium hydroxide, the precipitate becomes permanent, but on continuing the additions the precipitate begins once more to redissolve.

Here one must be careful. When the precipitate is pretty well dissolved, one must avoid an excess of alkali. Indicators are not necessary as the dispenser can tell with his own eye whether the end reaction is about to take place—*i.e.*, when one drop more will make complete solution.

Next take a hot funnel, filter the salvarsan

Apparatus used by Mr. Seltzer for the preparation of salvarsan.

solution and pour sterilized water through the filter sufficient to make 20 Cc. in the receiving graduate.

Suck up the salvarsan with a filter pump into the ampoule. In this operation the am-

poule is open at both ends, one being connected with a filter pump, the other with the salvarsan. Seal the ampoule with a Bunsen burner and the operation is finished.

So much for the preparation of salvarsan for intermuscular injection.

PREPARING SALVARSAN FOR INTRAVENOUS INJECTION.

For the intravenous method sterilize 225 Cc. of normal saline solution. Prepare the salvarsan as in the intermuscular method, but filter it into this warm saline solution instead of a graduate. The saline solution must be free from any specks such as hairs from the filter paper. By using fresh distilled water the necessity of filtering is avoided, and the presence of hairs eliminated. Foreign particles are dangerous in the intravenous solution because they tend to form emboli.

After the end reaction opalescence is apt to set in. For that reason, in preparing salvarsan for intravenous injection Mr. Seltzer makes it a uniform practice to add about six drops of the sodium hydroxide solution in ex-

cess of the usual amount before filtering the solution of the chemical. This prevents opalescence or the formation of particles that may cause emboli. Specks or solid particles are less objectionable in a solution intended for intermuscular administration, but in the intravenous solution they are dangerous.

The ampoule of salvarsan solution shown in the illustration is for intermuscular injection, and is about half the original size. The

Miniature reproduction of ampoule used by Mr. Seltzer to dispense salvarsan.

ampoule for intravenous injection is of the same shape but much larger, having a capacity of 250 to 300 Cc. Mr. Seltzer uses this shape of ampoule for the intravenous solution because it can be easily suspended. A rubber tube connected with a needle is attached to the lower end of the ampoule, and the fluid passes into the vein by force of gravity.

ARE YOU MAKING ENOUGH MONEY?

An Address Delivered upon Invitation Before the Nebraska State Pharmaceutical Association at this Year's Convention.

By HARRY B. MASON,
Editor of the Bulletin of Pharmacy.

I am informed that you are to have papers at this meeting from practical druggists telling in the first place how to buy goods and in the second place how to sell them. But many a man buys closely on the one hand, and sells a large volume of goods on the other, without making anything like as much money as he should. There is a large and important field of study for every merchant between the operation of buying and the operation of selling, and perhaps I can roam over this for a few minutes with some little degree of interest.

GROWING COMPETITION DEMANDS BETTER BUSINESS METHODS.

I want to lay down the proposition first that the majority of druggists do not make as much money as they should. Why? Because as a

rule they are not good enough business men. Either consciously or unconsciously the druggist clings to the tradition that he is a professional man who does not need to be schooled in business methods, and in these days of increasing competition he will find himself pushed closer and closer to the wall if he does not wake up in time.

For competition in a democratic and progressive country like America must always, and will always, grow in severity. It cannot be helped. W. A. Hover, of Denver, Colorado, one of the thinking men in the jobbing line, has recently compiled some statistics showing that the cost of doing business in the wholesale drug trade has gradually increased from 9 per cent in 1878 to 12.85 per cent in 1909. Partially in explanation of this in-

crease he found also that the percentage of sales secured without the assistance of travelers *decreased* from 46.84 in 1899 to 35.5 in 1909.

In other words, what might be called voluntary business fell off so markedly that it was necessary to use more and more traveling men to keep the sales up to a given point. Rather a striking evidence of growing competition!

What is true in the jobbing trade is true also in the retail trade. Among the competitors of the retailer are the department stores, the itinerant venders, and more recently, particularly in the East, the growing number of chain stores in the drug line itself. These forms of competition we shall always have—we cannot hope to wipe them off the face of the earth. They will grow more numerous instead of less numerous, and it is folly to blink the facts. The only thing to do is to look them squarely in the face and make the most of them.

I do not suppose you have been worried very much out here by the chain-store rumors which have disturbed the slumbers of some of the druggists in the East, but you will perhaps recall the sensation sprung on the A. Ph. A. a year ago by President Rusby, who feared that an attempt to monopolize the retail business of the country would sooner or later be made by large financial interests. I myself do not share these fears. I do look, however, for an increase in the consolidation movement in the retail branch of the business just as a similar movement is developing in the wholesale trade here and there throughout the country. This of itself is an outgrowth of competition. It represents an effort to meet opposition. The fundamental purpose is to reduce expenses, prevent duplication of effort, and realize economies of one kind and another. Doubtless in self-preservation druggists themselves will resort to consolidation in limited measure, as they have already done in a number of instances. But, waving this aside, the lesson to be learned from all this increasing competition is this, that the druggist must be a keener and ever shrewder business man in order that he may be in advance of the times and go his competitors one better. It is up to him to keep awake every minute of the day, and I speak of these conditions solely for the pur-

pose of showing the necessity of more aggressive business methods.

The average druggist doesn't study his business as a business. He doesn't know how to practice business economies. He doesn't avail himself of his cash discounts. He doesn't make prompt collections. He doesn't watch his book accounts with creditors. He isn't careful to prevent the accumulation of dead stock. He takes no pains to understand the laws of trade and the peculiarities of the purchasing public. The druggist of the future must study these matters closely. He must realize that he is under the necessity of buying wisely, selling aggressively, and advertising skilfully. He must take annual inventories; he must know his percentage of expense; he must understand his percentage of profit; and he must realize whether a given transaction yields him returns or causes him an actual loss.

FOUR THINGS EVERY DRUGGIST SHOULD KNOW.

Now I want to confine myself to just one phase of this large subject. I have for fifteen years been observing the conditions under which druggists do business; I have visited them frequently in their stores; I have conducted a large correspondence with them; and the journal with which I am connected has examined and commented on hundreds of annual statements from druggists. It is my conviction that a lot of men simply do not know how much money they are actually making, and have never taken the trouble to find out with any accuracy. If they knew the facts they would be very much surprised on the one hand, but on the other they would be in position to make radical improvements. I propose to limit myself very largely to a discussion of how the facts can best be determined.

As I have said on at least one occasion before this, I believe there are certainly four things which every druggist should know about his business, and in repeating these I am quoting briefly from a paper read several years ago:

1. Every druggist should know his percentage expense of doing business.
2. He should know his average gross profit, estimated on the total volume of sales.
3. He should know whether certain impor-

tant lines or departments, like those involving cigars, candy, and soda, are making or losing money for him, and if they are making money, how much.

4. He should know for a certainty what his total annual earnings are from the entire business.

A little later on I propose to indicate how these four things can be easily determined, but first I should like to say a few words about the necessity of having such information. No merchant is in condition to conduct his business intelligently unless he knows what his percentage of expense and his percentage of profit are. These data are of vital significance, and they throw a flood of light upon the business and make improvements possible in a thousand ways.

PERCENTAGES OF EXPENSE AND GROSS PROFIT.

Suppose it costs 30 per cent to do business—30 cents to sell a dollar's worth of goods. Here, then, is a fact which should be considered every time the price is established on an article or line of articles. It is of course perfectly true that one cannot always advance the selling price sufficiently beyond the line of expense. Many "patents" have to be sold at an actual loss, when the cost of selling them has been added to the cost of purchasing them. Many other articles, particularly in cities where the competition of the large druggists and the department stores keeps prices down, have to be sold at very close margins if not at an actual loss. But above and beyond such lines, there is abundant opportunity here and there to establish such selling prices, and to carry such lines, as will counterbalance the losses and make the gross profit average up satisfactorily.

In another paper I have commended, and I want again to commend, the practice of a successful Detroit druggist who aims to make 100 per cent advance on drugs and prescriptions, and 75 per cent advance on sundries. Even at that his average gross profit, based on the sale price, is but 40, the small margins or even losses on "patents" and other goods bringing down the figure greatly. It will perhaps be remembered that Mr. Falkenberg, the Chicago druggist, attained some notoriety in the drug journals a few years ago by insisting that one should make 200 per cent advance on his prescriptions if he desired to get an adequate re-

ward for his time and skill, and if he wanted to have his business as a whole yield him the returns that ought to be realized—and it may be said in passing that Mr. Falkenberg wasn't so far wrong as he might have been.

WHAT THE NET PROFIT OUGHT TO BE.

In general it may be said that there ought to be a difference of at least 10 per cent between the percentage expense and the gross profit—and the ideal should be to attain as nearly to the 15-per-cent mark as possible. The average expense of the average druggist is about 30 per cent. The average gross profit is about 40 per cent—both figures, of course, being based on the volume of sales. If the expenses can be screwed down a point or two, or the profit screwed up, or if both feats can be performed, so much the better. But at least the two factors should be kept at the respectable distance apart of ten points. As a drug business gets up into fifteen or eighteen or twenty thousand dollars a year, it ought to be practicable in most cases to have a percentage expense not greater than 23 or 25, and in the smaller towns a point lower down than that can be reached.

If the facts could be known, I have no doubt that many druggists would find to their great surprise that they were actually making much less than 10 per cent net. A Chicago druggist, recently persuaded to estimate his percentage expense and his gross profit, was chagrined to discover that one was 32 per cent and the other 36 per cent. Once in possession of the facts he was in position to apply corrective agencies wherever possible, and I venture to say that he will never again be lulling himself to sleep in the fool's paradise from which he was so grateful to escape.

ARE THE DEPARTMENTS MAKING MONEY?

Now the third essential I have stated is that the pharmacist "*should know whether certain important lines or departments, like those involving cigars, candy, and soda, are making or losing money for him, and if they are making money, how much.*"

I have within the last few years seen many letters from retailers throughout the country which have been full of significance, and which, could I quote them, would illustrate and enforce many of the points which I am

striving to make clear. Several of the letters would be found freighted with meaning in this particular connection.

In one case, that of a Cleveland druggist, we convinced him from his annual statement that he was losing money constantly on both his candy and cigar departments. He had kept separate records of these two departments and of the soda business also. From the figures we found that while the cigar trade yielded theoretical profits of perhaps 25 or 30 per cent, he had actually made but 16 per cent, and that, since his percentage expense was 28, he had lost 12 per cent! Just where the leak was I do not know. Once in a while the clerks smoke "on the house." Occasionally cigars are filched from the tops of the cases where some dealers exhibit them. In certain cities competition with the United Cigar Stores Company and other concerns brings the selling prices down below a living profit for the retailer operating under a considerable expense.

The candy department of this Cleveland druggist was seen to yield him a gross profit of only 25 per cent, and so he lost 3 per cent

sales of departments like soda, candy, cigars, and any other line that the proprietor may want to watch for a year or perhaps constantly.

From such records as these the percentage expense is gotten by dividing the annual expenses by the annual sales. Suppose, for instance, you have annual sales of \$12,000 and expenses of \$3600: you know at once, then, that your percentage expense is 30. The percentage of gross profit, on the other hand, is gotten by dividing the annual gross profits by the annual sales. We have assumed annual sales of \$12,000; very well, then, let us assume gross profits of \$4800: we now have a percentage of gross profit amounting to 40. In similar manner the necessary facts regarding the success or failure of certain departments in the store are gleaned from the department records, while the total net earnings of the business are gotten by merely adding the net profits to the proprietor's salary, the latter being figured in the expense account.

Here is a type of ledger which might be used for keeping these business records:

DATE.	SALES.			PURCHASES.	EXPENSES.			CIGARS.		SODA.		CANDY.	
	Cash.	Credit.	Total.		Sell.	Clerks.	Miscel's.	Sales.	Pur- chases.	Sales.	Pur- chases.	Sales.	Pur- chases.
January 1.....													
January 2.....													
January 3.....													

on that. His percentage expense, estimated without his personal salary, was 23, so that the candy department paid little even toward his own salary, and less than nothing toward making his capital productive. It may be said in passing that bulk candy involves a bigger waste than is realized by most druggists. Clerks are often careless in weighing it, and there is a temptation to take a piece now and then, besides handing one to the customer—especially if the latter happens to be an attractive girl.

HOW TO KEEP BUSINESS RECORDS.

Now how are you to find out these four things which I have declared to be vitally essential to every business man? They are easily determined if records are kept of (1) the sales, (2) the purchases, (3) the expenses, (4) the inventory, and (5) the purchases and

As for the original entries, these could be treated exactly as you treat charges or credits for or against customers. Make them in a day-book if you use a day-book; put them on slips if you use slips. Every time you buy a bill of goods, or pay out money for an expense, or figure up the day's sales, or do anything else falling within the scope of these business records, simply enter it as you would when a customer buys goods on credit. In posting from the day-book or the slips, carry the customers' accounts to the regular ledger, and the business records to the special ledger, giving totals only. If it takes you ten minutes every morning to do your regular bookkeeping, it won't take you three minutes more to include this special business bookkeeping. Is it not worth this slight expense of effort? The advantages are great and far-reaching.

A FORM OF ANNUAL STATEMENT.

At the end of the year the wise druggist desires to get his facts together and to draw up some form of annual statement indicating what the year has done for him. Here is a simple system which will answer the purpose, and which I have already suggested on several occasions:

Total sales.	Purchases.	Stock increase or decrease (inventory)	Cost of goods sold.	Gross profits.	Expenses.	Apparent net profits.	Depreciation in fixtures.	Depreciation in accounts.	Total depreciation.	Actual net profits.	Inventory stock.	Inventory fixtures.

The druggist who is able to fill out an annual statement of this kind in detail is in possession of the actual facts regarding his business—facts which he ought not to be without for a single instant if he desires to succeed in this day of ever-increasing competition and ever-developing attention to the science of commerce.

SOME COMMON ERRORS.

Unfortunately, however, many druggists who keep business records of this kind fall into errors of one sort or another. Some of them, for instance, charge freight and drayage against expense, whereas they should be charged against merchandise—for they are properly a part of the cost of the goods. Others fail to include a salary for themselves among their expenses, and thus mislead and deceive themselves regarding their profits. Still others are astonishingly careless about recording the little odds and ends of expenses. It is quite unnecessary to say that the careful merchant should be as particular to make entries of this kind as in making charges against his customers. If he is going to keep business records at all he should keep them accurately. Not long ago, for instance, I examined the statement of a pharmacist and found that, according to the man's own figures, \$457.79 had been spent for expenses and never recorded.

At the end of the year he was just this much poorer than he thought he was.

Another common error is that of failing to write off anything for depreciation in stock, fixtures and book accounts. That this omission seriously affects the figures as to profits and real earnings is patent on the surface. A soda fountain, for instance, undergoes a rapid decrease in value from year to year. With shelving and show-cases the depreciation is less marked. With stock it is a smaller consideration yet—that is, if the druggist keeps his stock moving, as he ought to do. To keep on valuing all these things every year at their original cost is simply to deceive oneself as to the extent of his profits—and self-deception is the most short-sighted and foolish kind. Wise druggists annually “write off” 10 per cent on their soda fountain and at least 5 per cent on their fixtures. A similar depreciation really takes place in the value of the book accounts. Some of them cannot be collected, and to have them represented in the assets at their face value year after year is to practice a method which no good business man would tolerate for an instant.

THE CRIME OF IGNORING INVENTORIES.

The most serious mistake of all, however, is that of failing to take regular annual inventories. No such system of business accounting as I have tried to describe is worth a pica-yune unless it is based on inventory findings. There are thousands of druggists who delude themselves into the lazy and comforting deception that their stock remains the same, and that the money which they have spent for living during the year, plus that on hand at the year's completion, represents the net profit which their business has yielded them. And yet, in my correspondence with druggists, I have been brought in contact with numerous cases where the inventory figures have disclosed annual differences in the value of the stock to the extent of anywhere from \$200 to \$2000, according to the size of the store and the nature of the circumstances. The stock in any store is constantly shifting; the prices are forever fluctuating; the fixtures, and particularly the soda fountain and its appurtenances, are always undergoing depreciation, and the druggist who is not aware of the exact nature and extent of these changes is not in position to know where he stands. He may

fancy his percentage of gross profit to be 40 when in fact it is only 30, and he may consequently be losing money on many transactions which he fondly believes are yielding him good returns. He may be eating up his capital slowly in utter ignorance of it—and ignorance is not always bliss when the awakening comes!

SOME CONVINCING FACTS ABOUT PROFITS.

I have already expressed the opinion that many druggists do not make as much money as they should, and that this is frequently because they really do not know what they are making, and are assuming their profits to be considerably larger than they actually are. To show the great disparity of profits realized by different druggists, let me give the substance of a paper which I read before the Indianapolis meeting of the A. Ph. A. in 1906, and which may be found in the proceedings of that year. On that occasion I presented the data regarding eleven druggists and their incomes. I found, for instance, that the percentage of gross profit ranged from 32 to 51! Let this sink in, gentlemen—gross profits ranging from 32 to 51 per cent! Think of it! Two of the eleven men did just about the same volume of business, and yet one realized a total income of \$4286 a year, while the other made \$7670. There were three others with businesses virtually of the same size, but while two of them secured incomes nearly alike, the third fell short of the others about \$800. Then there was a Chicago druggist, with a business of nearly \$18,000, earning only as much (\$2000) as a Detroit druggist with a business a little less than one-half as large.

Of course you will say right away that the conditions were not equal in these cases, and that it is easily possible for a man in one town, where cut prices do not prevail, to make a good deal more money from a given volume of business than a man in another town could do whose location was less fortunate. But this consideration was taken into careful account in drawing up the schedules, and a comparison was made between druggists who were doing business under practically identical conditions. The differences were therefore due almost entirely to the men themselves and not to external and outside influences. And these differences were so great that I believe they

prove the truth of the statement upon which this paper is based, namely, that druggists are not sufficiently careful commercial men, that they do not know the real facts concerning their business, and that they do not make as much money as they might and would make if they were in possession of more accurate information.

HOW MUCH MONEY SHOULD THE DRUGGIST MAKE?
